An Ingenious Process.—Lebasteur has invented an ingenious process for determining the thickness of iron plates in boilers, or in other places where they cannot otherwise be measured without cutting, which process is described in a French technical journal as follows: "He spreads upon the plate the thickness of which he desires to find, and also upon a piece of sheet iron of known thickness a layer of tallow about a hundredth of an inch thick. He then applies to each for the same length of time, a small object, such as a surgeon's canterizing instrument, heated as nearly as possible to a constant temperature. The tallow melts; and as in the thicker plate the heat of the cautery is conducted away more rapidly, while in the thin plate the heat is less freely conducted away, and the tallow is consequently melted over a larger area, the diameters of the circles of bare metal around the heated point, bounded after cooling by a little ridge of tallow, will be to each other inversely as the thickness of the plates. The process is stated to have given, in the inventor's hands, results of great accuracy.

Skilled Mechanics.

Speaking of the position and prospects of the skilled workman and mechanic, the *American Machinist* remarks:

No matter to what extent the refinement in machine tools may be carried, it is in the end the careful and painstaking operation of the skilled mechanic that must bring the products of these tools to a perfection that will meet the requirements of modern demands. The lathe will not turn so round that, in this respect, its production cannot be improved by the hand work of the skilled machinist, nor will the milling or planing machine produce surfaces so true that he is not called upon to rectify them with file and scraper. Now, as ever, the beautiful finish on iron and steel is the result of the individual effort of the operator, rather than of the perfection of tools.

Years ago, the opinion prevailed to a considerable extent that the services of the highly skilled mechanic would not be so much a matter of necessity in the future as in the past, but those who built on such ground built poorly. The man will always be superior to the machine, and must always see better than he can perform.

One man may direct the efforts of 50 skilled workmen to the production of good work, but 50 men cannot get good work from one unskilled workman. Improved tools and mechanical appliances will simply assist the artisan in the production of fine work, but the greater the refinements of these tools and appliances the greater must be his skill. Instead of relieving him of his responsibilities, which would be in every sense a misfortune, they add to them, which make him, in every way, the better in being able to meet them.

Altogether, the position of the skilled mechanic is in every way satisfactory, in its relation to improved machine production, and the tools and appliances of the future, however refined, can never usurp his place in the industries of the world, nor relieve him of the part he is to play in future mechanical advancement.

Personality in Tools.—An experienced foreman who has an eye for philosophy says that tools apparently partake of the temper of those who use them. A short-grained man generally has nicked bits; the impetuous man broken ones; the lazy man dull ones; the careless man badly dressed ones; the man of one idea one dress for all kinds of work; the soft man can rarely keep the edge of a tool from turning, while the good-natured and even-tempered man always has the best tools in the shop, and is pestered continually by ill-tempered workmen who come to borrow from him whenever they have a particular piece of work to do. It is quite interesting to note the similarity in the temper of the workmen and their tools.

Bearings for Journals.—A well-known and competent mechanic states that he obtains the best results on his swiftest moving journals with cast-iron on cast-iron, and says he is willing also to depend on an emery ground fit. Another, equally competent, says that for exceptionally high speeds, as 4,000 per minute, cast-iron and cast-iron are inadmissible, but he employs untempered steel and hard babbitt-metal well hammered into the box and then bored out. He tried hardened steel boxes and soft steel spindle for that speed, and found that the boxes cut so rapidly as soon to destroy the spindle as well as the boxes.

Steel Displacing Puddlers.—The substitution of steel for iron in the Pittsburg mills is fast taking away their occupation and driving them to seek employment elsewhere. Within the last two years not less than 2,000 men have left that city, having been thrown out of employment by the introduction of machinery for the production of steel. One hundred puddlers left on the 15th inst. for New Zealand to work in a large iron-mill, where the ordinary puddling operations have not given way to the new steel processes.

Galvanizing Wire.—A New England firm has introduced a new process for galvanizing wire. It is claimed that by this new method a thorough union of coating with the body of the wire is secured, and that in every case a smooth, firm surface results. Great softness, tensile strength and uniformity of temper are also said to be obtained in the wire, while the coating itself remains intact after the wire has been tested by severe twisting.

Scientific Progress.

Zylonite—A New Paper Product.

One of the most remarkable uses to which paper has been put of late years, says a contemporary, is the manufacture of zylonite, a substance which, at the will of the manufacturer, may be made in imitation of horn, rubber, ivory, tortoise-shell, amber and even glass. The uses to which zylonite are adaptable are almost infinite, but perhaps the most extraordinary is the manufacture of cathedral windows. The discovery was made by an Englishman named Spills, about 15 years ago, but it was only about five years ago that a company was formed in London for its manufacture. Within the last two years a company has been formed here. The basis of zylonite is a plain white tissue paper, made from cotton or cotton and linen rags. The paper being treated first with a bath of sulphuric and other acids, undergoes a chemical change. The acid is then carefully washed out and the paper treated with another preparation of alcohol and camphor. After this it assumes an appearance very much like parchment. It is then capable of being worked up into plates of any thickness, rendered almost perfectly transparent or given any of the brilliant colors that silk will take. It is much more flexible than either horn or ivory, and much less brittle. Combs or other articles made of it in imitation of tortoise-shell are said to be so perfect in appearance as to deceive the eye of the most practiced workman in that substance. The difference in the materials can be detected only by tests. A plain white tissue paper also forms the basis of celluloid, and the treatment in the early stages of preparation are somewhat similar. The chief difference, however, between celluloid and zylonite is that the former cannot be rendered transparent, and therefore cannot, like the latter, be made to imitate so many different substances.

Influence of the Moon Upon the Earth.

Prof. Ball, the astronomer, tells us that the ocean tides, which are caused by the moon's attraction, operate as a brake upon the rotation of the earth on its axis. The moon is very slowly receding from the earth, and as the earth's daily revolution is being continually retarded, the days are growing longer in the average. The matter is not likely soon to become a factor in determining the time or wages for a day's work, since the day only lengthens about one second every 1000 years. The change, however, is constant, and will go on until the earth ceases entirely to revolve.

Some 50,000,000 years ago the moon was so close to the earth as almost to touch it, and spun around the earth every three hours. It is one of the gratifying facts that while many of these calculations can be made with great exactness, the circumstances are such that an error of a few thousand centuries is of no particular consequence.

The speed of a smaller body around a larger one is retarded as the smaller one recedes. This fact will account for the rapid revolution of several of the satellites of our system. Such satellites are of comparative recent origin—have been but recently thrown off from the planet system which they attend. As they recede, the time of their revolution will increase; and that for two reasons—first, from their greater distance the action of gravity is lessened, and second, because from their greater distance the path of their orbit is proportionately lengthened.

The revolution of Saturn upon its axis is now very rapid. Probably long before it becomes cool enough for habitation, for the reason given above, its day will be increased to quite the length of that of the earth.

Stellar Statistics.—The number of stars visible to the unassisted vision on a clear night is about 3,000. The opposite hemisphere, containing as many more, makes the number that can be seen without a glass about 6,000. These are divided according to their apparent brightness into six classes, called respectively, first, second, third, fourth, fifth and sixth magnitude. Stars so remote as to be invisible to the naked eye are called telescopic stars. These are classified as high as the fourteenth, or higher, magnitude. An arbitrary division has been agreed upon for the convenience of astronomers. Twenty are classed as first-magnitude stars, 65 as second-magnitude, 200 as third, 450 as fourth, 1,100 as fifth and about 4,000 as sixth. The number of telescopic stars is much larger, being reckoned by some authorities as high as 20,000,000.

Alloys of Iron or Manganese, or Iron and Manganese, with Tin.—Messrs. Charles Billington and John Newton, brass-founders, Longport, Staffordshire, claim as their invention the alloying of the before-named metals, and after alloying same, they add them to copper or copper alloys, and call the resulting alloys "ferro-manganese bronze." What they mean by copper alloys is copper and tin, with or without zinc, or copper and zinc, with or without tin or lead, or copper, tin and lead with or without zinc. They know that iron and manganese, either separately or combined, or in the form of "ferro-manganese," have been previously used to improve alloys of copper; but the methods employed have great inconveniences, requiring very high temperature and forming uncertain results. Such objections are, however, obviated by the methods hereinafter described. In putting their invention into practice they have a suitable bath constructed for the melting of tin, and keeping the tin at a given temperature, at which they introduce iron or manganese, or iron and manganese, not previously alloyed. To the iron or manganese they attach wires from a dynamo-machine or battery, and upon completing the circuit, the currents of electricity throws off the iron or manganese, or iron and manganese, into the bath of tin, thereby causing an electro-chemical action between the metals, which causes the before-named metals to alloy with each other in such proportions as may be suitable for required alloys. The percentage of iron or manganese, or iron and manganese, in the before-named alloys, can be regulated with the greatest accuracy.

The Planet Saturn.

The observer who beholds Saturn with even a very small telescope at this time, gazes upon a magnificent picture of astronomical beauty. "Observers skilled in planetary lore," says the *Scientific American*, "see evidences of change and commotion in the ring-girdled orb. Astronomers of high repute think that the rings are drawing nearer to the planet, and will eventually fall upon it. Others of equal renown—and here the evidence strengthens and accumulates—feel sure that great changes are taking place in the dimensions and density of the golden girdle, unique in the universe so far as our observation extends. The theory is generally accepted that the Saturnian rings are made of myriad satellites forming a kind of cloud, that the divisions of the ring are real, and that we see between them the black background of the sky. A different theory finds advocates, who think that the whole ring is opaque, and that the apparent opening is due to the darker shading of that portion of it. If a star could be seen shining through the dark space between the outer and inner ring, the problem would be solved. But no twinkler has thus far made its appearance between the bright boundaries of the golden circlets, and furnishes the indisputable evidence required. The nearest approach to the much desired solution was made in 1707–8, when a star was seen between the rings and the body of the planet, and when Dawes, called the eagle-eyed, saw a small star pass behind the outer edge of the outer ring.

The ball of the planet presents similar phenomena to those observed in Jupiter. There are belts and spots and rifts indicating great disturbances, and the same process of world-making. As, however, the planet is double the distance, the observation is more difficult, and on a smaller scale.

The present is the golden opportunity for a close study of the Saturnian system. Some of our best observers are improving every hour fitting for telescopic work, and tidings coming from the distant orb will quickly be proclaimed for astronomical tidbits are rare in these days, and the discoverer is sure of immortal fame. The Saturnian moon, Mimas would afford a favorable standpoint for observation. It is the innermost of the eight satellites, makes its revolution round the planet in less than 23 hours, and is only 32,000 miles from the edge of the outer ring. A spectator on Mimas would behold the whole system of rings and the planet softly cradled with them, a vision of such sublimity and magnificence that finite fancy is powerless to paint its transcendent loveliness.

Rapid Progress in Electric Science.—The Philadelphia *Ledger* makes the following note of progress in the application of electricity. "Only twelve years ago Professor Tyndall gave his course of memorable lectures in Horticultural Hall. He had with him as a part of his apparatus an arc light. The lamp was regulated by clock-work, and cost probably ten times as much as the lamp made to-day. It was imperfect in every way, the light being very unsteady, and several times got out of order at critical moments. The current was supplied from a voltaic battery, at a cost that precluded its use for any but lecturing purposes. The battery, besides being costly and troublesome, required the constant work of an attendant for a day or two to 'set up,' and it also was very apt to get out of order. Dynamo machines were not unknown at that time, but they too were costly, and for lecturing purposes the battery was considered best. Looking at the display of lamps in the exhibition, and the variety and number of dynamo machines, it seems almost incredible that it is only twelve years since such a man as Professor Tyndall was well pleased, rather than otherwise, to be able to exhibit his poorly regulated clock-work lamp, run by some hundreds of cells in a voltaic battery."

Pure Chlorophyl.—J. Borodin describes, in the journal of the Royal Microscopical Society, what he believes to be the long-sought pure chlorophyl. He obtains it in a crystalline form, by slow evaporation of an alcoholic solution, though he has not yet been able to isolate the crystals. They are doubly refractive, giving a beautiful green sheen in polarized light. Their physical properties differ from those of the dark-green crystals of hypochlorine hitherto obtained.

Eggs packed in well-dried ashes, and so as not to touch each other, it is said, have been kept perfectly sweet for twelve months.

Passing Events

The ordering of a new trial in the famoue Alhion-Richmond mining case is an interesting piece of news for many persons, more especially in view of the opinion of the court concerning the method hy which the former judgment was obtained.

The general newe from hase metal camps is not highly encouraging, as the prices of lead and copper continue so low that some properties which are running are doing so at a loss. The shutting down of the Horn Silver Works in Utah has a depressing effect on the lead industry in that region.

Trinity, Siskiyou and Shasta counties in this State continue to attract more miners than other sections, and many men have already gone to those regions.

The foreign news received during the week is of a tenor to lead to the expectation that war will be declared hefore long hetween England and Russia. As Uncle Sam etands ready to sell provisione and material, the impreeeion prevails that a war abroad will lead to a revival of husiness here for a time at least.

THE Eureka Con. mine is looking and producing well. In fact, the mine is said hy those knowing ite condition to be looking better today than at any time in a year past.

Near Bridgeport.

Record Progress.

It has been too much the custom in the past for experts in mining matters to preserve secrecy in the matter of improvements in mining and metallurgy. Of late, however, a change in thie respect is apparent. Such associations as the American Institute of Mining Engineers have done much to hring ahout this needed change, and various individuals have given to the world the results of experience in special hranches. The publication of "papers" by the memhers of said societies has hrought out discussions in wbich the opiuions and experience of others have been made public, to the general bcn fit of all in the profession.

This change of policy can not be other than heneficial. Men who are thoroughly posted in any special department or branch of mining or metallurgy need not fear too great rivalry because they make public their experience. They hecome more widely known than hefore aud establish their reputatione on a wider hasis. People desiring to make inquiry in these epecialties are directed to them hy those who have rean the publications, so that, instead of losing husiness opportunities, they are more apt to gain them.

As a general proposition any enterprisee of an extended character are not apt to be conducted without men of experience in the different branches. Those persons who have shown themselves to be specially posted in their respective hranches and are known by their writings, are more apt to be called upon to fill positions than men who have kept their knowledge to themselves, and have not identified themselves publicly with these specialties. The exchange of opinions upon interesting subjects must be conducive to individual and public knowledge. The progressive nature of modern industries is sucb that constant improvement is heing made, aud few hranches remain long in the same stage. Each man can learn eomething from another. The best posted individual may learn something of value from practical men engaged in the same pursuits.

And it is not only the case that people write more for the transactions of societies, hut also for the technical journals than formerly; and people who do this hecome well known for their special knowledge, which redounds to their advantage in the end. The editors of the PRESS are alwaye glad to receive communications on subjects of special or general interest, and the readers are always glad to poruse them. Let us hear from you, gentlemen, as often ae you find time to write.

New Mexico Mines.

Owing to the fact that stage travel in New Mexico is slow and often only semi-occasionally, the letters of our representative, Mr. Frank W. Smith, who is doing the eouthern mining districts for the PRESS, come to hand slowly. Elsewhere in this issue will he found a description of Black Hawk, Grant county, New Mexico. This will he followed hy the other districts of that county, also one in Sierra and Socorro counties. The investigations of the PRESS representative show a renewal of activity in New Mexico's mines. New and frequent strikes are numerous in old as well as newly discovered districts. Miners and mining men of the West, especially Californians, will read these letters with interest. San Francisco capitalists are gaining a strong foothold in New Mexico's hest districts. Western men are welcomed hy the people of the Territory, and they are looked to for the future development of the rich mines of this advancing and progressive Territory.

We have of late heen receiving large accessions to our mail list iu Arizona and New Mexico, both of which territories are growing in population and commercial importance. The mining industry in these regions is but in its infancy, for until of late years both Territories have been isolated and offered emall attraction for settlere. The railroads have changed all that and the Territoriee are heing eettled up hy people who have gone there to stay and make their homes. New mines are conetantly being found and opened.

New namee are heing added to the liet of eubscribere of the MINING AND SCIENTIFIC PRESS from other quarters as well. We shall put forth our best efforts, and with our carefully earned reputation iu conducting a mining publication, we expect to improve the paper greetly the coming season, and receive large accessions to our mail list. The PRESS is the only illustrated paper on this coast wbich is devoted to mining and metallurgical matters, and the 25 years' experience of its publishers enables them to puhlish a paper which is of interest and value to its special class of readers.

An Important Improvement in Electrical Appliances.

At the last meeting of the California Academy of Sciences quite a display of electrical apparatus was placed upon the tahles, and a large audience assembled to hear a description of a new system of telegraphy.

The suhject matter was introduced hy the president, Prof. Davidson, statiug that having witucssed the first private exhihition of the new system of telegraphy invented hy Mr. John C. Ludwig, he hegged Messrs. Garnett and Heuston to delay their visit to the East in order to present the apparatus to the inspection of the members of the academy, and to illustrate the connections and relations of the different parts of the apparatus he agreed to make a series of large drawinge. The gentlemen had finally yielded to show this invention to this Academy hefore placing it hefore any other scientific hody.

The president said it seemed to him a etep so far in advance of any taken in recent years that he doubted whether it was not a revolution in telegraphy. In the tests and experimeuts at the first exhihit be had withdrawn the zinc from the hichromate potash until only the lower edge of the zinc, not exceeding a square balf-inch was touching the surface of the fluid, and the generation of tbe electrieity and the transmission of signals were perfect. The sounder at the end of 105,000 ohms (over 5,000 miles) was sharply and instantaneously responsive to the break of the transmitting key, and that when one or more psrsons were placed in the line the same results were ohtained. Moreover, it mattered uothing whether tho line was fine or coarse, and this was a very important element in the capital invested in laud lines and ocean cahles. In the former the thickness may he very greatly reduced; in the latter a coarse, strong wire, or more than oue, may readily replace the delicate seven copper-threaded cables. On cahle work he was satisfied that the sounder could he used as well as on land lines, and that the Thompson instruments and their high royalties would be done away with. He believed that this new departure was only the heginning of much morc extended discoveries which would embrace light and power, and he had lately witnessed experiments in another line which seemed to he only another application of the principles involved. It seemed difficult to understand how the terms current, discharge, etc., could apply in the present case without a special designation of their meaning.

He said that General Heuston would read a short and euccinct paper upon the suhject; that the president would follow in an explanation of the drawings (which we very much enlarged over the eignal sketches), and that the instrument would he then operated and be open to the inspection of the members aud their friends.

General John Heuston then stated that the invention which he wished to bring to the notice of the academy related to an improvement in the art of producing *induced* electric currents for telegraphic and other purposes.

The special object of the invention is to provide strong and highly efficient electric currents for telegraphy, etc., while ohviating the maintenance of large and continuously expensive voltaic batteries and ponderous power-driven mechanical geuerators.

The induced currents produced by this invention are different from those produced hy ordinary induction coils as heretofore used iu telegraphy. They approach morc nearly in character the currents from magnets or dynamo-electric machines, but the mode of tbeir production is very different from that practiced with such machines, in that there ie in it required no movement of any part of the generator—the simple making and breaking of a circuit of a emall battery hy means of an ordinary tranemitting key serving to magnetize and demagnetize an electric magnet, which by its alternations of conditions effects, iu suitable adjaceut coils surrounding magnetic cores, the iuduction of powerful currents, which traveree the line-wire alternately in opposite directions, and actuate relays or other receiving instruments constructed for operation hy such reversed currents.

The generator essentially consists of two permanent magnets of the horse-shoe form, arranged flatwise with relation to each other, and at a suitahle distance apart, one being above the other in the instrument hefore you. Between the permanent magnets near their curved ends stands a hlock of wood or other isolating material serving to keep them separated a proper distance. Each pole of hoth permanent magnets is provided with a projecting soft-iron-pole-piece, the pole-pieces of one magnet extending toward those of the other, and separated therefrom a suitahle distance. Each pole-piecc is surrounded hy a coil of insulated fine wire. The coils of each magnet are connected in a pair hy their inner terminals, and the two pairs are connected together between two similar outer terminals. By this arrangement induced currents simultaneously produced in all the coils hy the north and south pole-pieces, are caused to flow in the same direction. The outer extremities of the other two coils are to he connected to the earth and the line respectively.

The permanent megnets have their poles of oppoeite character arranged opposite each other—that is, the tip of the north pole piece of each magnet faces and is adjacent to the tip of the south pole piece of the other magnet, and in the space between each opposed pair of tips, and also in a limited contiguous space is comprised an intense magretic field. If a piece of soft iron or a magnot were moved through this field athwart and hetween the opposed polar tips, currents would he induced in the coils; hut with a view to obviating the neoessity of moving an amateur with relation to the pole-picces, tbe poles of an electro-magnet have been permanently arranged between the pole-pieces of the permanent magnets, hut eeparated from them by thin interspersed plates of isolating material. This eletro-magnet has coils of large wire, so that its cores will he promptly and efficiently magnetized when said coils are traversed hy an electric currrent. The alternate magnetization and demagnetization of the cores of the electro-magnet affects in an increased degree the purpose which would be accomplished hy moving an armature through or alternately into and out of the magnectic field. In other words the intermittent magnetization of the electro-magnet or hetter still, reversing its magnetic polarity by curreuts alternately in opposite directions through its coils, results in the induction of very powerful currents alternately in opposite directions in the coils of fine wire which surround the pole pieces of the permanent magnets the strength of such currents depeuding on the strengh of the permanent magnets and the size of the wire. A single small-sized hichromats of potassium cell is sufficient battery for all ordinary purposes, and will produce a proper magnetization to induce a current sufficient to overcome a resistance of over 100,000 ohms, whic is the resistance of over 5,000 miles of No. 1 galvanized iron wiro, such as is commonly use in practical telegraphy.

Of course it is understood that in using th reversed currents produced by this generat for telegraphing hy the Morse code a suitab receiving instrument must he used, and such have the pleasure of showing you. This instrument differs from ordinary polarized relays i that there is utilized hut one pole of a perm nent magnet which communicates a simil polarity to the two cores of an electro-magne and in front of these two coree is pivoted a hs anced soft-iron neutral armature, the opposi ends of which are attracted with equal forcs l the two cores when no current traverses the coils. Wheu, however, an instantaneous cu rent traverses the coils in one direction, one the cores will be strengthened and the oth weakened in its attractive power. The etrong will then attract the adjacent end of the arm ture toward it, throwing out the other e against a stop which may he utilized either a sounding-stop or a circuit-closing contact of local circuit. The armature heing thus attract will remain under the control of the attracti core by reaeon of being cloee to it, and unti reverse current ie eent through the coils. Th the operation will be revereed, and the otl core will have the overpowering attraction. will thus be eeeu that although the effect of t

onrrents themselves is hut momentary, they may be utilized for producing movement of ths armature at intervals correepnnding to the dots and dashes of the Morse cods.

After this the inetruments were nperated; the line was broken by five of the membere put in the middle nf the resistance coile.

Tho current was moderately eharp to the track of tho broken ende of tho wires. The battery was less than a half-pint cell for ths main line, and the eame for each local receiver and sounder. Tho key for making alternate pnsitive and uegative connections is quite ingenius, and ie attached to the rear end of the generator which was in a box ahout six iuchee long and four deep and four broad.

Many of the membere afterward examiued the instruments and questioned Mesers. Heuston and Garrett concerning them.

Aaron's Assaying.

Mr. C. H. Aaron, tho well-known metallurgiet (author of "Testing and Working Silver Ores," "Leaching Gold and Silver Ores," and another work on "Assaying"), hae iesued this week parts two aud three of the latter, as a separate pnblication. Part firet wae entirely devoted to gold and silver ores. Parts second and third (in nne volume) refer to gold and silver bullion, lead, copper, tin, mercury, zinc, nickel and cohalt; and there is also an appendix to parts first and third.

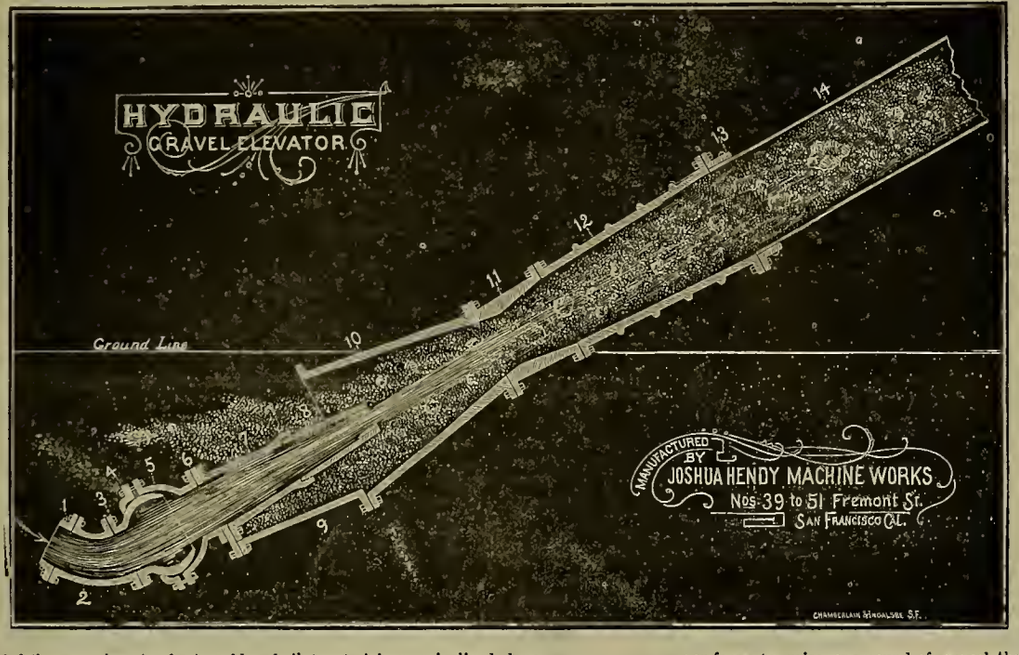
The work, which is puhlished hy Dewey & Co., of the MINING AND SCIENTIFIC PRESS, 252 Market et., comprises eome 160 pages. It is designed not eo much for the use of students who enjoy the advantages of professional instruction, as for that of people who want to assay—whether for husiness or pleasure. The methods and processee are described in plain language, free from chemical formulæ, in a manner to he readily comprehended, which is, by the way, one of the secrets of the success of Mr. Aaron's former works. His descriptione are clear and plain, and there is no mietaking any directions, which, when followed strictly, lead to proper results. The hook will be found of great aid in learning. The price ie eufficiently low to enahle any one interested in such mining or metallurgy to purchase it. The hook is compact and might have been extended to much greater dimenoions —after the manner of many scientific publications—without increasing its ueefulness. It was considered heet to keep it of a convenient size for ready use hy workers.

SOME three or four years ago, when Lewis District was at the zenith of its prosperity, a railroad was huilt from the Nevada Central across the valley and up the canyon to the village. When the camp went dowu the road was abandoned and at one time was considered worthless, except for old iron. Now, a reaction has eet in and Lewie hide fair to he more proeperoue than ever before. The old railroad is heing repaired, and arrangements are heing made to run tri-weekly traine over it to accommodate the freight and passenger trade of Lewis. —*Silver State.*

Hydraulic Gravel Elevators.

We present herewith an illuetration of a "Hydraulic Gravel Elevator," which, in its practical operation, may, in a measure, assist in eolving the great problem of hydraulic miniug, and by the adoption and use nf which the cost of driviug expeneive hedrock tunuele will be dispensed with, tho question of the deposite nf debris be disposed of and new fields nf enterprise hs opened iu the development of the many shallow deposits of auriferoue gravel existing in the mining districts of the world.

The principle upon which the operation of theso hydraulic gravel elevators ie hased is the simple fact, which is well nnderstood hy hydraulic miuers, that water, earth, gravel or any other heavy material can be driven up an incline, ascending plane or hill by the hydraulic force or a volume of water acting under a head or pressure. In a flume it is only necessary to give the impelling water more velocity to cause it to carry more earth or gravel before it. To accomplish this the flume is given a greater descending grade, and it is, therefore, only necessary to give a volume of water more velocity than it hae through an ordinary flume to make it acquire sufficient force to impel before it earth, sand, gravel or any other heavy material up an incliued plane.



This fact euggested the construction of a form of machine which should so confine and direct the inherent hydraulic force of a etream of water acting under preesure, as to move hefore its reeistlees power massee of earth, gravel or other material, and the cut herewith presented illustrates the featuree of the machine devised for the accomplishment of that purpose, and to which the attention of those of our patrons controlling shallow placers is espeoially requested. Their construction consists of an iron pipe having a horizontal ground eection entrance, and throat and auxiliary pipe leading therefrom and upward at an angle of 45° to an ordinary open flume lying ahove and extending heyond the pit or excavation made in the course of the conduot of the mining operations, and into which the water and material impslled through the conduit pipe ie discharged.

This horizontal section is constructed with an open end back of or hehind the entrance and throat of the pipe, into which the hydraulic nozzle is fixed and directed. The open end of this ground section is concave in ehape, or a lower half-eection of the pipe flaring outward, and into whioh the earth, sand, gravel, etc., are sluiced or washed hy emall hydraulic giants, through hedrock flumes leading thereto, the elevator entrance and throat eections heing eet in a pit excavated helow the hedrock surface.

The material sluiced into this entrance is taken up hy the stream issuing from the fixed hydraulic nozzle, which, by its impinging force, impels it forward and upward through the pipe to its point of discharge into the open flume ahove, whence it ie carried away through a line of sluice boxes to a final dump.

Confined as the material is within this tight iron pipe, it is necessarily impelled forward with ths velocity of the stream itself, and as each particle of gravel or other material is directly acted upon by ths full forcs of the stream discharged through the hydraulic nozzle, it is conoiderahly disintegrated hy thie action, as well as hy the friction along tho pips in its ascsnt, and the pulverization is so complete that long and expensive outer flumes or lines of sluice hoxes are rendered necessery.

The impinging and frictional action of the water, earth, gravel, etc., creates the greatest amount of wear upon ths ground entrance and throat eections and at the point of upward curvation of tho pipe, and the maximum amount of such wear is necessarily upon tho under sections; consequently, these sections and the curved portion of the pipe are constructed in half-sections—an upper and lower, with flanges turned out on each side, so that the eeveral sections can be bolted together, and the lower sections becoming worn can be replaced with little trouble and at small coet.

These machines are made of any capacity and will handle any head of water ordinarily used in hydraulic mining.

In the operation of theee hydraulic gravel elevators the primary ohject is, of courss, to have them perform all of the work of which they are capable, and as it requirss no more power to raise one pound of water, the mining operations ehould be so conducted as to endeavor to pips as much earth, gravel, etc., toward and into the entrance ae is possible, as they can eeldom he overloaded.

It is important to bear in mind that it costs as much time and money to raise water through the elevator pipe as it doee earth or gravel, and it requires an equal amount of power or force to raise the one as the other.

The practical operation of these machines has demonetrated the fact that when properly and advantageously set and operated the amount of water and material which can be raieed and impelled through the ascending pipe is governed and limited only hy the volumne of water used, acting under its given head or pressure, and its consequent capacity, force or power to carry the same through the outer discharge flume toward the dump.

It is estimated that a volume of water, under a pressure of 100 feet (vertical) will raiee material 10 feet high; and ae high pressure is more effective than low preseure, 200 feet will raise 20 feet high hetter than 100 will raise only 10 feet, 200 feet will raise say 22 feet, and 300 feet eay 40 feet.

The above data are simply the theoretical impressions of the effective force of certain volumes of water acting under given heads or pressures, hut the actual prectical operations of these hydranlic gravel elevators have demonetrated a far greater effective force.

We are informed that at the property of the Yreka Creek Gold Mining Company, in Siekiyou county, California, a No. 3, 18-inch elevator of the improved form was placed in poeition and operated during a period of nearly three years, and it was there determined that a volume of 650 miner's inches of water operating under a preesure of 266 feet was efficient to eupply two hydraulic giants for hank washing and bedrock sluicing, and as well to supply the elevator and ite accessory water-lifter with all necessary water for their proper operation in raising all ssapags or hedrock water and all earth, saud, gravel, etc., continuously piped to it, to a hight of 47 feet, and could have elevated the same to a hight of over 50 feet with equal facility, aud that at no time during ths conduct of operations was the machine overloaded, and the wear of ite eeveral parts was inconsiderable.

These elevators are menufactured under Letter's patent, hy the Joshua Hendy Machine Works, Nos. 39 to 51 Fremont street, this city, and we are assured that they will be pleased to furnieh such information as they may poseee relative to the construction, operation and practical results to be derived from their adoption and use, thie subject having been made a epecialty hy the managers of these works.

Mine Pointers.

The lighting of coal mines hy electricity has not made any practical progress as yet even in Europe, and many great difficulties will have to be surmounted hefore it will he accomplished.

The Danish system of horing deep holee with hollow rods down which water is forced, and so hringing up the debrie to the surface outside the rods, is said to heve accomplished very rapid work in deep holes.

Mine managers should be careful not to huy steel ropes for hoisting which are very low priced. They should eet their faces against the practice of reducing cost and eo deteriorating the quality of such important articles as hoisting-ropes. Nothing ahout a mine is so important as this, and only the very hest material should he ueed.

In this country too little atteution is paid to having good plans of mines; accurate surveye, accurately put on paper, with a system of contour plans say every ten feet properly plotted. Such records are very useful, not only for carrying on works, but serve as records which may he of service in future explorations. Some few of our large mines pursue this plan, hut the system is hy no means general.

Steady work on a productive mine with plenty of ore will pay hetter in the long run than a rich strike of a emell hunch of ore. Yet, too many miners are looking for the emall, rich hunches. The mines that have paid hest in this State are not those with specimen rock, or those which have showed ore worth $1,000 a ton. The hest paying mines are those which have paid a small profit on each ton, by turning out a good many tons. Prospectors ehould remember this fact.

Of all the mistakes made in mining mattere none have led to more disaetrous results than that of spending large sums on surface improvements hefore actual underground development warranted it. Milling or milling plante, working machinery, wagon roade, tramways, etc., are of course necessary to hig mines, hut it hy no meane is the first necessity for them. There are more instances of wrecks of mining property from heavy surface improvements than from undergrou ad expenditures.

The plan of leasing mines is developing many good onee. Work progressee in many mines that would otherwise he idle, by this system, and men are given employment that pleases them. People in this country prefer to work for themselves where possihle, and thie system is producing very good results wherever in vogue. A few years ago very little mining was done in this country on this plan.

EDWARD ROBERTS made an extensive tour of Alaeka, and in an interview after his return, spoke enthusiastically of its mineral resources. He eays its mineral wealth is beyond computation. Gold of the finest quality exists in unlimited quantities in quartz of the mountains in various sections. The only question remaining to be solved ie its accessibility. Douglass Island, 100 milee NE. of Sitka, ie in the center of mining operations at present. It is owned by San Francisco capitalists, and a 120-stamp mill, the largeet in the world, is in operation. Labor is cheap, and there is no reason, aside from the distance and difficulty of getting at the gold quartz, why Alaska should not supply a large percentage of gold mined in America in the future.—*Sonoma Democrat.*

Sierra County, N. M.

(*Continued from page 266.*)

were paid for was extracted from them, in some instances in ten days. Pay from grass-roots has been the rule rather than the exception about the camp. In no camp on the Pacific Coast has less dead work been done than in this. Every property that has been worked so far has been worked at a profit. The Iron King probably is an exception in this case, as the company has erected a smelter at great cost and a failure of the existence of sufficient lead ores in their own mines, and not being able to secure any quantity from neighboring mines, on account of the little activity in development, the plant has not proved a paying investment.

"Dandy" Prospects.

With but few exceptions the best mines of the camp are owned by individuals. A number of these mines were not only self-supporting but self-purchasing as well. The Black Colt owned by Wilson Brothers and others was bonded for four months, the price being $6,000. The first week's work more than paid for the mine. Several cars of ore that run over 400 ounces per ton have been shipped from the mine.

The Illinois, one of the most extensively developed properties, is owned by Eastern and California men and is systematically managed by Col. A. W. Harris, an old-time Californian. This property demonstrates almost a certainty of the permanency of the mineral bodies. Depth and development has uncovered numerous bodies of high and low grade ores, principally the former. If a continuation of affairs be had at a few hundred feet deeper there will be less of a lottery about the existence of ore bodies and a strong probability of a fissure vein.

The Superior is owned by a stock company, San Francisco people holding the most of the stock. J. B. Hagin, ex-Gov. Perkins, George Hearst and the widow of the late Col. Logan, of San Francisco, being the principal owners. The death of Col. Logan by a recent stage accident proved a sad blow to the interest of the camp as well as a stoppage of the extensive development of the property. The mine has produced considerable rich ore; it is situated on the main mineral belt in the midst of rich and paying mines. No information is given of its workings or stoppages, and if any discoveries are made that would be of benefit to the district it is religiously kept from the public.

Tailings.

The smelter will blow in during this month.

Freights on ore to the railroad at Lake valley is $6 per ton.

The mines of the North Percha, north of Kingston are free milling gold ores and they promise to be opened up quite extensively this season.

The Bullion was bought for $3,500. Some of the ore run as high as $ 25,000 per ton. The Monaska group, on the South Percha, owned by golden Colorado people, have suspended work on account of the death of F. E. Everett, one of the owners.

The one-half interest in the Lady Franklin mine was bonded for four months by the present owners for $6,000. One week's output was sufficient to pay for the interest.

The North Percha district wants a stamp-mill.

Practical milling men could not find a better field for investigation than Kingston.

The Brush Heap mine is one of the wonders of the camp.

Judge Burns and his associats, "Col." Barnaby (the latter of Mark Twain fame), handle a great deal of mining property. Col. B. owns a valuable property adjoining the Lady Franklin.

The Raff Brothers and C. C. Collins are pushing developments on the Lingo, just south of Kingston.

Wm. Harris, a rising young mining and civil engineer, has done some excellent work in the district.

Wilms & Kleiner are developing the Enterprise.

Wagon roads to mines, a sampling works that will buy ores and with more get-up-and-git instead of building castles in the air, will make Kingston a large and prosperous camp.

A concentrator recently erected at Kingston fails to work successfully; the cause is laid to the mismanagement. Another effort will be made to run on this summer.

The Smelter of the Iron King Company is a fine plant. Superintendent Wolf is an old Leadville smelter and his work is a credit to himself, and if he was supplied with ores would be most profitable to the owners.

The hotels are on the European plan, and like the camp the lodging houses are high-grade.

There are no poor mine owners in Kingston, although any number of them are short of means to push development.

A Western practical mining man will not have to investigate this district but a few days to find any number of excellent opportunities to profitably invest his money.

Would-be mining papers and Eastern newspaper "town-hoomers" have gulled both the town and mines of this district.

Sierra county properly belongs on the Pacific Slope, and she is looking to California capital and mining men to develop her resources.

Pueblo, Colo., gets most of the ores of this district for treatment.

There are four assayers in the camp.

F. W. S.

Tantalite and Columbite in the Black Hills.

The following was read by William R. Blake, of New Haven, Conn., before the American Institute of Mining Engineers:

In September I contributed an article upon columbite in the Black Hills of Dakota to the *American Journal of Science*. I had not at that time seen the paper by Professor Charles A. Schaeffer, of Cornell University, upon the occurrence of tantalite in the same region, or I would have gladly made reference to it. His analysis, proving the entire absence of columbic acid, shows that the specimen he analyzed at least should be called tantalite, and not columbite, if the distinction between these two closely related species is to be maintained. It is hard to say where the line is to be drawn in such cases between two minerals, when the specific characters and the composition are so nearly the same. If the name is to be determined by the relative amounts of tantalic and columbic acids, what shall we call the mineral when these acids are present in nearly equal quantities? Preference was given in this case to the name columbite, for the reason that the specific gravity, as ascertained by the ordinary scales at command, was nearer 6 than 7. As Professor Schaeffer had only one fragment by post, while I had an abundance from many places, it may yet be found that columbic acid predominates in some of the specimens. I therefore use the name columbite or tantalite indifferently. With this explanation I proceed to give a few observations upon the occurrence of the mineral with the tin ore of the Black Hills.

There are two localities, especially, where the mineral is found in the same dike or vein as the cassiterite: 1, at the Etta mine; 2, at the Boh Ingersoll claim. At the Etta it occurs in close association with albite and feld-spar in crystals from one to four or five inches broad, and from one-quarter of an inch to three inches thick. It is not in contact with or mingled with the cassiterite, and each can be separately taken out. It is easily distinguished from tin-stone by its color and dark streak or powder, which is very different from the streak of cassiterite. It has never been mistaken for tin ore by any one connected with the Etta development, and the fragment sent by mail to Professor Schaeffer by the superintendent of the mine was not supposed to be tin ore. It is rarely found in the greisen rock with the tin ore, but a few small crystals have been seen near the outer margin of one of the irregular masses of the latter. It does not replace the tin ore, or interfere with its abundance to any appreciable extent, and it has not been looked upon as an impurity to be avoided. Even if it were present to a considerable amount it would not injure the tin in smelting. It does not alloy with tin, but carries a small percentage of tin which would probably be liberated in smelting. These remarks are rendered important and necessary by the fact that the announcement of the discovery of tantalite has been in some quarters abroad considered as showing that a mistake had been made respecting the occurrence of tin-stone, and that the supposed tin-stone had proved to be merely tantalite.

I found at the Ingersoll claim a very remarkable mass of columbite or tantalite, which must weigh over two thousand pounds. It is the only body of the mineral seen in that part of the vein, and is not in close association with the cassiterite. One charge of giant powder broke it into several fragments, three or four of which were each too heavy for a man to lift. The mineral is found also in a greisen-like aggregation of mica, which at this locality is not tin-bearing.

It has not yet been found in the tin ore veins of the Hill City district, except, perhaps, in one instance, and then not in contact with tin ore.

MONTANA COPPER COMPANY.—The smelter belonging to this company is running in full blast on ores from their own mines. The furnaces are all running the same as usual, and the regular force of men are still employed turning out copper-silver mat. At the mines work is being continued on the same old drifts. The company's Parrot mine keeps up its old reputation by producing the usual quantity of ore of exceptionally good quality.—*Butte Miner.*

ANGEL'S district is now the leading mining section of Calaveras county.

Mariposa's Gold Bonanza.

We learn since the departure of Colonel Holcombe, says the *Mariposa Gazette*, that a new feature in mining has commenced in the Diltz Gold Bonanza. The winter's wash upon the outcroppings has exposed a large body of rich ore and put new life in this mine. A new shaft has been started on the south end on the lode passing through the rich ore body to connect with the 300-foot tunnel. The ledge on the surface at this point is some 30 feet thick. It is believed that this new shaft will develop and expose to view the richest deposit of gold quartz ever found in the county. It has been ascertained by assay that the decomposed streak of red ochre and auriferous matter which lies on the foot wall, and on the west side for 1,700 feet in length, varying in width from two to ten feet, will pay by proper milling process from $5 to $100 per ton. Colonel Holcombe considers this remarkable streak of decomposed ore one of the best milling propositions in Mariposa county, as the entire deposit will mill free gold from $20 to $50 per ton, carrying also from two and a half to five per cent sulphurets. This new discovery is independent of the "mother lode," which is of itself from 2½ to 30 feet wide, and without assorting quite a number of tons was ground at the old Whitlock mill, which yielded from $20 to $40 a ton. The Diltz Bonanza is opened up for hand mortar by three inclined shafts, averaging one hundred feet in depth, and an open cut through the ledge from the south to the north end, a distance of 1,000 feet, and at a depth on the ledge from 10 to 15 feet. Although it was at an early period of mining, it is well remembered by many who still live and can testify to the fact that the original discoverers of this ledge and the gulches in the immediate vicinity picked up, pounded up in mortars and ground in arastras a sum, believed to be under estimated, exceeding $100,000.

A bit of history which perhaps was never written up or published, for at that early period, in 1850 and '51, there was no such thing as a newspaper published here, but there are still living in this neighborhood men who remember Sherlock, a miner, who first camped on the Agua Fria, in 1850. He was a great hunter, as well as a prospector for gold. He first found the famous gulch which occupies a portion of the Diltz Bonanza on the northerly end, and it was supposed at the time that Sherlock took out of that gulch, which bears his name to this day, not less than $100,000. Under the pretense of hunting, Sherlock, without even a companion, was sole proprietor of the gulch for several months before he was found out.

As soon as Sherlock's still-hunt became known the miners flocked in and every foot of the gulch was taken up, and soon made to yield its countless thousands of beautiful coarse gold. Sherlock did not remain long after he was discovered, hnt, with as much as a "mule could carry" of pure gold, as it was instanced in those days, he rolled out with his fortune to the United States, where he originally came from. Underneath the Diltz mining claim is what is well known as the "Loomis Gulch," from which it is well known hundreds of thousands of dollars worth of gold was taken, and in richness was only second to the Sherlock. The Diltz Bonanza is situated on an elevation overlooking both of these famous gulches, which no doubt were supplied by the nature of things from this mine.

These were the days, and for ten and fifteen years afterward, the rich gulches and placer diggings yielded up their enormous wealth; but now they are completly exhausted and all that is left to commemorate their existance is perhaps, according to geology and mineralogy, what was the Father, or, as they are called, the "Mother Lodes" of gold-bearing quartz veins that thread the mining sections which in their normal state abounded with rich gold-bearing placers and gulches. To any extent quartz mining is the only description of gold mining now prosecuted in Mariposa county.

Connected with the Diltz mining property is a mill site at Sherlock's Falls, 1,300 feet from the new shaft which has a water fall or pressure of 400 feet. Also a flowing spring on the north end of the mine and two other water rights that can be connected with the mine for steam purposes have been surveyed.

A new road is completed around the entire property and connects with the main wagon road leading to Mariposa, over which all machinery and supplies are transported for the Sherlock and Whitlock mining district.

The property is owned by Captain John S. Diltz who has secured it by a U. S. Patent. He has been working the mine on a limited scale for years, most of the time the work being of such a nature he has worked alone. He is a great worker, and has had almost a life-time experience at mining, and has been able to do the work of two or three ordinary men. Now that he has his title perfected to all his mining property and his plans for future operations upon the mine, he hopes soon to make some permanent arrangement to build a mill and carry on the work upon a more extensive scale, or to effect a sale of the entire property to a mining company.

The Shroeder Mine.

This remarkable mine, which can claim for itself as being a good hydraulic claim, is also possessed of a large body of quartz rock, which, as the dirt disappears under the force of the hydraulic, shows a large fine vein of auriferous quartz. We learn through Captain Diltz, who visited the mine this week, that it never looked so well and promising as it does at present. The water supply is limited. The Captain says he likes the appearance of the quartz rock better than any he has ever before seen in that mine.

Prospects at Calico.

The *Calico Print* says: The mining interests and other industrial pursuits of Calico and neighboring districts are at present in a most healthy condition. Although Calico is not externally quite so lively as it was a few months ago, yet the business done by established firms is good and constantly increasing. The hundreds of miners that had flocked into the camp to get the benefit of a "boom" have scattered to the four points of the compass in search of and to assist in booming some other locality. The number of chloriders in the camp has increased lately, but when the hot weather sets in chloriding will be generally suspended until fall. The principal mines in the camp are doing well, as will be seen by our weekly bullion reports taken from Wells, Fargo & Co.'s books, which, however, does not give the entire bullion output, for the ore from the Sue mine, milled at Waterman's, and the ore purchased from chloriders by the Daggett Ore Sampling Company and other parties, is not included, but enough is given to show that this region is productive of silver-bearing ore in considerable quantities. All the milling facilities are engaged to their utmost capacity, and undoubtedly in less than a year their capacity will be doubled, employing at least 100 stamps. Taking this great Mojave mineral-bearing district in its entirety, averaging its advantages and disadvantages, resources and deficiences, there cannot be found a better field for the investment of the millions of surplus capital rusting in the banks or tied up in small paying enterprises, than it offers. Railroads have made transportation comparatively cheap and the indefatigable prospector and pioneer has smoothed the way to such an extent that all the capitalist has to do is to take a palace car and soon he will be in the midst of mining properties that will pay him a handsome dividend when properly developed. A glorious future is in store for this region and each year will chronicle improvements at a compound ratio when compared with its predecessor.

Unskilled Assayers.

The Black Hills miners are getting wild on account of discoveries of tin ore. But there is really reason to believe that there is the largest deposit of tin ore in the bills of any place in the known world. There is very little gold, except in the immediate vicinity of Central City, about three miles above Deadwood, and nearly all of that is low grade. To the knowledge of the *Statesman* deep prospect holes were sunk on the banks of Bear creek, between seven and eight years ago. To look upon, the specimens were magnificent. They resembled the richest of silver ore, but no responsible assayist would give any return from them. The same phenomena existed on Little Rapid, in the vicinity of Ross's bar, and at Bear Butte. As a result, the mines were abandoned. Finally, some skilled assayers tried the ors for tin, and the result has been to give a new impetus to mining, with a promise of the most flattering results. In Colorado tellurium lay upon the dumps for years, and no one knew what to make of it; no ordinary process could be used to procure a color from it. A scientific Englishman happened along one day and amazed the miners by informing them that it was the richest gold ore in the world, and so it proved to be. The history of the discovery of diamonds in Brazil was similar. All these things go to show that the degree of knowledge possessed by the ordinary assayer is not of a sufficiently high standard. This class of men have been doing immense injury to miners through ignorance. Such ignorance in this case has set the Black Hills country seven years behind. They should not be allowed to pursue their profession unless examined and licensed the same as attorneys and physicians. For years in assaying for silver in the Black Hills, they have burned up—completely sublimated the tin. It is very evident that a higher grade of scientific knowledge should be required of the average assayer, and that it should be made a subject of legislative action.—*Boise Statesman.*

A DEADWOOD miner, skeptical as to the ability and honesty of the assayers in that camp, recently played on those gentlemen the old trick, with the usual results. He pulverized an old jug, mixed it with graphite, and took it to a Deadwood assayer. Another portion he gave to a Lead City assayer. The Deadwood authority reported 30 ounces of silver per ton as the result of his assay, and the Lead City expert gave $2 per ton in gold and no silver as the result of his investigations.

SMELTING and freight charges have been reduced by the Pueblo Smelting Company. Their rates from Kingman are now down to $17, to $23 for freight and treatment, according to the amount of lead in the ores.—*Mohave* (Arizona) *Miner.*

Engineering Notes.

United States Engineers Aiding British Enterprise.

The English correspondent of the *American Manufacturer* says: "It was Dr. Tweddle (who is utilizing his United States experience in laying a system of pipes in the Caucasus, in connection with the oil wells there), in conjunction with an English pipe firm who are making most of the pipes for the Caucasus, who showed the British Government by experiments at Aldershot that with United States engines water could be pumped at Suakim, a distance of which before British engineers had little idea.

The Great Power of the United States Engines

Has taken the British pump firms aback. So considerable is the duty required of the pumps which the Government has instructed Dr. Tweddle to get from Messrs. Worthington, that, according to some engineers, there is no probability whatever of such pumps being in stock here, and a leading pump-making firm (Messrs. Tangye) declare that "many months would be required to make them." A firm in Wolvertown, however—Joseph Evans & Sons—are bold to assert that their firm could have supplied the pumps in 30 days at a cost of £2,000, instead of the £4,000 charged by Messrs. Worthington.

The United States Pump to be Copied.

With United States pumps and English pipes, the first 50 miles of the line, the Government conclude, can be worked. The remainder of the distance is to be worked by pumps upon the United States model. In the House of Commons, recently, Mr. Brand, on behalf of the War Office, said: "Having got the pattern it is the intention of the War Office to employ English manufacturers in future."

United States Pumps and Future Demand.

If the design of these pumps is not secured by patent in Europe the example of the British Government will undoubtedly be followed over a wide area. Attention which this business has directed to United States engineering capabilities must sensibly strengthen the respect for them, which it is now almost "the thing" to openly acknowledge in European circles.

American Engineering Enterprise—Bold Words from a Prominent English Engineer.—Mr. Arthur Rigg read a paper on this subject at the last meeting of the Society of Engineers, based on his observations during a visit to Canada and the United States last autumn. We find room for the substance of the final paragraph of Mr. Rigg's paper, which will be read with high appreciation by American engineers. "The idea of putting up everything cheaply not only saps the foundations of permanent success, but depreciates the quality of manufactured articles, and destroys honest dealing. Thus, some of our goods are being driven out of foreign markets and replaced by the more honest American productions. The writer considers it the most genuine patriotism to tell his countrymen the truth without disguise, believing that we can never lead the van of progress if we shut our eyes to what goes on in the world around. America is the best country for us to copy from, as it is inhabited by our own people; and there is more for an engineer to learn there than from any other place in the world. They welcome every new invention, and the man of genius can hope for an early reward to his labor; while the engineer can freely obey the sound maxims—make first sure of those general principles you intend to apply, then trust them implicitly; and finally, never be afraid to carry them out."—*Engineering.*

A Pneumatic Tube Between London and Paris.—The plan to connect Paris and London with pneumatic tubes has been reported favorably by the French engineers and submitted to the Government. It is proposed that two pneumatic tubes be laid, following the line of the Northern Railroad from Paris to Calais, thence across the channel to Dover, following the line of the South-eastern Railroad to London. Letters could be thus transmitted between the two capitals in one hour. Wagonettes like those now used to transport telegrams from Paris are to be used, weighing 10 kg. and capable of carrying 5 kg. weight of mail matter. Twenty pneumatic trains are to be started every hour. The total cost is estimated to be $7,000,000. The total distance is 475 km.

Tapping Goose Lake.—A company has been organized for the purpose of constructing a canal to tap Goose lake and conduct its waters into Pitt river, thence over the sage brush lands in that valley to irrigate the vast body of lands that are lying waste in that region. It is expected to make 60,000 acres of desert land productive and fertile.

Reversing Locomotive Engines.—English practical science demonstrates that reversing an engine on a railroad train has scarcely a perceptible effect in checking it; the main reliance must be upon the brakes. In one case, where the engine was reversed a quarter of a mile from the station, the train passed the station at the rate of 20 miles an hour.

Useful Information.

Nickel Kitchen Utensils.—It is well known that acids have a more or less decided solvent action on nickel-plating; and inasmuch as the use of nickel-plated kitchen utensils are becoming quite common, it is a matter of importance to determine what would be the effect on the human organism of the nickel which may find its way into the food prepared in such vessels. An investigation, having this purpose in view, has recently been made by F. Geerkens, who affirms that as much as ½ gramme (about 7½ grains) of nickel may be taken into the stomach and repeated for a long time without producing any noticeably bad effects. As the quantity of nickel which by any probable means could find its way into food in the course of its preparation in nickel vessels, would be only a fractional part of this quantity, there would seem to be no grounds for uneasiness in the use of nickeled kitchen utensils, especially where the same precautions are used as in the case of copper utensils—thoroughly cleansing, and avoiding the storing of food in them.

Paper Counterpanes and Pillow Shams.—A company in New Jersey is making paper counterpanes and pillow-shams. Number one manilla paper is used, two large sheets being held together by small twine at intervals of three or four inches, gummed so as to stick the sheets together where the twine lies. The twine strengthens the paper. The margin of the counterpane has a hem, in which is more of the twine to keep it from tearing. Beautiful designs are printed on the upper surface of the counterpane and pillow-shams, which make a very neat appearance. When they become wrinkled they can be made smooth by hot flatirons. They retail at seventy-five cents a set. The counterpane can be left on the bed when it is occupied, if so desired, and in cold weather it will be found a very neat and warm article of bed clothing, since the paper will prevent the escape of heat about as well as a woolen blanket.

What an Educated Man Ought to Know.—According to Ruskin, an educated man ought to know these things: First, where he is—that is to say, what sort of a world he has got into, how large it is, what kind of creatures live in it, and how, what is it made of, and what may be made of it? Secondly, where is he going—that is to say, what chance or reports are there of any other world beside this, and what seems to be the nature of that other world? Thirdly, what he had best do in the circumstances—that is to say, what kind of faculties he possesses, what are the present state and wants of mankind, what is his place in society, and what are the readiest means in his power of attaining happiness and diffusing it? The man who knows these things, and who has his will so subdued in the learning of them that he is willing to do what he knows he ought, is an educated man; and the man who knows them not is uneducated, though he could talk all the tongues of Babel.

Tinning Small Articles.—Dissolve as much zinc scraps in muriatic acid as it will take up, let it settle, then decant the clear, and it is ready for use. Next prepare a suitable iron vessel, set it over the fire, put your tin therein, and melt it, and put as much mutton or beef tallow as will cover the tin about one-fourth inch thick. This prevents the oxidation of the metal; but be very careful that the tallow does not catch fire. The iron, or any other metal to be tinned, must be well cleaned, either with scraping, filing, polishing with sand, or immersed in diluted vitriol. Proceed to wet the articles in the zinc solution, then carefully immerse them in the tallow and melted tin; in a very short time they will become perfectly tinned, when they may be taken out.

To Measure the Candle Power of a Light.—Measurement of the candle power of a light is accomplished by comparing the shadow cast by a rod in the light of a standard candle with the shadow cast by the light to be tested. By moving the latter toward or away from the rod a point will be reached at which the shadow cast by both lights will be of the same intensity. The intensities of the two lights are directly proportional to the squares of their distances from the shadows, *i. e.*, suppose the light to be tested is three times the distance of the candle, its illuminating power is nine times as great.

Artificial Sponge, made of cotton, rendered absorbent, and treated with antiseptics, has been invented in England, at Birmingham. A piece of the size of a walnut has absorbed water until it reached the size of a cocoanut. It is so cheap that it need not be used but once, so that sponge infection can be readily avoided.

Fat from Cork.—Suberine, the characteristic component of cork, is a true fat, saponifiable by alkalies and oxidizable by nitric acid, which converts it into a mixture of aulheric acid and ceric acid. It is composed of the mixed glycerides of phellonic and stearic acids.

Pine Wool.—True pine or forest wool—the "Wald wolle" of Germany—according to Mr. Thomas Greenish, is manufactured from needle-like leaves of one or more species of pine previously exhausted of the volatile oil and other matters by a process of boiling.

Useful Cement.—The following cement is said to be perfectly efficacious. It is so simple that it is worth trying: Take some old, soft cheese and heat it well in a mortar, washing it thoroughly at the same time with hot water. After the soluble matter is all washed away, a white mass of nearly pure caseine will remain. This should be squeezed in a cloth to express moisture, dried, reduced to powder, and preserved in a closely stoppered bottle. When required for use, a small quantity should be ground with a very little water, to make a thick, viscid paste, which must be used at once, as it hardens very quickly. Mix only as much as may be needed, for after it once hardens it will not dissolve. It is not affected by heat or water.

Use Glue Hot.—The hotter the glue is when applied, the greater will be its binding power in holding surfaces together; therefore, in all large and long joints glue should be applied at once after boiling. Glue loses much of its strength by frequently re-melting, and that which is freshly made is preferable to that which is re-boiled. In melting ordinary glue in the double vessel containing water, it is an excellent plan to add salt to the water in the outer vessel. It will not boil then until heated considerably above its ordinary boiling point; in consequence, the heat is retained longer, and when the water boils the glue will be found to be evenly and thoroughly melted.

A New Use for the Sand-blast.—Monuments and statues cast from refined zinc are given a sparkling appearance by directing a sand-blast under steam pressure upon them, so that the sand cuts the surface but does not adhere to it. A thin film of oxide is thus formed which stands atmospheric exposure admirably; yet the film is so thin that it scarcely admits of the nicest measurement.

A New Alloy.—*La Nature* gives the formula of a new alloy, which is especially adapted to many important uses in the arts. It melts at the low temperature of 160° Fahrenheit, or considerably below that at which the magical spoons of long ago melted in a cup of tea. Its composition is: bismuth, 48; cadmium, 13; lead, 19; tin, 20. The alloy will withstand severe pressure.

Alder Bark Tannin.—Alder bark contains tannin in quantity variously estimated at from 3 to 20 per cent. Lamasse says that this tannin is a methyl-tannin, and belongs to the same series as that of the oak. With ferrous acetate it gives a reddish blue precipitate; with ferrous sulphate an olive green. It is precipitated with solution of gum, but is not affected by tartar emetic.

Sandpapering Machines are among the greatest labor-saving machines which can be introduced into a wood-working shop, especially when furniture, brackets, etc., are manufactured. This will save from 3 to 10 men's work, and do it in a manner far superior to the way it is ordinarily done by hand sandpapering.

Filtered Water.—Water filtered through porous, unglazed porcelain is absolutely free from microbia. With a single such vessel, 0.20 meter long by 0.25 meter in diameter, C. Chamberland obtained about 20 liters a day of physiologically pure water.

A Mercurial Varnish.—A varnish composed of 120 parts of mercury, 10 parts tin, 20 parts green vitriol, 120 parts water, and 15 parts hydrochloric acid of 1.2 specific gravity, furnishes a good coating for iron exposed to the wet.

White Spots on Furniture.—To remove white spots from varnished furniture try this: Rub with a sandpaper gently; then with a soft piece of cotton cloth rub on some shellac varnish thinned with turpentine.

Foreigners in Paris.—The foreign population of Paris is comparatively very small for a great city. Out of a population of 2,239,000, all but 225,000 are native born.

Good Health.

Health in Workshops.

J. B. Lakeman, an English inspector under the Factory Act, recently lectured on this subject, in the course of which he said: To enumerate the various trades which were injurious to health, if unaided by proper ventilation, would include metallic-dust producing, mineral-dust producing, vegetable-dust producing and animal-dust producing occupations. Needle-makers, grinders, file-makers and molders suffered in lungs to the extent of 50 per cent, flint-cutters to the extent of 80 per cent, grindstone-makers to the extent of 36 per cent, weavers 25 per cent (the fiber of cotton being most injurious), brush-makers to the extent of 49 per cent, hat-makers to the extent of 15 per cent (the dust from cheap hats being more injurious than that from the fine felt), and chimney-sweeps and coal-miners were not included in these rates of mortality.

Speaking of the want of ventilation and sanitation in factories, he said that in this category they should exclude textile mills, not generally, but particularly, as he could point out factories where these things were properly looked after. Coming to such trades as printers, book-binders, bakers, dyers, and artificial flower-makers, he mentioned that these industries, in many cases, were not conducted under proper lines of ventilation.

He referred to the great importance of pure air in keeping workers in health. The conditions of work in closely-confined, over-crowded, and ill-ventilated workshops were something unbearable, and the consequences were fatal to robust life. The law said that a factory should be in a cleanly state, free from effluvia arising from drains or otherwise, should not be over-crowded while work was carried on, so far as to be injurious to health, and should be ventilated in such a manner as to render harmless, as far as practicable, all the gases, dust, vapors, or impurities generated in manufacture.

Pure Water.—Absolutely pure water is not to be obtained in nature, but by distillation. Pure water has a more powerful effect on lead pipes than that we ordinarily use. This is very easily proved. Get a bottle, three parts full of distilled water from a druggist, and put into it some bright, clean shavings from a bar of lead. In another bottle of hard water place similar shavings. Leave both bottles uncorked, but where no dust can enter, for a few weeks, then shake and examine. The distilled water will be more or less turbid from lead, while the other will be hardly altered. Rain water acts on lead about the same as distilled water, and should never be stored in lead-lined cisterns, or cisterns with lead pipes.—*Herald of Health.*

As in the textile trades so in other trades, many employers of labor did their best to keep their workplaces in a healthy state, but there were thousands of handicrafts-men who had passed their lives in workshops, and become masters in a small way, occupying places most suitable to their means. This meant frequently that in a small room there would be half a dozen people at work, and in these cases unsanitation abounded. Old dwelling-houses were now often turned into workshops, with every room full of women working under a state of things that ought not to exist. In conclusion he implored employers to consider the terms on which they employed free labor, and whether it was free labor at all that condemned a people to a lingering death.

Cost of Sickness.—Statistics reveal a somewhat startling tale of the cost of illness to a nation, and of the loss of valuable time, opportunity and money which even a small modicum of ill health entails. Thus it is calculated that the ordinary sickness of England and Wales annually costs the country 20,000,000 weeks' work—that is, as much work as 20,000,000 of people in good health would accomplish in a week. Put in another way, this amount may be stated as equaling one-fortieth part of the work done yearly by the whole population between 16 and 65 years of age. If any arguments were required to show that good health means pecuniary gain, the above fact would afford such proof.

Old Women's Remedies.—A writer in the St. Louis *Medical Journal* advises young practitioners never to make fun of an old woman's remedy. He will not only give offence, but may miss a valuable aid in his practice. The writer adds: "In 1830, while practicing in Madison county, Ill., I was indueed, by the representations of an old woman, to make the trial, in dysentery and diarrhœa, of tablespoonful-doses of pure cider vinegar, with the addition of sufficient salt to be noticeable, and it acted so charmingly that I have never used anything else."

The Brain Renewed Six Times a Year.—The novel computation has been made by a German histologist that the human brain is composed of no less than 300,000,000 nerve cells, each an independent body, organism and microscopic brain so far as concerns its vital relations. As each nerve cell is estimated to live about 60 days, 5,000,000 must die every day, about 200,000 every hour, and nearly 3,500 every minute. The dying cells are replaced by an equal number of their progeny, and once in every 60 days a man's brain is entirely renewed.

How Germs Get into the Lungs.—In the ordinarily healthy lungs, perhaps even in persons who have a consumptive heredity, the germ which causes the breakdown of the lung may not be able to make an impression; but if the physical integrity is destroyed by poor food, or any debilitating influence, or by a cold, then the germ is able to get in its work, and to multiply and produce its kind and to fill the lungs with tubercles.—*Dr. Curtis.*

Cocoaine.—Cocoaine may be used with perfect safety for performing slight surgical operations, such as opening a boil or carbuncle, cutting or lancing the gums, for operations on the eye, etc. A boil may be cut after applying it on the surface with no more pain than is felt in cutting the finger nail. It is a very valuable discovery.

Wet Feet.—To live on a soil which keeps the feet damp and cold is a frequent cause of consumption and rheumatism. Good draining is the only remedy for such a soil. In three towns in England, Eli, Rugby and Salisbury, consumption has declined from 40 to 50 per cent since the land has been thoroughly drained.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—Amador *Ledger*, April 18: The new double engine and hoisting works are now in successful operation. Notices have been posted calling for bids for sinking 100 feet deeper, with the intention of opening up another level. The mill is running steadily, and everything about the mine looks as encouraging as ever. The addition of ten more stamps to the mill is expected to be accomplished this summer, as the ore body in sight is considered sufficient to justify such increase.

MISCELLANEOUS.—The North California Mining Company have let another contract to run their tunnel 200 feet further. The price is $2.95 per foot—50 cents per foot below the last contract—contractors to furnish candles, powder and fuse. The tunnel is now in 400 feet, and it is expected that the ledge will be tapped before the next 200 feet is completed. The big tunnel at Middle Bar is now in over 2,200 feet. Fresh developments are reported at the St. Julian. A larger deposit of black gold-bearing metal than any recently encountered was struck early this week. The mill has been supplied with a new wheel, and also a double-car which doubles the crushing capacity of the stamp.

HARDENBURGH.—Amador *Sentinel*, April 14: J. R. Hardenburgh and ex-Sheriff Adams of San Francisco came up last week and took a look at the Hardenburgh mine. Mr. Hardenburgh states that in all probability work on the mine will be shortly commenced. Some work is being done upon the Moore mine property. Very good rock is now being taken from the old Dunning and Faull mine by the new prospectors.

Calaveras.

GOOD LUCK HYDRAULIC.—Calaveras *Chronicle*, April 16: Work in the Good Luck hydraulic at Chili Junction, owned by Hughes and Jones, is progressing favorably. The company has been to a great deal of expense, having had to dig a ditch three and a half miles long in order to convey water to their mine. The claim comprises 80 acres of good ground, and the bank ranges from five to forty feet in hight. The company is using 100 inches of water under a pressure of 75 feet. No clean-up has been made in the mine as yet, but there is not the least doubt but that the owners will reap a handsome reward for their trouble and expense.

MURPHYS.—The outlook for a prosperous summer is encouraging. In the Oro Plata shaft sunk to intercept the tunnel being run to tap the larger ore body of low-grade, free-milling ore, quartz of exceeding richness has been encountered, and bids fair to be extensive. The strike is important, and in consequence the company is elated. The mills will start up in about three weeks, when good results are expected. In time the entire works will be run up to their full capacity.

Inyo.

RUSS MINING DISTRICT—THE WHITE HILL.—Inyo *Register*, April 14: [This is we mine the last issue unwittingly designated as the "White Star,") Alexander, Kehoe & Barnes, of the White Hill mine, have about 30 tons of silver-lead ore ready for shipment; they will increase this amount some 10 or 12 tons this week. The ledge is looking strong, and gets larger as it is opened. Hedge & Eldred are working the Pine Tree mine, an extension of the above, and have a fair showing. There is no doubt but this will open out as large as the White Hill.

EASTER SUNDAY.—Pat Keyes has located the south-east extension of the White Hill, and calls it the Easter Sunday. The croppings indicate as good a mine as there is on the hill.

THE UNION.—Reynolds & Treglown are taking ore out of the old Union. They have about 20 tons ready for shipment, and which will probably go to San Francisco, since the boys are still awaiting pay for ores sold to the Elna furnace last October. [This is, or was, we believe, the first mine located in Russ district. This was in 1861, and by two different parties at the same time. They joined forces and hence called it the Union, and the district after the leader of one of the parties, Col. Russ. The district covers the western face of the Inyos, between Lone Pine and Independence.]

BROWN MONSTER.—Thomas & Bell are still taking out ore from this mine, and expect to have 20 tons ready for shipment by the 1st of May, which is as soon as the new Selby Works at Oakland will be ready for operations.

SANTA RITA.—It is reported that this mine bids fair to again, ere long, loom up as prominently as it did years ago. It is looking well.

MINING GOSSIP.—A private note from Independence states that Isaac Harris and Wm. Hedge had just returned from the Reilly mill, Argus range, where, in the interest of the firm of Harris & Rhine, they made a clean-up of the pans, and presumably, with very satisfactory results. Also, that L. C. Gray, who spent so many years on the Kearsarge mine, had, according to rumor, secured foreign capital, and would shortly be here to resume operations on the mine.

WAUCOBA.—Some months ago Fuller & Erwin took out a couple ot tons of ore from a new find over in Waucoba, and had it worked at the Elna furnace. It proved not only quite rich in silver, but also the best smelting ore ever tried in that furnace. They, or at least one of them, have been and are still driving away upon it ever since, and were their reduction works at hand, would undoubtedly make it pay first-rate. As it is, they can pack the ore across the mountain and make it pay very well.

MILL TALK.—It has been the talk for some time past that a small mill is to be built at Mammoth this summer. A few men have been digging away there ever since the grand exodus of three years ago, and at times have found considerable bodies of rich ore. This fact with the apparent assurance of more to be had right along, will, it is said, well justify the erection of a small mill, and it is quite probable it will be done. The big Mammoth mill yet stands there, but is a total wreck. It will be remembered that it was reported sold for removal to Bodie or thereabouts, but winter coming on, nothing was done in the way of its removal. It is considered nearly a certainty that a 10-stamp mill will soon be built to work the ores of the Casey and other mines across the river here. A recent survey shows that by means of a ditch from a neighboring creek, ample water-power can be had right at the mine. As the mine produces large quantities of ore that will pay cheap milling, saying nothing of other qualities of higher grade, no doubt but the mill will be built there. But, from what parties tell us, a mill at Bishop station could have the ore of a large number of good gold leads, many of them known to be rich, some small, others of fair size, and all quite close at hand, saying nothing of such as the Casey, Poleta and others, still within easy reach. We believe a mill at that point would do a good business. Arastras are running on ore from some of these mines, particularly in Redding canyon, and others are proposed. Four men are constantly employed on the Casey mine, and are taking out ore in paying quantities.

WHITE HILL.—Inyo *Independent*, April 18: County Clerk Hunter was up to the White Hill district last Wednesday. He says it is the best poor man's mine he has seen in many a day. There was then thirty-five tons of ore on the dump, and more being added every day. Like every one else Mr. Hunter regrets that such fine ore should have to be sent to San Francisco for smelting. The ruin of the furnace at Elna has left Owens Valley without any facility for smelting ore, and now that the supply of good ore appears to be better assured than ever before, the want of such facility is all the more keenly felt. Parties have lately tried to get the use of the furnace at Swansea, but there appears to be a bad case of dog in the manger there. From the Jim mine at Darwin, Gorman and McKenzie are taking out a good deal of fine ore; it goes 87 ounces per ton in silver, and 40 per cent lead. The same parties have recently bought the Champion mine, adjoining the Jim. The Maxim mill is about ready to be started up. Mr. Stansfield has several hundred tons of ore at the mill, and plenty more available; he has persevered in the face of many difficulties, and fully deserves a rich success.

Mariposa.

TO START UP.—Mariposa *Herald*, April 17: F. C. Leavitt goes to Cathey's Valley to-morrow to start up the Maggie Johnson mine and mill. He expects to thoroughly develop the property and will work all ore taken out. He also intends to do custom work at the mill when not crushing his own rock. There is another mine, the name of which we did not learn, that he intends to prospect. What the mining interests of Mariposa county need now is for a few mines to commence shipping bullion out of the county. That kind of argument convinces capitalists quicker than anything else of the value of a mining community. There are mines at work in the county that probably ship bullion regularly, but we have no means of ascertaining the amount in Mariposa. Work was recently commenced by some Fresno parties on the old Green Mountain Copper mine near the residence of Willis Brewer in Lewis district. Four men are at work driving a tunnel. Several gentlemen who were in town this week from the north side of the river report that the recent strike in the Red Cloud mine is a bonanza. The Banderite is also showing up to a good advantage. The specimens of gold that are constantly being brought into town from Sherlock's and Colorado would indicate that there are mines in that vicinity fabulously rich. The lucky owners seem to have no desire to sell and manage to keep their bullion shipments a secret.

Nevada.

NORTH STAR MINE.—Grass Valley *Union*, April 17: A force of 65 tributers are now at work in North Star mine, and the number is to be increased soon. About 100 tons of tribute rock have been raised to the surface since underground work has been resumed. Now that the water in the mine has been pumped out, the steam pump, which was used for lowering the water, will be replaced by a stationary pump. The mine does not make much water at the bottom, and the pump will not have heavy work to perform. The main incline is soon to be sunk for another level. The different levels, since the mine has been relieved of water, are found in general good condition.

A RICH MINE.—Nevada *Transcript*, April 17: The Delphi mine is situated about three miles from Columbia Hill, on what is known as Grizzly Hill. It is owned by R. McMurray, Judge Searls and others. Their new 8-stamp mill was completed about 10 days ago, and by good judges it is said to be a model affair, perfect in all its parts. Chris. Mallon and George Lord, of this city, have charge of running the mill night and day. Everything on the surface having been got in tip-top shape, work was continued on the ledge, and that ledge is proving to be one of the most valuable ever discovered in this county. The rich chute of rock they are now working is from 5 to 12 feet thick, and all of it will average $32 per ton in free gold, besides the sulphurets which will yield $100 per ton. They are now crushing about 18 tons per day, and out of this they are averaging a ton of sulphurets every 24 hours. Their expenses, all told, will not average over $40 per day, and thus it will be seen that it is not only a rich mine, but a very cheap one to work. The owners expect to have a clean profit of $10,000 for the first month's run, and the probabilities are very strong that it will exceed that amount. The mine is a new one, and one that has been passed by a thousand times, not being considered of any value. Nevada county contains a network of quartz ledges, and after the present generation has passed away it will yet be a booming mining camp, for we have ledges here, after the proper work has been done on them, to maintain 10 times the population our county now possesses. This new and valuable find should give a new impetus to the section where the Delphi is located, and will in a measure make up for the loss the people have suffered by the stoppage of hydraulic mining.

BELMONT CON.—*Mountain Messenger*, April 18: Belmont Con. Co., Poker Flat, have the frame up for their mill. A good trail has been put in for packing machinery to the mill. Seventy tons of rock are in the dump and 100 tons in sight, the gold from which is valued at $17.30 an ounce at the U. S. Mint. In two or three weeks the mill (Taylor & Forbes) will be started, when more ore will be taken out.

Placer.

SUCKER FLAT MINE.—*Argus*, April 16: The new management of the Sucker Flat mine are enlarging the tunnel, in order that they may be the better able to work the mine to advantage. They propose to employ three horses in hauling the cars instead of one, as at present. The enlargement is made by taking up the bottom of the tunnel. They are also making other improvements, among them being the building of a new dump-house. About 15 men are employed at the mine now, but it is expected that 40 or 50 will shortly be put on. The mine is reported to be paying handsomely.

Plumas.

CROMBERG NOTES.—Plumas *National*, April 18: The Ward mine is running with a full force, Gen. Evans as superintendent. Mr. Ward has gone below. Mr. Jackson is running along all right, working both mines, the one here and in Mohawk. The river is very low, and there will be several bars worked this season. Considerable mining will be done on the river this year.

San Bernardino.

WATERMAN MILL.—*Calico Print*, April 18: Col. Burch has just returned from Waterman, where he has had two carloads of ore milled. He reports the returns as more than satisfactory both as to weight and assays. The Waterman mill is earning for itself an excellent reputation among chloriders because of the fair and square returns that they receive from their ore crushed at the mill.

Shasta.

GOLD AND SILVER.—Shasta Co. *Democrat*, April 15: Last week from three tons of ore from the Florida mine Dan O'Neal cleaned up 40 ounces of gold. Last week ten tons of average ore from the Silver King were shipped to San Francisco for a working test. It is reported on good authority that the Iron Mountain mine will resume work and shipments this month. J. D. Doblin of Muletown has bonded his placer and quartz mine near that place to parties in San Francisco for $15,000. Some New River prospectors abandoned their proposed trip at this point and struck out for the new gold fields on Squaw creek. Mr. Jno. Southerland, superintendent of the Niagara Mill and Mining Company, was in town Saturday. He says the new 10-stamp mill is running well. From 15 to 20 miners are prospecting in the mountains near Muletown. We are told several good prospects were struck in that district last week. Further sinking in the Pioneer mine on Oregon gulch has been deferred for the present. The shaft is down 50 feet. At this depth the water is too much to handle with a common windlass. Dan O'Neal has purchased the interest of his partner, Abe Ebersol, held in the Ebersol and Red Seal quartz mines on Star gulch; also his interest in the cannon-ball mill, and will have it running in about ten days. Having entire control of the property now Dan is preparing to do better work on the mines than ever. Mr. Wm. York, of Vallejo, has bonded the Red Rock mine on Flat creek for one year. He will put a good force of men at work opening up the mine and expects to put up a mill early next fall. The Red Rock is a continuation of the May Queen and Black Jack. Both of these claims prospect well, carry fine "gouges" that pan out rich in free gold and the vein confined in fine walls of porphyry and slate. The sulphurets from these three claims assay from $150 to $250 per ton, of which the ore produces a good percentage. These claims are undoubtedly good property for any one having the means to properly work and develop them. Quite a number of prospectors have recently made locations on Dog creek, from 3 to 5 miles west of Delta, and are at work sinking shafts and running tunnels to open them. Sanders & Whitlow have about completed their concentrator, and we have every reason to believe it will prove a very profitable investment for them. The croppings from two or three of these claims assay several ounces in silver, as well as from $20 to $40 in gold. Mr. E. W. Stoufer, assayer, who was up there last week putting up the arastra for Sanders and Whitlow, speaks well of the camp, and thinks several good mines will in time be shown up on the creek.

Sierra.

PLACERS.—Cor Sierra county *Tribune*, April 17: Your correspondent has been busily hunting up items in relation to the mining industry of this vicinity (Sierra City), and has learned that the Lewis brothers are bard at work on their placer claim in Ladies canyon. Dan Thompson will commence operations on his placer claim this week. The wagon road leading to the Young America quartz mine will be completed in about two weeks, weather permitting. I learn that there have been negotiations going on either bond or sale for the Mountain mine; this mine is owned by Capt. H. Warner; he has a U. S. patent on his property. It is said to be one of the best locations in this district, there being a number of well-defined gold-bearing veins in the mine, varying from size to two feet in width. A large number of tons of rock has been worked by the arastra process and will pay from $12 to $14 per ton. The veins being large, great quantities can be mined at a very trifling expense. There is also a good water right attached to the property. There are quite a number of persons out on the hill prospecting quartz. It is said some are meeting with very flattering results. If the operations go on that are talked of in the different mines there will be quite an influx to our population this summer.

Tehama.

TO RESUME.—Shasta county *Democrat*, April 16: J. R. Holt, of Red Bluff, interested in the Kauffman placer mine on Mill creek in the north-eastern part of Tehama county, informs us that the company is preparing to resume operations on that mine this spring.

Trinity.

PAYING WELL:—Trinity *Journal*, April 18: The two Blakemore arastras on Eastman Gulch are being run by Messrs. Jas. H. Fisher and R. Killins, and the rock is paying well, the last clean-up being about $3,200—the rock averaging from $40 to $50 per ton. The rock crushed is from the Blakemore mine.

TRIAL TEST.—A delayed casting for C. W. Huson's new quartz-crusher was received this week and has gone forward to the North Star mine on East Fork. The mill will be started up to-day and next week it will be known how much work it can do and how well it can do it.

NEW QUARTZ DISCOVERIES.—New ledges are reported as found during the past week on Eastman Gulch, between the Hickey and Blakemore mines, and another on Spring Gulch, a tributary of Indian creek. Good prospects have been obtained in both instances.

W. F. ARNOLD, of French Gulch, was in town this week, and reports mines and mills of that flourishing district in active operation, doing good work and as a rule paying well.

DISTANCES.—The Eureka *Times-Telephone* gives the following table of distances from San Francisco to the New River mines by way of Eureka, with the assurance that it is as nearly correct as possible by the present traveled route: "San Francisco to Eureka, 240 miles; Eureka to Arcata wharf, 10 miles; Arcata wharf to North Fork, 10 miles; North Fork to Berry's, 15 miles; Berry's to Willow Creek, 20 miles; Willow Creek to Thomas's, 24 miles; Thomas's to New River, 30 miles." A little addition shows that the total distance from Eureka to the mines is 109 miles.

Tuolumne.

GOLD.—Tuolumne *Independent*: Capt. Griffin, of Columbia, has a very rich claim in his residence lot. The streak makes up from the old Tiger claim, crosses the road and runs under his house. He has taken out a large amount of gold, and it is estimated that he will take from $20,000 to $30,000 out of the claim. On Saturday he cleaned up about $900. In three pans of dirt he got $80, in one of them $27.75. Parties who have visited the claim say it is the richest thing they ever saw, as the gold can be picked out of the solid gravel bank. Mr. James Tulloch is adding 10 stamps to a fine 10-stamp mill, at Angels, Calaveras county, which he erected there about three months ago. He also has a contract to put up an 8-stamp mill at the same place. The quartz interest appears to be lively in that section. A few days since two young men of Sonora took out a $500-pocket near town. As they do not desire their names or the locality of their mine given, their wishes in this report are complied with. But there is no mistake about the gold, for it was exhibited to friends.

RICH GRAVEL IN COLUMBIA.—*Union Democrat*, April 16: Captain John Griffin has struck 49 gravel in a claim which he is piping in Columbia, and is taking out the yellow stuff at a surprising rate. All those who have seen the ground are agreed that the claim will produce many thousand dollars. As it is, the Captain is taking out $50 a day. The ground lies under an old road, and was left unexplored by the early miners. It prospects anywhere from $4 to $25 to the pan, mostly in fine gold. The extent and extraordinary richness of the ground is proof positive that Captain Griffin has a considerable bonanza in his claim.]

NEVADA.

Washoe District.

HALE AND NORCROSS—The good ore development of Thursday has inspired renewed confidence in the ultimate success of this company in showing a paying mine at the present profound depths attained. On the 2,900 level cross-cut No. 4 west, which was at first intended to run diagonally in a north-westerly direction across the vein, has been turned more to the westward, so as to cut directly across the vein. On the 3,000 level cross-cut No. 2 has been advanced west about 60 feet from the main lateral drift north, and the good ore which was struck at the floor of the cross-cut now occupies the whole face. The easterly pitch or dip of the vein is more perpendicular than on the level above, therefore it was not reached by this cross-cut quite as soon as expected. Moreover, it is not precisely known as yet whether this is really the main vein or an offshoot or bulge to the eastward. Yet, if the vein widens from the level above in going down, this may easily be the eastern selvage of it. Five or six feet of pretty good ore have been passed into, and some rich stringers and bunches of black sulphuret ore encountered, assaying up in the hundreds. Some vein porphyry as well as low-grade ore help to make up the composition of the vein, but the whole mass will probably average $50 per ton or more under the stamps. Meanwhile this cross-cut is being steadily advanced, and will develop the ore vein or bonanza possibilities and probabilities at that depth. Very little water has been encountered thus far, and owing to the nature of the ground no trouble is anticipated from that source. It is proposed to carry this cross-cut through to the west wall.

CON. CALIFORNIA AND VIRGINIA.—On the 1,750 level the south-west drift, being run toward the old Con. Virginia ground, continues making a good rate of advancement, and the ore stopes on this level are still looking and yielding as well as usual, keeping the Morgan mill steadily supplied. The ore gives an average assay of a little over $20 to the ton. The ore stopes between the 1,200 and the 1,500 levels are also turning out as well as usual, being worked under the Jones' lease. The ore gives an average assay of a little over $30 to the ton, and is reduced at the Eureka mill.

CHOLLAR.—On the 3,000 level cross-cut No. 1 west has been advanced to about 85 feet in toward the ore vein, from the main south lateral drift, and is running in quartz of the most favorable character, containing bunches and stringers of ore, indicating the near proximity of the desired vein. The face of this cross-cut is near to the Hale and Norcross line, and will eventually cross it unless turned more to the left.

BALTIMORE.—A small vein of good-paying ore, a foot or so in width, extending from the 200 level down to the 400, which has worked and followed more or less in years past, is now being systematically and successfully worked by tributers. This they store away in the drifts until they get a sufficient accumulation for hoisting to advantage and milling.

KENTUCK.—The old upper levels keep the Rock Point mill on Carson river steadily pounding away as usual.

BELCHER.—Nothing new in the mine beyond the extraction of low-grade ore from the old workings through the Crown Point.

OVERMAN.—The winze to connect the old Lambert tunnel with the Petaluma-street tunnel, has nearly reached down to the desired connection. When this is made the known ore resources of the

226 level will be advanced into and further developed.

ALTA.—Good work is done in the explorations above the 950 level after the occasional small bunches of good pay ore found there, which are being extracted and reserved for milling.

YELLOW JACKET.—The old upper levels continue their excellent yield of low-grade ore—from the 1,150 level up to the 200, or sagebrush level. Bunches of pretty good ore are found about the 400 level.

WOODVILLE.—Nothing new to note except a reported improvement in the stopes between the 300 and 400 levels.

GOULD AND CURRY.—On the 1,000 level the main lateral drift north toward the Savage has progressed about 350 feet from the shaft, and is making good advancement in favorable working material.

CROWN POINT.—The yield of low-grade ore from the old working levels, from the 1,700 up, still continues, with an occasional streak of better quality.

Columbus District.

MOUNT DIABLO.—*True Fissure*, April 18: The west drift on the sixth level has advanced 11 ft. during the week, while the north cross-cut from this drift is in 67 ft. The west drift on the fifth level shows a little $70 ore. The winze from this drift is down 35 feet, and shows a small streak of $30 ore. The stope above this drift is giving some $50 ore. The intermediate between the fourth and fifth levels and above this stope is giving considerable $70 ore. The intermediate between the same levels and near winze No. 2 is not looking quite so well. Some ore of fair grade is being taken from between the third and fourth levels near winze No. 5. Some $70 ore is being taken from the west drift on the third level. The east intermediate stope between the second and third levels shows a small streak of $200 ore. The west intermediate between same levels is giving some $50 ore. A small amount of fair-grade ore is being extracted from the east drift on the second level. The intermediates between the first and second levels are giving some ore of good grade. A bullion shipment of $14,475.27 was made on April 14th.

Cortez District.

PROSPEROUS.—*Eureka Sentinel*, April 17: From a miner just in from Cortez we learn that that camp is booming in a quiet way. He claims to have seen more bodies of high-grade ore on Bullion Hill than he ever saw in the same space of ground elsewhere in the State of Nevada. He says the reason he left was because all the country of value thereabouts is located, and that there is no show to get in any. It was the first camp he ever struck where the miners did not talk of selling out. The principal mine is that worked by Gillam Bros. and Tex. They are stoping down ore from a 5-foot body that our informant took samples from, the whole face of which, he claims, averages $1,500 a ton. The old pioneers of Cortez say it is the finest body of ore of such richness ever struck in the camp. It is a contact vein between granite and stratified lime. Billy Earls is working an adjoining claim, which is rapidly turning out ore averaging $800 a ton. It is another contact vein. Hank Smith has a 16-inch ledge in the Aurora mine at a depth of 250 feet. He has stripped it for a distance of 40 feet in length and 10 feet high, and he now has a winze started down from the tunnel level. The ore produced so far assays $1,450 a ton. These are the deepest workings on the hill. S. E. Ducommon, of the Silver Fleece, has ore in two places, which he is sacking for shipment to Salt Lake. W. R. Lewis has opened three bodies of fine looking ore in the Maid Queen. De Vere & Bowdoin are driving a tunnel along the ledge of the Sweepstake mine, and are extracting a fine quality of sulphurets and antimonial ore.

Taylor District.

LOOKING UP.—Cor. Southern Utah *Times*, April 14: As was predicted, nearly all the mines in Taylor are in full blast, and are turning out high-grade ore and plenty of it. Bullion shipments will be in order for some time to come. The Argus group of mines is looking splendidly, and the company undoubtedly will, at an early day, be more than compensated for the prospecting work they have done. The large bodies of ore the company have thus far uncovered is of a superior quality. Our two mills are hammering away and are turning out bullion at a lively rate. Over 100 men are working in the mines, and millmen, wood-choppers, teamsters and others are busy, and all branches of business are lively. Another correspondent says: "The mines are looking well and the outlook indicates that we will have a lively summer; but I think there has been too much puffing in the newspapers, as there are a great many men coming in here in search of work and are disappointed, as there is not employment for all; hence, there are many idle men here. Fifty-five men are now employed at the Argus and about the same number in the Monitor mine. Both mills are in operation down on the creek, and the probabilities are that they will pound out crude silver until winter freezes them up again.

Tuscurora District.

NORTH BELLE ISLE.—Tuscorora *Times-Review*, April 17: North drift, 150-foot level has been extended 11 feet; total distance, 152 feet.

INDEPENDENCE.—Drift south, 400-foot level, has been extended a total distance of 1,170 feet, and at this point an upraise will be started to connect with No. 1 shaft. No. 1 cross-cut from this drift has been extended 70 feet, No. 2 cross-cut 9½ feet, and cross-cut west 4 feet.

BELLE ISLE.—North drift from No. 1 cross-cut east, 400-foot level, has been advanced 5 feet. Fair progress has been made in drift north from west cross-cut, 250-foot level. No. 2 upraise north on the 250-foot level, has been carried up 5 feet, and shows some good ore.

NAVAJO.—Cross-cuts and drifts on the 650-foot level have been extended the past week 61 feet. No. 1 winze, 350-foot level, has been sunk a total distance of 196 feet. Fair progress has been made in the drift south and cross-cut east, 350-foot level. South drift, east vein, 150-foot level, extended 5 feet. No. 2 cross-cut east, same level, has been extended a total distance of 207 feet.

Willow Creek District.

THE WILD DEER MINE.—*Silver State*, April 18: H. H. McColley shipped yesterday a bar of bullion valued at $1,155 from the Wild Deer mine, at Willow Creek, to the Carson Mint. The Wild Deer is pretty thoroughly prospected by shafts and tunnels, and is said by old miners to be very valuable property.

ARIZONA.

MOHAVE MINES.—*Miner*, April 12: Messrs. Maxson and Jackman are working on the Primerosa mine in Todd Basin, and have a nice little pile of ore on the dump. This is one of the many good claims owned by Capt. Layne. James Smith is opening up the N. G. claim, an extension of the Gibraltar, near Layne's springs, and has developed a body of good ore. Rees M. Jones and James Daggett have leased the Queen Bee from C. E. Sherman and have sunk a 30-foot shaft. Messrs. Sample and Jamieson are working on the old Gibraltar claim and doing well as may be seen from the fact that a recent shipment of five tons netted them the nice little sum of $584. Henry P. Ewing showed us the returns of his last carload of ore from the Altata mine received last Friday. The ore was shipped to the Argo smelting works and sampled as follows, per ton: gold, 1-12 ounce silver 91½ ounces, copper 17½ per cent. Price paid per ton at the works, $88.67. Total for the carload $1,059.78. Price charged for treatment, $15 per ton. Freight from Kingman to Argo, $20.50 per ton.

STERLING.—Prescott *Courier*, April 10: Messrs. Cox & Craigue are now paying strict attention to the development of the Sterling mine, which is at present a very promising gold property. Their Hoefler mill will soon be at the Sterling.

BIG BUG.—A gentleman who came here from Big Bug district a couple of days ago tells us the mill was about ready to run. One hundred or more tons of gold-bearing quartz were on the dump. Professor Church will, we hear, start and run the mill for the owners. Lawler Bros. are drifting in one of their Santa Maria copper mines. The talk on the street is that Mr. E. M. Clark will soon be here from the East, with means to sink 100 feet more on the Chicago mine, Groom creek. Those who are working placer mines are rejoicing on account of the late rain, which assures them plenty of water for some time to come.

TURKEY CREEK.—Mr. Theodore L. Chase, superintendent of mills and mines in Turkey creek district, came to town yesterday after a long absence in the hills. He is feeling well, too, on account of the arrival of three concentrating machines, which, with one of his 10-stamp mills, will be taking the gold out of ore from the Wonder mine in a very short time. Mr. Chase came by Mulvenon & Roach's mine, and there feasted his eyes upon a great deal of rich silver ore. He gives it as his opinion that the time for profitable workings of our mines is at hand. J. L. Fisher yesterday received nearly $2,000 in gold from the Lynx creek hydraulic claims.

COLORADO.

PREPARATIONS.—San Miguel *Journal*, April 16: The weather continues in an unsettled condition, and there is apparently less real work going on in the mines than in the dead of winter. The fine, warm weather in March promised an early spring, and, had it continued, a number of mines would now be working full forces and shipping ore daily. Preparations for the resumption of active work were being made, but the storm of last week unsettled all plans, and at present but little can be done. A great many of the leading mines have been developing all winter, and the amount of ore that is exposed and that can be rapidly taken out is something wonderful. All the mills, too, are preparing for a busy season, and one or two new ones will pe erected.

IN MARSHALL BASIN.—Work has been resumed on the Leslie mill, and it is expected that it will be in running order early in the season. A force of men began work last week on the Argentine, taking out the water preparatory for an extensive working of the mine. It is expected that members of the company will be here next month to examine the mine and decide upon the character of machinery necessary for its profitable working. Work on the Sheridan, Flora, J. W., Jr., and on other properties goes steadily on with pleasing results.

BEAR CREEK.—This locality will be the scene of greater activity this year than ever before witnessed. The mines of the Golden Group Company will be in charge of a Mr. Thompson. The company have ample means at hand for a vigorous season's work, and it is their intention to thoroughly develop their properties. They have some very promising prospects, and we predict that they will be listed as paying mines before fall. Mr. E. L. Davis, superintendent of the Nellie Company, has leased the Golden Group mill for the season, and will begin active operations as soon as the trail to the Nellie is opened.

TURKEY CREEK.—At the Gold King mill preparations for starting the mill are all completed, and it was expected to start up this week. At the Turkey Creek mine a small force has been employed all winter in taking out ore. The force will soon be increased and the mill started up. O. D. Brumbaugh, who is working the Dixie under lease, has out a large lot of good ore. He has 300 sacks all ready for shipment. The Dixie is the mine of Turkey Creek.

GENERAL NOTES.—Charlie Byfield came down from the Magpie, on Bill creek, and reports the mine looking excellent. He is now working in 15 inches of solid mineral. In the lower level of the San Bernard mine, at Trout Lake, a large body of mineral was struck last week. Mr. Gamboni, the owner, is considerably elated over the new strike.

IDAHO.

BONANZA.—Cor. Idaho *Keystone*, April 11: It is too early in the season to give you any items of importance in regard to our new mines, but there are several locations on which developments have been going forward all through the past winter, that bid fair to become rich ore-producing mines. On Horse Hill, just west of Bonanza, Mr. Wm. Shehan is working three mines, the Legington, Roanoke and Afterthought. He has well-defined veins of ore which prospect well. The Dorchester on the same hill, owned and being worked by Mr. McNamara, is on a line with the Charles Dickens and Montana mines, and is supposed to be on the same vein. There has been no ore crushed from these mines, but there probably will be this summer. The new vein that was discovered in the Custer mine some time ago, which lies between the Pfeiffer and Tonkin's tunnels, is about seventeen feet wide, and grows wider and stronger as work progresses; and under the skillful management of those having the mine and mill in charge, the bullion produced this year will exceed anything heretofore recorded of this famous property. The Custer Co. have leased the Badger mine, and will, when the proper time arrives, put a force of men to work taking out the ore, which is known to be rich. There is considerable ore already on the dump.

ATLANTIC.—Idaho *Statesman*, April 17: Mr. O. J. Fleck, of Atlanta, called on us yesterday. He reports four feet of snow on the mountain between Atlanta and Rocky Bar. All the mills in Atlanta are shut down, the last one to shut down was Mr. Petill's, the Atlanta mill, about four weeks ago. Times, of course, are very dull now and will not revive until supplies can be got in, which will be six weeks or more. The stage has not got into Rocky Bar, but goes within six miles and the rest of the way on horseback.

A 30-STAMP MILL FOR CROY GULCH.—Wood River *Times*, April 17: Col. Doniphan, of the Big Camas mine, arrived to-day. He states that the mill will be shipped from Denver next Saturday, and will be taken out to the mine as soon as it arrives. The mill is of 10 stamps, but the building and engine will be of sufficient capacity for 30 stamps. The additional 20 stamps will be put on as soon as the mill demonstrates that the ledge will "pay."

THE GOLD BELT.—As stated in this paper, there will be at least two mills erected at or near the Rock and Camp creek divide this summer—one by Col. Doniphan's company, and another by that in which Senator Jones and a San Francisco millionaire are interested. These mills will simply test the productiveness and value of the ledge, and if the result is satisfactory, the Rock creek country will boom. Gold mines have always been preferred to all others, because the metal is easily extracted, and the ore veins more regular and cheaper to work than all others. Nor do people look for as rich ore in gold-bearing veins as in others. Sam Jones, superintendent of the Crown Point mine, and brother of Senator Jones, is expected here within a week to look the gold belt over. If his report is favorable, much capital will find its way here in the next 12 months.

THE CAMAS NO. 2 MILL.—Wood River *Times*, April 17: The machinery of the mill contracted for, last fall, for the Camas No. 2 mine, at the head of Rock and Camp creeks, has been completed for some time in Denver, and held to await advices from Hailey concerning the condition of the roads between this place and the mine; but it will be all shipped from Denver by the 15th inst., so as to reach here in time to be taken out to the mine by the 1st of May. Some of the machinery has already arrived at the Hailey depot, but the bulk of it will come as above stated. This will be a gold mill, of 20 stamps, with all the latest improvements, and will cost, when ready to start, about $10,000. The foundry work weighs over 40,000 pounds, and the Iron Works of Hailey and Denver have taken the contract to build the whole mill, which is to be finished by the 1st of June. The building of this mill will undoubtedly be the cause of the opening up of the enormous gold-bearing Big Camas vein.

NEWS.—George W. Faylor arrived to-day with his family from California. While in San Francisco Mr. Faylor succeeded in organizing a company, of which ex-Congressman Davis and United States Senator Jones are members, to exploit a group of mines at Rock creek.

MONTANA.

STEMPLE DISTRICT.—Helena *Independent*, April 14th: We have the pleasure of announcing the important developments that have occurred within the past few days, besides being able to furnish matters of interest concerning some of the old bonanzas in the Stemple district, about two and a-half miles from Marysville. Rich strikes have been made upon the Empire, Homestake and "M. L." lodes, owned by Hickey and Cotter, James M. Ryan, Mike Lane and M. Lynch. On the east end of the Empire lode a tunnel 100 feet in length has been run. At the end of the tunnel a cross-cut has been run, and a solid mass of gold and silver bearing ore has been struck of a width of 22 feet from wall to wall. The ore assays from $80 to $700 per ton, and from 28 to 32 ounces in silver. Four hundred feet west of the tunnel is a shaft 40 feet deep, at the bottom of which is run a drift and then a cross-cut in which 10 feet of ore has been struck, averaging from $80 to $100 per ton in gold and 28 ounces in silver. Eight hundred feet still further west is a 65-foot shaft in which a 32-foot drift has been run with a cross-cut at the end showing a 10-foot body of ore which runs from $100 to $150 in gold, and from 23 to 30 ounces in silver. On the "M. L.," a 400-foot fraction, a shaft 80 feet deep has been sunk and cross-cuts run. The west cross-cut shows an ore body of ten feet, the lowest average assay being $80 in gold and 35 ounces in silver. On the Homestake lode there are three openings about 200 feet apart, and each shows that the ledge is from eight to twelve feet wide. Although no great amount of development has been made, the ore shows well. The old Whippoorwill mill, owned by Hickey & Cotter, is undergoing repairs, and baving settlers and pans put in, and in about six weeks will be in good running order and prepared to work the ores of the above lodes.

THE HELENA DISTRICT.—From a gentleman who yesterday visited this new district we were given items as follows: The Helena's lode shaft is now down 82 feet, and shows three feet of solid ore, richer than ever, has been found in the claim. The Dies Faustus lode, owned by J. P. Porter, Thomas Goff and others, has a 30-foot shaft, and the ore in the bottom is about two and a-half feet wide and looks well. Secretary Tooker has a number of men at work on the Blue Jacket and is greatly encouraged over his prospects. The Syndicate, Christmas Gift and Grass Valley lodes are all looking well.

NEW MEXICO.

ORGAN.—Rio Grande *Republican*, April 18: Ross and Bennett delivered nearly three tons of galena ore carrying about $200 to the ton. It came from Silver Gem. The smelter closed down on Wednesday morning, and it is doubtful if it ever fires up again until they commence operations in Las Cruces. It throws a good many men out of employment. Mr. J. Sandon is putting in a small concentrator at the Bennett mine for the purpose of working the dump, and after he finishes that dump, he will move to others and go from one to another through the camp. We sincerely hope he will make a success of it. Should he do so it would be a great help and would help the miners here to dispose of their low-grade ores to a good advantage.

OLD MAN.—Silver City *Enterprise*, April 17: A strike of great importance was made on the Old Man mine on Tuesday. Five feet of high-grade ore was uncovered that is actually lousy with horn silver. Over 100 sacks of ore was taken out in a very short time that would have paid the running expenses of the mine some time. Two other strikes have been made at other points during the week, and the mine is said to present a better showing of high-grade ore than at any time for months.

GEORGETOWN.—The most important strike ever made in the Georgetown mines was encountered in the workings of the McGregor mine last week. A body of remarkably rich chloride ore, 28 feet in width, was uncovered by men who were drifting for an air outlet in the mine. After being thoroughly prospected Alex. McGregor took two samples from the face of the ore body. One of these, which he considered the best, returned $668 in silver, and the other, which was the poorest, returned a value of $368 per ton. The owners are very jubilant over the discovery.

OREGON.

RYE VALLEY PLACERS.—Bedrock *Democrat*, April 16: The Rye Valley Placer Company, located at Rye Valley, Baker county, Or., have started in work on their vast tract of placer ground this spring on a very extensive scale and with the finest prospects of a rich return for their energy displayed. For those of our readers who are not aware of whom compose this company, we give the following list of officers: Isaac B. Rich, president; H. E. Chamberlin, vice-president; John W. Drew, secretary and treasurer. Directors—Isaac B. Rich, Boston, Mass.; H. E. Chamberlin and Edward A. Jenks, Concord, N. H.; John W. Drew, General Manager. The capital stock of the company is $125,000, which has all been paidin. The company owns about 700 acres of mineral land, and nearly 400 acres of timber land, making nearly 1,100 acres in all. Also 20 miles of ditches, 10 reservoirs, etc. The company is entirely free of debt, is in complete running order, now employing 22 men, and running over 400 inches of water with five claims working full ten hours each. Rye Valley is about 100 miles from this city, and besides the very extensive claims of the Rye Valley company, other properties are being worked with great success. This section is one of the richest in our county, in placers, and of late some very valuable quartz discoveries have been made that promise of considerable value in the near future.

BURNT RIVER GOLD MINES.—Baker City *Tribune*, April 17: The excitement and interest taken in the great gold belt along Burnt river, in this county, between Weatherby's station and Huntington, is rapidly increasing, very much owing to the push and energy of the Union Pacific railroad system. Already one claim, which promises to be a valuable mine, has been sold the past week for a very large consideration. The claim sold is an extension of the Grover Cleveland mine, which, from all accounts, is a veritable bonanza. The Cleveland mine is owned by Dr. E. P. Howard, R. S. Anderson and others, and is said to have 1,000 tons of free milling gold ore in sight, which averages $80 to the ton. Railroad men and Eastern capitalists are already engaged in looking after this rich mineral belt, and we candidly expect to hear of large sales being made there in the near future. Experts from the East have already examined some of this great mineral belt.

UTAH.

HORN SILVER.—Southern Utah *Times*, April 14: The winze running from the 800 to the 900 has been completed. A station is being cut out at the bottom of the shaft, which is now finished to a depth of 900 ft. The air is so bad, on account of the shutting off of the draft by the cave in the old workings, that it will be impossible to work any number of men to advantage before the proper connections are made. It is safe to say that there will be no ore shipped from the mine for several months. During the first part of next week contractors will begin to run the drift from the bottom of the shaft to the ledge, a distance of about 250 ft. Work will be prosecuted at both ends of the drift, and should, barring another accident, be completed in from six weeks to two months. There will be no opportunity to increase the force of miners until this work is done.

COPPER GULCH.—Work is being steadily prosecuted on the Comet mine by the Morrison Brothers. The drift at the bottom of the new 40-foot shaft is now 70 feet. There are several tons of very fine ore on the dump. The drift is being run on ore all the way from the shaft. The ore body has been improving and a large showing is made in the face of the drift.

REVIEW.—Salt Lake *Tribune*, April 7: The week has been rather stormy, but not at all harsh, the showers being seasonable. The movements of the metals have been light. The shipments out from this city for the week ending Saturday, the 11th inst., inclusive, were 56 cars and 1,436,375 pounds. The receipts of bullion and ore in this city for the week ending April 15th, inclusive, were: Bullion, $58,070.38; ore, $6,771.47; a total of $64,841.85. The week previous the receipts were $127,729.46, of which $113,429.46 was bullion, and $14,300 ore. The Ontario shipped during the week thirty-six bars of bullion, $24,610.38, making its total output for the present year $508,264.61. The Horn Silver is yet dormant; no shipments of bullion are reported, though some have been made. The Christy was the only shipper from the sandstone district this week. It sent two bars of silver, $3,220. The product of the Hanauer smelter for the week was eight cars of bullion, $20,900.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office. No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

☞SUPERIOR TO BLACK OR JUDSON POWDER.☜

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

218 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO, CAL.

GOLD QUARTZ and PLACER MINERS

Silver Plated

AMALGAMATING PLATES,

For Saving Gold

First Premium Awarded at Mechanics' Fair, 1884.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates gold separated for low percentage of result.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

A Glance Over the Mining Field.

Portland, Oregon, is to have a silver-lead smelter.

All the Horn Silver bullion that was on hand has been shipped out of Utah, and ore shipments from the mine have not yet been resumed. It is said the smelters are to be closed down for six months at least.

The great bulk of mattes produced in Butte, Montana, contain such a small proportion of arsenic that a most excellent metal can be obtained from them by the ordinary processes of matte concentration and refining. A considerable proportion of the product of the district is shipped to England for treatment; but it is rather for commercial reasons, and in some cases because of the better prices received abroad for argentiferous material, than from any necessity of seeking foreign aid to produce a copper of satisfactory grade.

The shipment of copper cement from Spenceville, Nevada county, California, for the month of March, amounted to 160,000 pounds, the largest shipment since the mine was opened.

The mill and mines at Marietta, near Aurora, in Esmeralda county, and abandoned on account of the refractory nature of the ores found in that region, have been leased by some parties who have succeeded after long experimenting in finding a process of working the rich ore at a profit. The first shipment of eight bars of bullion, valued at $5,000, was made last week, the result of one month's run. It is said that the copper taken from the ore in leaching is so pure and plentiful that it pays the entire expense of working it.

Placer mining promises to become one of the permanent and lucrative industries of Globe district, Arizona. All the gulches within a radius of several miles have been tested and gold in paying quantities found. Considerable time has been lost experimenting with various methods of sluicing, but now that the hydraulic system has been tried and proven so successful, it is likely to be introduced on claims where sufficient water can be obtained.

The new reduction works of the Paradise Valley mill are producing about 2,000 pounds of concentrates daily. The first shipment of 15,000 pounds of concentrates has been made.

P. W. Campbell, of Smartsville, a well-known hydraulic miner, who was fined $500 by Judge Keiser, of the Superior Court, of Yuba county, for alleged contempt of the order of the court in working his mine after being enjoined, and who refused to pay the fine, and who has been arrested several times for such refusal, was again arrested last week at Wheatland, and was taken to Marysville.

The Downieville *Messenger* tells the story of a miner near that place who has been digging a ditch "wrong end up," the end discharging the water being higher than the end at which the water is received. His engineering was at fault. This is not the first time the same thing has happened in California. A like piece of ditch construction was made in Placer county many years ago, and after several miles of the ditch was completed it was found that the water would not run to where it was intended it should go.

The court has ordered a new trial in the famous Albion-Richmond trial on the ground that the verdict was against evidence and obtained by fraud. The Albion Mining Company sued the Richmond for $500,000 for ore said to have been extracted by the latter from Albion ground. A verdict in favor of the Albion for $13,250 was given at the spring term of the court last year.

The old Raymond & Ely plant, including mines and complete machinery, at Pioche, formerly owned by the Raymond & Ely Mining Company, is offered for sale. Also one 30-stamp mill, and one 20-stamp mill at Bullionville. The machinery turned out an immense lot of bullion in the prime days of the mines of that section.

All work in the Eberhart and Aurora tunnel has been suspended for an indefinite period. A number of old and trusted employes who have worked for the company for the past twelve or fourteen years were among those discharged.

It is reported that work will soon be resumed in the May Lundy mill, and that the Mono Hydraulic diggings are putting in new pipes and getting ready to turn on the water.

About a month ago the managers of the St. Helena Mining Co. at Las Delicias, Sonora, stole a bar of gold bullion worth $13,000. The thief was never captured. A few days ago some men went to two saloon-keepers in an Arizona town and said they knew the man who had the bar and that he would take $1,000 for it. The saloon men went to the mountain indicated, found the man and bought the bar for $1,000 cash. They had it chopped up and sent to various points for sale; but what they had bought was found to be worthless brass or some other metal. The general verdict is, "it served them right."

Mining Share Market.

The mining share market still keeps in an active condition, although prices have not been so well sustained this week as last. A number of prominent mining men have been visiting the Comstock, attracted there by the developments. The *Enterprise* says that all who have visited the two lower levels of the Hale and Norcross agree in pronouncing the very promising development at that point of great value and importance to the whole lode and country, as giving strong and very tangible reasons for believing that a good-paying mine will be found there, with the possibility of even an old-time bonanza. The cross-cut on the 3,000 level is not sufficiently advanced to prove and tangibly demonstrate that the good ore vein found on the 2,900 level widens and grows richer as it descends to that point; but, taken together with all other well-known conditions, the assurance is almost beyond a doubt that the ore body will be found richer and more extensive on the 3,000 level than above. Mr. Mackay unhesitatingly pronounces it the best prospect that has been found in the Comstock for the last six years.

Meanwhile, the management is doing all that men can do, under the circumstances, to develop the new find in the most advantageous manner. They do not claim it to be a genuine bonanza as yet, but hope to develop a good paying mine in due course of time.

Bullion Shipments.

Moulton, April 13, $30,604; 18, $19,200; Lexington, 14, $20,688; Silver Bow, 12, $12,680; Alice, 18, $29,880; Pittsburg Cons (Lewis Dist., Nev.), $1,000; Hanauer, 14, $2,500; Ontario, 14, $24,610; Christy, 14, $1,680; Vienna, 14, $2,060; Minnie Moore, 14, $1,150; Hanauer, 14, $5,000; Queen of the Hills, 15, $2,200; Hanauer, 16, $2,600; Christy, 16, $1,540; Minnie Moore, 16, $1,140; Ontario, 17, $17,356; Stormont, 17, $3,250; Hanauer, 17, $2,500; Queen of the Hills, 17, $1,200; Vienna, 18, $92,400; Hanauer, 18, $4,800; Minnie Moore, 18, $1,100; Christy, 19, $1,690. The banks of Salt Lake City report the receipts for the week ending April 15th, inclusive, of $58,070.38 in bullion and $6,771.47 in ore; an aggregate of $64,841.85.

SIZE OF BEARINGS.—Mill shafting ought to have hearings four shaft diameters in length. It will save oil, bearing, metal and power to have them this long. They should be lubricated (notably, if they are too short), uniformly and continuosly, and not allowed to squeak before cooling and oiling.

A METAL that expands in cooling is made of nine parts lead, two parts antimony, and one part bismuth. This alloy can be advantageously used to fill small holes and defects in iron castings

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 262 Market St., S. F.

FOR WEEK ENDING APRIL 14, 1885.

315,695.—CANDLESTICK—A. Hermann, Drain, Or.

315,700.—TYPE-WRITING MACHINE—E. S. Belden, S. F.

315,701.—TYPE-WRITING MACHINE—E. S. Belden, S. F.

315,702.—TYPE-WRITING MACHINE—E. S. Belden, S. F.

315,782.—SEED PLANTER—R. L. Taylor, Santa Barbara, Cal.

315,950.—LIFE-PRESERVER—C. Leduc, S. F.

315,651.—TRAVELING THRASHER—W. Norton, Orland, Cal.

315,824.—ORE CONCENTRATOR—C. W. Patten, S. F.

315,825.—ORE-GRINDING MILL—A. B. Paul, S. F.

315,992.—CABLE RAILWAY—Henry Root, S. F.

315,853.—INSERTIBLE SAW-TOOTH—N. W. Spaulding S. F.

315,566.—HINGE JOINT—Menzo Spring, S. F.

315,583.—ORE-CRUSHER—W. E. Wild, S. F.

12,118.—TRADE-MARK—Cal. Fig Syrup Co., S. F.

12,130.—TRADE-MARK—Paraffine Paint Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BURGLAR ALARM.—Ira G. Leek, S. F., No. 315,152. Dated April 7, 1885. This is an alarm device to be used on doors for the purpose of announcing the opening of the door on the entrance of a person going into the room, and it consists of a gong or bell with a disk supporting a hammer and operating mechanism having a central opening through the two for the introduction of the shank of the door-knob, the gong or disk occupying the place of and forming a rosette, which is secured to the inside of the door between the door and the knob.

LIFE-PRESERVER.—Constant Leduc, S. F., No. 315,950. Dated April 14, 1885. This life-preserver is of that class in which the buoyant property is supplied by suitably arranged bunches of the dried stems or stalks of palms, rushes, reeds, etc., but preferably of the tule grass which grows so abundantly in California, and the use of which in this connection is patented by the same inventor. The present invention consists in the novel formation and arrangement of the bunches and their connection to form a complete life-preserver, without the use of any external covering sack or skin of canvas or other material, such as is usually employed.

HYDRAULIC ENGINE.—Samuel N. Knight, Sutter Creek, Amador Co. No. 314,689. Dated March 31, 1885. This is an engine by which pumps or other reciprocating apparatus may be driven. It consists in a combination of devices, and is "a hydraulic engine, having a main cylinder, piston and piston-rod, transversely placed valve-chambers at the ends of the cylinder containing valves, and supplemental cylinders and pistons, valve stems having rollers attached, and valves by which water is admitted to and exhausted from these cylinders, in combination with an arm on the piston and inclined plates adapted to move the valve stems of the supplemental cylinder to their own motion."

DRYING APPARATUS.—Orlando B. Hardy, S. F. Assignor to Giant Powder Co. No. 315,141. Dated April 7, 1885. This invention relates to certain improvements in that class of drying apparatus in which a series of endless belts are arranged to travel one below another and alternately in opposite direction, so that the material falls from one belt to the next below and is carried backward and forward as it descends, until it reaches the discharge next below it. It consists in certain improvements in driving the belts independently of each other, or a means for keeping them extended transversely, and in details of construction. In the machines hitherto constructed with a series of belts one above another, the driving rollers are located at the same end of the machine, and are driven by a single ordinary belt. The result is great friction and a heavy strain on the driving belt as well as upon the carrying belts, which are moved by driving rollers at their ends. To avoid these results Mr. Hardy first divides the entire motive power into ten parts, so as to apply it at the proper end of each belt, and again divides the power at each end in order to apply it as nearly direct as practicable, and apply it to the rollers at their discharge end so that the driving rollers shall draw directly on the upper and loaded half of the belts, and finally use chain belts to avoid excessive friction and consequent strain and wear. The apparatus is specially designed for use in powder manufactories.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

CUT SPIKES.—All sizes, $3.00

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Material.

Lime, per barrel, $1.50@$1.60. Plaster, $2.75–3.00. Eastern Plaster, $3.00–3.25. Rosendale Cement, $2.10–2.25. Portland Cement, $3.50–3.75. Fire Brick, per 1,000, $30 @ $40, according to brand; hard, $9.00; red, $8.00; oft, $7.00@7.50; face, $25.00.

Mining and Scientific Books.

PUBLISHED OR ISSUED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF OPES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

M. S. PRIME—Alameda County.
MRS. OZIER—California.
W. H. H. HUSSEY—Contra Costa County.
F. W. SMITH, New Mexico and Arizona.
W. B. TURNER, California.
R. E. BUSH—Shasta, Tehama and Trinity Cos.
M. C. BAKER—Napa and Yolo Cos.

MOTION OF THE SUN.—It has been hitherto supposed that the solar system is moving toward the constellation Hercules; but the investigations of Prof. Plummer, of Oxford, lead him to believe that the point toward which we are moving is nearer the constellation Lyra than has been generally suspected. As it is not likely that the sun describes a straight line in space, it becomes important to collect all possible information which may help us to ascertain the exact form of its orbit.—*Nature.*

NOTICE

Is hereby given that a meeting of the stockholders of the Lord of Lorn Gold and Silver Mining Company (a corporation) will be held on the 11th day of May, A. D. 1885, at one o'clock P. M., at the office of said corporation, in room No. 6, in building No. 318 Pine street, in the City and County of San Francisco, California, for the purpose and with the object: First, of increasing the capital stock of said corporation, so that the whole amount or par value thereof shall be $10,800,000, divided into 108,000 shares of the par value of $100 each; and, Second, to repeal the by-laws of said corporation, or any part thereof, and to amend the by-laws, or to adopt new by-laws therefor, as said meeting may determine. By order of the Board of Directors and Trustees, and of the President. March 7, 1885. JAS. T. MCDOUGALL, President.
R. N. VAN BRUNT, Secretary.

New Book on Assaying Gold & Silver Ores.

BY C. H. AARON.

For Practical Workers.—$1

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

N. B.—This is Part I of three volumes on assaying by the same author. To be followed by Part II—Gold and Silver; Part III—Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.

W. E. CHAMBERLAIN, Ja T. A. ROBINSON.

PACIFIC Business College, 320 POST ST. SAN FRANCISCO.

Returned to new building, former location, 320 Post street, where students have all the advantages of elegant halls, new furniture, first-class facilities, and a full corps of experienced teachers.

LIFE SCHOLARSHIPS.....$75.

Ladies admitted into all departments. Day and Evening Sessions during the entire year.

Call, or send for CIRCULAR to
CHAMBERLAIN & ROBINSON, Prop's.

BEAUDRY'S
Upright Power Hammer.

ENTIRELY NEW DESIGN.

SIMPLE, PRACTICAL, LOW-PRICED.

SIMPLE, PRACTICAL, LOW-PRICED.

"Gives a perfectly square blow."
"Does not vibrate."
"Requires no helper."
"Repairs are little or nothing, and there are no springs to crystalize."
"Can be run cheaply and with very little power."
"The anvil is entirely separate from the frame."
"Always ready for use."
"Open space between the dies."
"Will give one blow or more as required, light or heavy."
"Does not chill the work."
"The Strokes can be changed easily and quickly."
"It is the least complicated and most efficient power hammer in the world."

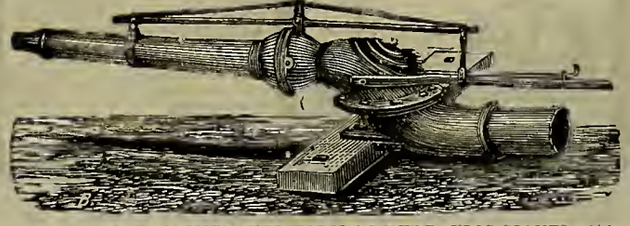
—FOR SALE BY—

MORRIS & VARNEY,
24 Fremont Street, SAN FRANCISCO.

The California Perforating Screen Co.
All kinds of Quartz Screens, slot or round holes; zinc, copper and brass for
Flour and Other Mills.

Quartz Mill Screens a Specialty.

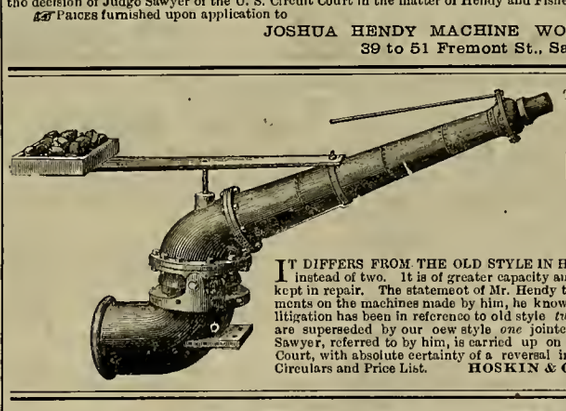
IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All other styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

PAICES furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.



THE CUT REPRESENTS OUR
IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List. HOSKIN & CO., Marysville, Cal.

H. N. COOK,
Manufacturer of
LEATHER BELTING and LACING.
OAK-TANNED, SHORT LAP BELTING.

SAN FRANCISCO TOOL COMPANY, - - 11 Stevenson Street, S. F.

California Wool.

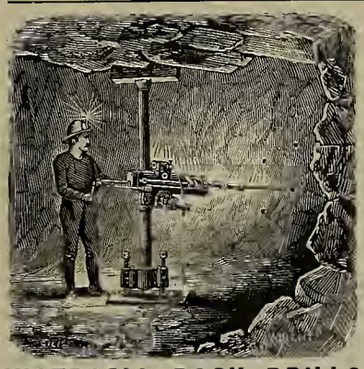
Sorting and Scouring Before Shipping.

Wool growing in California is of too much importance to be neglected, and every point should be watched and discussed that would be beneficial to those engaged in it. California produces about 40,000,000 pounds of wool annually. The woolen mills of this State consume about 5,000,000 pounds, thus leaving some 35,000,000 pounds to be transported to the Eastern States for consumption. The freight on this surplus is two cents per pound, amounting to $700,000. The estimate shrinkage of California wools, taking spring and fall clip is nearly 70 per cent. After scouring 100 pounds, there remains only 30 pounds of clean wool, showing clearly that there are 22,750,000 pounds of dirt and grease shipped at two cents per pound, amounting to $455,000. This wool is all bought with a margin in favor of the purchaser, sufficient to cover all their expenses; besides, the buyer allows himself an extravagant additional margin for shrinkage, and it must not be forgotten that all these drawbacks come from the pocket of the grower, directly and indirectly. This important matter in the wool trade, has as yet, had little consideration. There is, however, a remedy for this immense loss, and the sooner it is adopted the better and more remunerative the business will be to the wool grower. Every pound of wool should be sorted and scoured before shipment to the East, and until such is the case our California wools will not bring nearly their actual value to the grower, either here or in the Eastern market. Much of our fall wool clip is unsightly, containing dust, and because of this every opportunity is taken to condemn it; at the same time, much of it is good, soundstapled wool, and if properly sorted and scoured, would be very desirable for manufacturers, and, in this State, would bring its actual value.

Buyers take advantage of the fact that much of the wool in our market contains burrs. This is no longer a great drawback, except from the shrinkage it occasions. After the wool is sorted and scoured, the burry parts are run through a burring machine, which cleans it from all vegetable matters, leaving the wool as good and as valuable as the rest. All scoured wools find a readier sale; at the same time all the imaginary drawbacks that the wool growers are suffering from are obviated. There is much wool in our market at present, selling at 9, 10 and 11 cents per pound, that will not shrink over 60 per cent. If it cost 10 cents per pound, shrinking 60 per cent, when scoured and ready for the manufacturer to use it would cost 25 cents and freight to the East 2½ cents, the rate for scoured wool laid it down in Boston would be 27½ cents per pound. The same scoured wool is worth in the Eastern market from 37½ to 40 cents per pound, and is in demand. If the above means were adopted, there is no doubt but the grower would realize at least from 12 to 15 per cent more for his wool than by the present mode of disposing of it.—*S. F. Journal of Commerce.*

WOOL SCOURING is becoming quite a business in San Francisco. There are now seven establishments engaged in this industry. The high freight on wool to Boston makes it decidedly profitable to scour it here, thus saving a freight on about 70 per cent of waste matter. There is quite a discrimination, however, in freights, according to the value of the wool transported. Freights by railroad are 1½c ₩ lb on wool costing 12c ₩ lb or under; 1¾c ₩ lb up to 18c ₩ lb and 2c ₩ lb over 18c ₩ lb; but the quantity of the latter is not very large. By ship to New York, around Cape Horn, it is 1c ₩ lb. The freight on scoured wool is 3c ₩ lb. As a general thing growers are disinclined to have wool scoured for their own account to any extent, but if they continue to hold it as high as they heretofore generally have done, they will soon have to take this risk on themselves.

A WEEK ago serious labor troubles were threatened in England, many colliery proprietors having determined to enforce a reduction of 10 per cent in wages, declaring that such was absolutely necessary to enable them to keep the pits open at present prices for coal. Forty-five thousand hands would be directly affected by such a reduction. The present prospect of war with Russia is likely, however, to revolutionize the situation.



INGERSOLL ROCK DRILLS

....AND....

AIR COMPRESSORS.

The Latest Improved Ingersoll Rock Drill, with Large Ports, will do 20 per cent more work than the Old Ingersoll.

MINING MACHINERY.

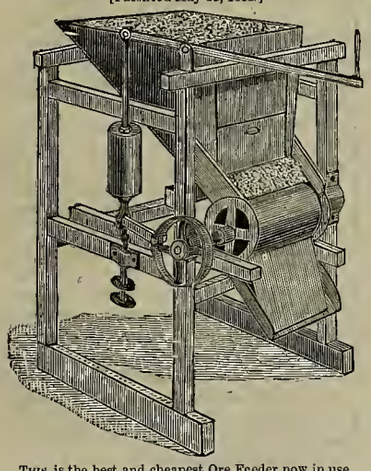
PARKE & LACY, Proprietors,

12 California Street, San Francisco, Cal

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

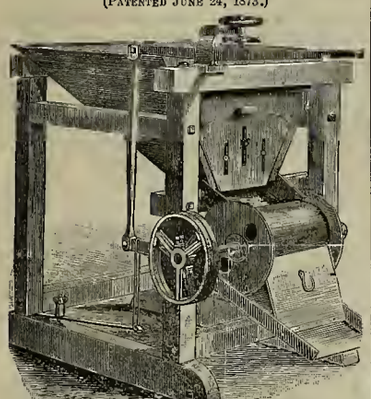
Golden State and Miners' Iron Works

Sole Manufacturers,

237 First Street, SAN FRANCISCO, CAL

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)



This form of Ore Feeder is well adapted for its peculiar work.

Manufacturers of the Celebrated "Challenge" Ore Feeders for wet and sticky ores; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ores.

☞Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

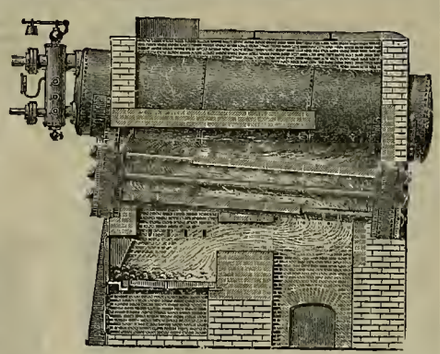
HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

THE CUMMER ENGINE CO.

CLEVELAND OHIO

SEND FOR 150 PAGE ILLS CAT-ALOGUE.

AUTOMATIC

Awarded highest premiums at Cincinnati and Louisville Expositions of 1883, for "Best Automatic Engine." We will furnish anyone copies of the ORIGINAL ENTRIES of several engine builders who claim they were not competing with us. They all entered in the same class with us, and now by deceptive Circulars (one headed "Fact versus Falsehood,") attempt to mislead.

☞*No premiums were offered for Condensing Engines.*

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.

For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Manufactured only by JENKINS BROS., 71 John St., New York.

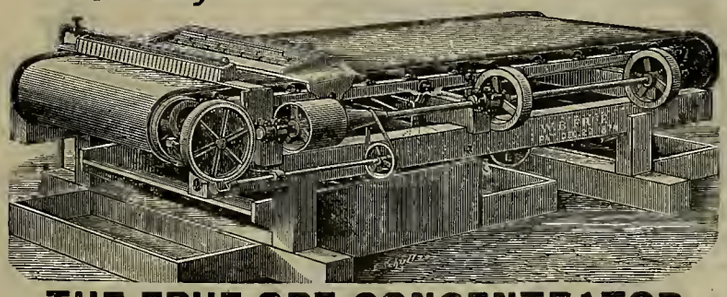
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

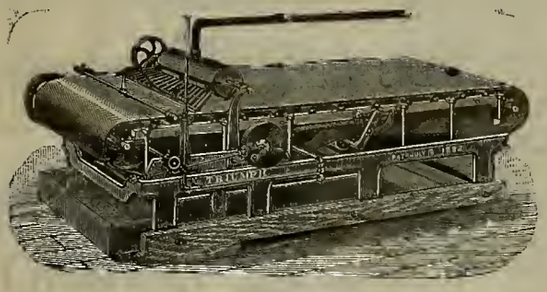
Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fiftsen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarly saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

....BUILDERS OF....

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 600 feet of five-eighths steel rope. SEND FOR CIRCULAR.

A New System of Ore Sampling.

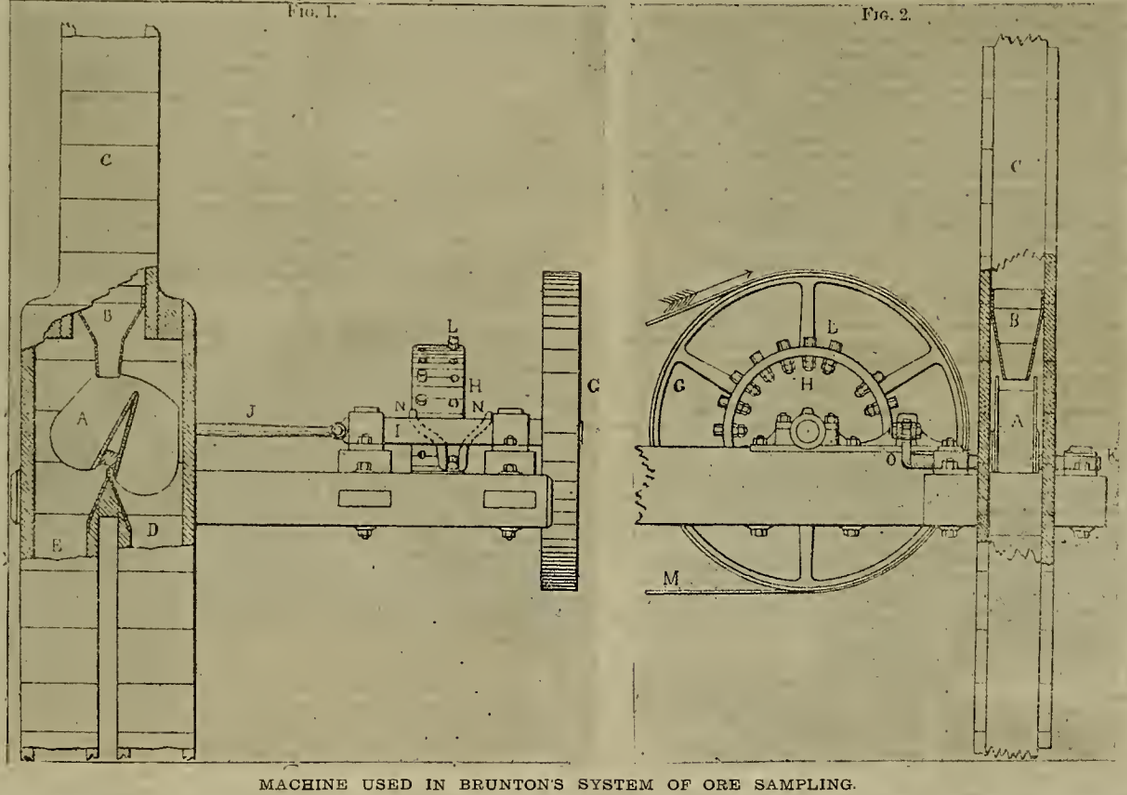
Sometime since the attention of Mr. D. W. Brunton, of Denver, Colorado, was called to the defect in the present methods of public ore sampling, and it was requested that he would investigate the matter and devise some method which would yield accurate results, satisfactory to both the miner and the smelter, and at the same time permit the sampling of ore with extreme rapidity, and at the lowest possible expense for attention and repairs. In a paper read before the American Institute of Mining Engineers, Mr. Brunton in describing a new system of his own, says:

After examining into the matter for some time, and taking into consideration the marked preference of the principal ore-buyers for coarse ore, the writer decided that it would be necessary, on account of the known objections to avoid splitting or dividing the falling stream, and instead of dividing the ore to make the division one of time — something which could be divided with exactitude and to infinity. With the new machine the sample is obtained by *deflecting* the *entire stream*, alternately to the right and to the left, the relative proportions of these two divisions to each other being determined by the difference *in time* between the deflections to the right and the deflections to the left. The construction and operation of the machine will be readily understood from the accompanying drawings, in which C is a vertical or inclined spout, containg a falling stream of ore; B is a funnel for narrowing the width of the falling stream, so as to reduce to a minimum the necessary travel of the deflecting-chute, A. This chute, A, is pivoted upon the rock-shaft, K. When it is deflected to the right the entire stream of ore is thrown into E; and when it is deflected to the left the entire stream is thrown into D.

The deflection is caused by the movement of the crank, O, receiving its motion from the driving-bar, I, and connected with it by the pitman, J.

The driving-bar, I, receives its motion from the pins, L, in the face of the revolving-wheel, H, which is driven by the pulley, G, receiving motion from a line-shaft through the belt, M. The face of the wheel, H, is perforated with two rows of holes, the distance between the two rows being the same as the necessary movement of the crank, O. Into these holes are inserted a number of pins, L, held in place by jam-nuts on the interior of the wheel-face. Preferably, twenty holes are bored in each row, each hole or pin representing five per cent of the time necessary for a complete revolution of the wheel.

Now, if fifty per cent of the pins are placed in the right-hand row of holes, and fifty per cent in the left, then the revolution of the wheel, H, carrying the pins, L, through the guides, N N, on the driving-bar, I, will hold the deflecting chute, A, on the right during one-half of the revolution, and on the left during the other half, thus dividing the stream into two equal portions.



MACHINE USED IN BRUNTON'S SYSTEM OF ORE SAMPLING.

If twenty per cent of the pins are placed in the right-hand row, and eighty per cent in the left, then the deflecting chute, A, will be held on the right during one-fifth of a revolution and on the left during four-fifths, thus throwing twenty per cent of the ore into the spout, E, and eighty per cent into the spout, D, etc.

In practice the wheel, H, is driven with considerable velocity, so as to make the divisions of time as minute as is practicable without injuring the machine by excessive vibration.

In improved machines now being built, although the principle is identical with the above, the construction is somewhat different. Sliding motion, always objectionable in dusty situations, is wholly avoided, and the pin-wheel, H, is enclosed in a tight iron case, filled with oil. This arrangement, while far from complicated, is exceedingly compact, the journals, wheel, case and frame being in one casting: but, owing to the position of the different parts, it is very difficult to explain by cuts; hence the employment of the other drawings in the foregoing description.

When in use the machine runs noislessly, without either jar or vibration, and never clogs, no matter how wet or how full of chips, rocks and strings the ore may be. Two of these machines have been running steadily for the past six months, during which time they have given complete satisfaction to seller, sampler and buyer. No errors in sampling have ever occured, even upon the richest ores. Not a cent has been spent upon either alterations or repairs, and the attention bestowed upon the machine has been restricted to a daily oiling.

As the stream of ore is neither split nor divided, fine crushing on large samples is entirely unnecessary. After the ore has been broken in a Blake or Dodge crusher, it falls into an elevator and is raised a few feet above the level of the storage-bins. The sampler is placed between the elevator discharge and the top of the bin, so that the ore falls through the divider which throws out, for a sample, any amount per cent to which the machine may be set.

In practice this amount varies from 10 to 50 per cent, according to the value of the ore; the richer and more "spotted" the mineral the larger sample should be taken.

The rejected ore drops directly into the storage-bins, while the sample falls through a spout into a pair of rolls placed on the same level as the breaker.

With most ores, from 10 to 20 per cent has been found to be amply sufficient for a coarse sample; and, as at least 80 per cent of the entire lot is generally sent to the smelter as it comes from the breaker, there is no objection to setting the rolls close, especially as they only crush from one-tenth to one-third of the amount of ore handled.

After being crushed fine by the rolls, the sample is raised by a smaller elevator to the same level as as first, and drops through a second divider, set to take any desired amount per cent.

The rejected ore falls into the bin with the ore from which it is at first separated, and the final sample drops into a closed and locked bin on the working-floor below.

On ordinary ores, 10 per cent of 20 per cent, or 2 per cent of the original quantity, is an all-sufficient sample; while on richer rock 15 per cent of 30 per cent, or 4½ per cent of the original quantity is perfectly safe. By this plan only a small proportion of the ore is crushed fine—a very decided advantage for smelting purposes over all of the other systems, which require that the ore must be rolled before a sample can be taken.

The two machines are driven at different speeds, to prevent any possible error which might arise from isochronal motion. In testing these machines by resampling lots of ore, it has been found that the limit of error is less than one-half of one per cent, while even the best "hand quartering" often varies as much as two per cent.

The weight of the sample actually taken even on the largest lots, never varies more than a few pounds from the percentage to which the machines are set. As the division is one of time, not of ore, it follows that the machines will take the percentage to which they are set, whether the ore passing through them be wet or dry, light or heavy, coarse or fine. This fact is of the utmost importance to the sampler, as it enables him to obtain a correct sample of intended mixtures, by simply passing the different lots through the crushing machinery in succession. Not only will the ore delivered in the sample-bin represent an exact average of each lot, but the amounts taken will bear the same relative proportion to each other as did the original lots, and the entire sample will consequently represent an exact average of the whole.

Under this system the cost of sampling is reduced to the lowest possible limit, the principal and almost only items of expense being power and the cost of wheeling ore into the rock-breakers; and since the accuracy of the samples is in no way dependent upon the skill of the workman, the very cheapest labor may be profitably employed.

The Western Union Telegraph Company threatens to take down the wire between Elko and Tuscarora unless the practice of using the telegraph poles for fuel, which prevails among teamsters, is stopped.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

King Gold.

EDITORS PRESS.—The letters of A. B. Paul and W. N. Griswold, recently published in the PRESS, are among the straws that show which way the wind blows, or rather, they are "cat's-paws" indicating the quarter from which the tempest will come. The sand-lot affair was only a premonitory and transient squall. The naive admissions of the first-named writer show that if his views lack profundity his heart is right.

My attention is particularly attracted by this sentence from Griswold: "It is well for all to begin to understand that much that we complain of is caused by a system which has in it the elements of periodical distress, *and ultimately of unbearable oppression.*" The Italics are mine, and I will add that if this system is not changed before America is filled, I pity the world.

While I agree with Mr. Griswold that a sudden change, that is sudden and profound, is not desirable, I will venture to predict that unless a gradual one takes place, and begins to take place rather soon, there will be one so remarkably sudden and thorough as to astonish some people.

If Thomas Paine could see the world to-day I think he would be compelled to admit that his views of political economy in 1792 were both short-sighted and superficial. The causes of the "evils of which we complain" lie deeper than forms of government; they exist primarily in the human heart, to use the conventional term; secondarily, in the structure of society which, instead of a homogeneous mass, is an aggregation of heterogeneous particles, loosely coherent by virtue of their collective needs, mutually repellant, warring among themselves, because of their individual desires which they mistake for interests.

This style of things is perhaps inevitable in the transition from barbarism, and as violent remedies have generally proved failures in the long run, it would seem to be the wisest part of of those who can in any degree, by tongue or pen or purse, influence the course of events, to endeavor so to direct the blind, stupid, yet terribly earnest, groping and yearning of the masses as that their efforts shall not recoil in disaster upon themselves. Particularly should the rich, many of whom really desire to benefit their kind, be made the subject of missionary enterprise on behalf of the religion of humanity.

It is a standing reproach to those who find fault with the present state of affairs throughout the civilized world, that they do not propose any remedy that has not been tried and found wanting, or that is not manifestly impossible. Fire and sword, dynamite and destruction, are in the first category; the perfect commune, the dream of enthusiasts, possibly the ultimate, but very remote hope of the human race, is clearly to-day in the second.

These facts, for facts they are in the opinion of many, have a tendency toward causing a feeling of despondency which, however, should not be allowed to prevail, for if we can only contrive to bring the ship of our modern civilization gradually to head in the right direction, such wreck as numerous other craft of similar character have suffered may perhaps be averted.

I am not a "socialist" as the word is understood. While I repudiate with scorn the silly and vapid argument of many who know not of what they speak, that "division would be useless since inequality would again arise," —the very principle of the commune is not to divide—yet I see clearly that the practicability of a true community on any extended scale is, to say the least, a long way off; but I affirm that the elements of the commune are in existence and in operation among us to-day, to a certain and an increasing extent, though not often recognized, and, if we can avoid a cataclysm, I believe that a satisfactory result will at least be reached, and then we shall be *civilized*. But it is hard for those who suffer much to wait. The cataclysm is imminent, and I repeat that it behooves all who can do anything to use their best efforts to avert it, not by attempting to maintain the *statu quo*, not by endeavoring to dam the gathering flood, not by erecting breastworks against the deluge, but by gradually opening such channels as may, by admitting of progressive movement, forestall and prevent the disastrous consequences of the sudden outbreaking of an "irresistible force" before which supposed "immovable objects" will be swept away like hay-stacks before the blizzard. As to finding or proposing remedies, it is certainly very desirable, but the inability to do that need not prevent our discussing a subject which will soon force itself upon the attention of all, even the butterflies. There may be something in Mr. Griswold's suggestion, if there is any practicable way of working it out, but I think he does not go deep enough by a very great deal. On the other hand I do not by any means imagine myself wise enough to solve a problem which has puzzled so many good heads, but I do think that before we can hope to accomplish much, we must abolish certain idols from the worship of which, our best political economists have not freed their minds. We must get down to some bottom *facts*, take our stand on them and work to build, not to destroy anything rashly, nor until we are ready to replace it by something better.

This communication is long enough. If it appears desirable, I will, in a future letter, offer a few suggestions as to what those idols are, and what those facts, or some of them, may be.

C. H. AARON.

Placer Mining and Electric Lights.

EDITORS PRESS:—I am prompted to address you by an item which appeared in the PRESS of February 28th, and an editorial on the revival of gold mining, which appeared March 7th. In the former you mention the fact that one Geo. L. Wright has gazetted a patent which annihilates the chief expense of producing electricity by appropriating the power in the current of rivers. Your illustration of the possible result of such an invention (if fully confirmed), of being able to light up the channel of the Mississippi like the streets of a city, is no less startling than true. But looking at its diversified application and use here in California, I conceive that it is destined to work a most marvelous advance in placer mining in the hills of northern California. Nearly four years ago, while writing up the placer mines of the Klamath river, I made the expression that an untold fortune awaited the man who should invent a method of arresting the limitless power going to waste in the current of the Klamath river; harness it and set it to work forcing water on to the high gravel hills which exist on both sides from Happy Camp to the ocean. If the invention which your paragraph mentions does the work claimed, will not my suggestion have become possible? The current of the Klamath will average nearly three miles an hour, and the gravel benches rise one above the other from 500 to 2,000 feet, and the higher they are the coarser the gold. The deposits in many instances cannot be exhausted in generations of constant operations. With such an invention what an open and broad field is here for the revival of the gold-getting industry. I regard this section of country as being marvelously rich in auriferous deposits, but that it has been skimmed over by the early prospecting adventurer, leaving the actual development to come with the application of close business methods to the work of mining. WM. AYRES.

Klamath River, April 16, 1885.

Good Clean-up.

The *Amador Sentinel* says: The excitement of the week has been all about the recent clean-up at the St. Julian, which only goes to prove the existence of a continuous streak of rich ore in that promising claim. For a number of weeks they have been working in a quiet way in a drift connected by a shaft sunk from the tunnel. This shaft is 25 feet deep, and they drifted south 30 feet and north 15 on a rich seam of ore, varying from a few inches to four feet thick. So far as we know all these horizontal strata make pay in butting against the slate wall, but in this case the formation was reversed, the big pay being close to the granite. Of course this stratum extended to the slate and was rich in metal close to the wall. In extracting this ore the miners kept the heavy, coarse ore separate, in full amounting to 800 or 1,000 pounds, and some of the pieces were large, heavy chunks of almost pure gold. Last Friday morning about 10 o'clock the 1-stamp mill was started upon this rich lot and by 10 o'clock the following morning the clean-up was finished. The retorted amalgam yielded something like 10½ pounds avordupois weight. On melting, the bar is said to weigh 168 ounces. Now convert this into troy ounces and we have 153 ounces and a fraction. The mint returns on a former bar from this mine rated the gold at about $17.50 per ounce, and at that price the present will yield something like $2,680. It must be remembered that only the lot mentioned was milled, together with a small quantity of common ore to keep the silver bright. The plates were heavy with amalgam. All of the tailings were carefully saved to be worked over at some future time. The second quality extracted from the same place amounted to about two tons still in the tunnel. Good judges think that when the whole is treated the company ought to realize at least $5,000. It is by far the richest strike ever made on this claim, and will doubtless stimulate the owners to continue prospecting. Recently they replaced the framework on the mill, added a new pulley run on the cam shaft, put in a Knight wheel, and now they have everything as convenient as one could wish. Ten inches of water from Horne's ditch is ample to run the mill. John Price is boss, takes all the responsibility and is getting rich by the sweat of his brow.

ITALIAN IMMIGRATION.—It is expected that the Italian immigration to this country this year will be greater than ever before. The industrial depression in Italy, growing out of the cholera last year, is unprecedented. Riots among the working people out of employment are prevented only by troops.

THE value of the ship-building industry of New England for 1884 reached $6,000,000.

Tuolumne Quartz Mines.

From the letter of a correspondent of the *Bulletin* we condense the following information concerning the mining interests of Tuolumne county, in this State.

Quartz mining is the only description of gold mining now prosecuted in this county since the exhaustion of the placers. The first quartz mine of permanency discovered in the county was the Soulsby, situated about ten miles in an easterly direction from Sonora, the county seat. This mine has, like many others, had its ups and downs, but since the time of its location in 1857 has yielded millions of dollars. The south shaft, from which the stoping has been done, and from which most of the gold has been taken, is down a depth of 700 feet, and a few weeks ago a new chute was discovered which is reported to be very rich.

Between the North Fork and Main Tuolumne River.

There is a group of mines situated between the North fork and the main Tuolumne river, all of which are considered good property, but perhaps the most promising one is the Buchanan. Like the Soulsby, this mine has passed through many vicissitudes. Rich on the surface, a poor spot, and the inevitable result, where mines are owned by poor men with nothing but their hands to work with. For want of capital to develop it properly it was abandoned, only to be reopened by a company, who after two or three unsuccessful efforts to discover the pay chute in turn abandoned it. The experiment was repeated with the same result until finally a company, of which Alviuza Hayward is a member, obtained possession of it and were successful in finding what their predecessors had been hunting for, with the result that there are now several tons of quartz on the dump taken from the chute while drifting, which it is estimated will pay from $100 to $1,000 per ton. The worst drawback to this mine is in its accessibility. The company, it is said, is contemplating the erection of a mill this spring and summer, and with that view have had a survey made for a new wagon road, which, to secure a proper grade, will necessitate a circuitous route and cost a considerable sum of money. Although the company are very reticent about the mine and its prospects, it is generally believed to be one of the best in the county.

Other mines in the same locality are the Hunter, Spring Gulch, Starr King, Sherman and Somerset. These mines were all rich on top, but require capital to develop them.

North Fork Mines.

The New Albany (formerly the Brown and Clayton), Grizzly, Consuelo and Bonito are situated on the North fork, but with the exception of the former have lain idle for a number of years. All of these mines were discovered during the early quartz excitement and at that time were worked and all yielded fairly. The mills on the three latter have been suffered to decay, and what remains of them stands as a monument to the once busy scenes along this stream. The mill on the New Albany mine was erected about eight years ago and is in good running order. A few days ago Dr. Walker set some men at work excavating for the purpose of erecting a larger wheel at the mouth of the shaft for hoisting purposes; and in blasting down the hanging wall a new vein was found which shows gold freely, and present indications are favorable for a good chute of rock.

New Enterprises.

Within the past year several new enterprises have been started, the most successful of which was the reopening of the Deadhorse mine by Messrs. Hayward, Skae, Davis and others of San Francisco. This mine is the south extension of the old Eureka mine, situated at Summerville. The Eureka was discovered soon after the Soulsby, and paid large dividends for a number of years. The mine was worked to a depth of 600 feet, but the chute pitched south at such an angle that it was so far away from the main shaft and so near the ground claimed by the Deadhorse location that the company concluded that the outlay in sinking a new shaft would not be repaid, and consequently the mine was patented and has been allowed to remain idle ever since its abandonment, some 20 years ago or over. With the collapse of the mine went the town, with the exception of a few families and the store. Those who remained turned their attention to farming, and but little mining has been done in the neighborhood until the recent starting up of the Deadhorse. Last spring Messrs. Hayward, Skae, Davis and others purchased the Deadhorse at a nominal figure and immediately commenced the work of cleaning out an old shaft sunk long ago. No one knew how deep the shaft had been sunk, and after cleaning out some 20 feet of slum, the bottom was found, together with a few old rusty drills, a striking-hammer and a crowbar, showing that the last shift left their tools and the mine never to return. On commencing work on this mine the calculation was made that the pay chute would not be found until a depth of 500 or 600 feet had been reached, but after sinking 100 feet a drift was run and a good vein discovered. The shaft is now 320 feet deep with a good vein in the bottom, and in each of the three south drifts, which are run at intervals of 100 feet. A mill will be erected on the site of the mine, the company being satisfied from the tests made of the quartz at other mills that the property will warrant the outlay.

The Lamphier mine, formerly under the superintendency of Richard Chute, of San Francisco, is, comparatively speaking, a new mine. It is but a short distance from the old Confidence mine, which in its day produced a large amount of gold, but which is now a mine of the past, as are Mt. Vernon, Excelsior, Plowboy, Greene and many other mines in that locality.

In the Cherokee district mining is at a standstill.

The miners are prodding away in the south end of the county with untiring energy. Most of these mines are new ones, and but little can be said with definiteness as to their worth. Messrs. Lang and Shaw have erected a mill on their vein and are now prepared to extract gold.

During the past few months, if reports are correct, a number of rich strikes have been made in different parts of the county, but whether these reports are authentic or not remains to be seen. Parties making these strikes are chary about giving them circulation, for reasons best known to themselves. The Chrysalline mine, situated on the mother lode, near Jamestown, it is said, is about to prove a veritable bonanza. According to report a rich strike was made in it, and it is claimed that the owners have between $100,000 and $200,000 in sight. It is also said that gold can be seen in the vein in such quantities that a magnifying glass is not needed to see it. According to the local papers a man, in digging a ditch near Jamestown, recently, came upon a quartz vein, and in a reasonably short time took out $30,000.

Eureka District.

At no former period in the history of Eureka have times been as quiet and dull as at present, and yet the prospects of the camp have never, in our opinion, been brighter. We base this latter statement upon the real merits which a host of the mines of the district actually possess. In all directions, from Mineral Hill on the north to Secret Canyon on the south, there are evidences of wealth which inspire hope and confidence that the bullion yield will again, just as soon as we get capital interested in our midst, equal that of the past. The number of producing properties in the district have never been greater, and could assistance be rallied in behalf of those who are now working their properties on the limited scale which necessity compels them to, there is no doubt but that the prosperous era we predict would shortly follow. Many locations which have hardly been known, even by name, to the oldest residents of the district, have, within the past few months, made such improvements as to convince the most skeptical that Eureka mining district possesses decided merit, and presents a field for capital as good, if not better, than can be found elsewhere on the Coast.

It is believed by many, beyond a peradventure of a doubt, that the Richmond Company have a large body of ore in their mine, which, when they get ready, will be extracted. The Eureka Con. mine is looking better to-day than it has at any previous time in the past year and a half. Ore of good quality is being extracted from upward of fifteen pitches in the property, and at the company's works all the bins and available space is glutted with ore awaiting reduction. It is estimated that they have on hand nearly 2,200 tons. At the Richmond works quite a good deal of custom ore has collected. The furnaces of the two companies, it is believed, will be in full operation by the middle of May.—*Eureka Sentinel.*

LOCATING A LAKE.—Almost, if not quite, the whole shore of Owens lake has been located, says the Inyo *Independent*. The power of attorney for making these locations was granted to L. F. J. Winkle, of Virginia City, and bears the name of 869 locators. The fees for recording the locations amount to $225.50. That much, at least, is assured to the county for the present. If the only object of making these locations was to make evaporating tanks for getting the matter held in solution in the water of the lake, then a mile or two of the lake shore would afford ample room for the most extensive operations that could be well conducted. By locating the entire circumference of the lake it might appear that the locators expect the entire lake to dry up, and they want to secure all the enormous quantity of matter that would be left in its bed. Before the bed of the lake could become dry Owens river would have to be diverted from its present course, and the water be disposed of in some other way. This implies irrigation on a scale of such magnitude as is hardly likely to be undertaken soon. In any event, if these locations will develop any new industries in the county, and promote the utilization of any of the natural resources, the county will be the gainer thereby, and the locators or promoters, no matter who these may be, should have the good wishes of the citizens of the county, and general countenance and support in their work.

TELEGRAPH wires have to be renewed every five or seven years. The Western Union Company exchange about 1,000 tons of old wire for new every year.

MECHANICAL PROGRESS.

Hidden Flaws in Metal.

What is really needed, says the *London Builder*, is some system, could such be devised, by which those hidden flaws which the very best metal, made by the very best process, will sometimes contain, should be rendered patent to the eye of an inspector. Is there any chance of such a system being devised? It is clear that chemical tests are quite useless; they can tell nothing but the general composition of the metal. Electric tests may possibly yet be used with effect. They were proposed some years ago, and have revived lately by Pro. Hughes, the inventor of the microphone. With this beautiful instrument, the "magnetic balance," he has proved that in wires or small pieces of iron almost all peculiarities of the metal, including the existence of flaws, can be detected with ease and certainty.

His invention has been freely given to the world, but heretofore the world (as usual) has been wholly indifferent to the gift. So far as we are aware, no railway or marine engineer has taken any steps with a view to ascertain whether a similar system might not be applied to pieces of large size such as those required in actual work. Failing this, mechanical tests in a proper testing machine do not seem impossible. If the axle which broke at Penistone, before having been set to work, had been subjected to a sudden cross-breaking strain, similar to that which caused its destruction, but very much below what it should be able to support with safety, we cannot doubt that the resulting deflection or bending would have been far greater than if the axle had been sound.

What we would suggest, therefore, is that all crank axles, or other pieces of metal called to fill equally important positions, should be tested by strains similar to those brought upon them in actual work, and that their deflections under those strains should be recorded. A few experiments would be sufficient to show clearly how great this deflection should be in the case of a sound and perfect axle; and if any specimen showed a deflection decidedly higher than the limit, it should be rejected as a doubtful quality. The expense of such a system would not be great when it once became a regular part of the manufacture of an axle; and it appears to us the only method by which a single faulty specimen can be weeded out from a batch of sound and satisfactory articles.

HYDRAULIC PRESS FOR COMPRESSING WOOD. The enormous advance which has taken place in the price of boxwood, which is largely used in the manufacture of loom shuttles, has directed attention to the possibility of procuring some substitute for this now very expensive material. It has been found that various kinds of timber can by compression be made to answer the purpose, and Sir Joseph Whitworth & Co., of Manchester, have just completed a powerful hydraulic press to be used in compressing timber for loom shuttles. This press consists of a strong cast-iron top and bottom, with four steel columns and steel cylinder, with a large saw. In the center of this ram is fitted a smaller ram with a rectangular head fitting into a dye, which is placed on the top of the large ram. The timber is placed in this die, and a pressure of 14 tons per square inch is applied. The pressure is then relieved, and the large ram descends. The top pressure block, which fits the die, is then removed, and the small ram rises and pushes the timber out at the top of the die. The timber so treated is made very dense, uniform, and close grained, and will take a high finish, and it is obvious that this is a process which might be applied with advantage in the substitution of comparatively cheap timber for the more expensive work for a great number of purposes.

THE BEST LUBRICANTS.—Each kind of work has some particularity which calls for special qualities in a lubricant. Without rehearsing the peculiarities of each of various kinds of work and what the special qualities of the various lubricants, it may be noted that as a general thing, where there is extreme cold, light petroleum lubricants are best; for enormously heavy pressures and slow speeds graphite (black lead, plumbago) and soapstone; for quite heavy pressures and slow speeds, graphite, and lard, tallow, and other greases; for heavy pressures and high speeds, sperm or castor oils; light pressures and high speed, sperm, refined petroleum, olive, rape, and cotton-seed oils; on ordinary machinery, lard, tallow, heavy mineral, and heavy vegetable oils; steam cylinders, heavy mineral oils, lard and tallow (black lead is good to use here, too). Watches, steam-engine indicators, and other delicate mechanism, should have porpose jaw oil, or olive oil purified by lead plates; or sperm or neatsfoot oils, properly clarified. The only way to test a cylinder oil is by an indicator, in the cyliuder of an engine (preferably the one on which it is desired to use it), under the speeds and initial pressures of every-day use. Run the engine with some standard oil, as lard, tallow, etc., take friction cards, and load cards; then run for a day with the oil to be tested, and then commence taking cards, with the same load on as before.—*Ashley's "Useful Facts and Figures."*

THERE are 420 steam-engines and 28 locomotives at Krupp's iron and steel works, Essen, Germany.

The Future of the Steel Business.

The secret of the present stagnation in steel manufacture, according to an approved authority, is to be found in the circumstance that the power of production is equal to 100 per cent over the present demand for steel rails throughout the world. At this moment the production of steel rail mills in the world over is equal in round figures to 4,000,000 tons. Of this Great Britain can produce from 1,250,000 to 1,500,000. From ten to fifteen years ago the production of rails was only half what it is now. "For the moment, doubtless," this authority goes on to say, "a period of difficulty is before us, but there has been one good effect which will be of permanent benefit."

This benefit is the economies which the necessities of the times have demanded shall be practiced in manufacture, with the result that "rails can now be sold at a price to leave a good profit which two years ago would have left an equal loss."

The future of the trade is not hopeless. This economy in the production of steel rails is also applicable to every other article to which steel can be applied. It is a fact, marvelous as it may appear, that steel can now be produced in the market at an even lower price than that of first-class iron. With the prospect of the substitution of steel for iron in almost every article in which the latter is used, the future of the steel trade can by no means be said to be hopeless. What the past has been in the matter of decreased profits, we are afresh reminded by the secretary of the British Iron Trade Association, who shows that in the seven principal ship-building centers of Great Britain the decrease in the tonnage built in 1884 on that of 1883 was not less than 435,000 tons, or two and a half millions less trade. The quantity of iron and steel used in ship-building in 1884 is calculated at 311,000 tons less than in 1883, and allowing an average value of $40 per ton over the whole quantity consumed, the decreased business in this department done by the iron and steel trades in 1884 as compared with 1883 is estimated at $12,500,000.

WATER AND STEAM POWER IN THE UNITED STATES.—It is stated in an English paper as an interesting and highly suggestive phenomenon in the industrial progress of the United States that there is a relative decline in the amount of water-power utilized for business purposes as compared with steam-power. This tendency is all the more suggestive by reason of the fact that no other country in the world is as well endowed with natural water powers as the United States. In 1870 the census showed that there were more water-wheels in use than steam-engines, and that their horse-power was almost as much as the total horse-power of the engines. The census of 1880, however, showed more steam-engines than water-wheels, and a total power far in excess of the latter. During the four years since the census was taken, the progress of steam-power has been greater than in any other four years of the history of the United States. The reasons for the great advance of steam-power are said to be that water-power is not as reliable as it was before the forests were thinned out or cleared away, while, owing to improvements to engines and boilers, steam-power is more reliable. Severe droughts and heavy floods have also both operated to set at naught the business calculations of those dependent upon water-power, while winter frosts and floating debris contribute to the annoyance and damage. The number of steam-engines used in 1870 was 40,191; water-wheels, 51,068. Ten years later, in 1880, the number of steam-engines exceeded the water-wheels—steam-engines, 55,404; water-wheels, 50,483.

VERTICAL BOILERS.—In some way, difficult to explain, the impression seems to have gained ground in many quarters that small vertical boilers are free from those elements of danger which must be so carefully guarded against in other and larger types. Naturally, these boilers are much liked for their portability, compactness and other advantages, and the large numbers in use have probably secured for them a reputation based on purely imaginary merits. So far as we know, they are neither much better nor worse as regards safety than other boilers—worse perhaps, because too much faith is put in them, and precautions which would ordinarily be taken are neglected. However this may be, the records of boiler explosions clearly show that they require fully as much supervision and careful periodical examinations as boilers of other types, and that, as regards the number of explosions, they are very fairly represented.

STEEL.—The fact is familiar to metallurgists, that a steel which is very flexible when cold often breaks at the blue annealing temperature. It has also been generally considered that the purer the iron is, the less subject it becomes to this defect. It appears, however, that the workmen in the Ural mountains, who use iron in remarkable purity, have often observed the same fact. It has also been found on investigation that the metal in question becomes powdery at at a temperature between 500° and 700° Fahr., or the temperature at which willow twigs take fire. This phenomenon would seem to explain a large number of accidents, as, for example, the breaking of tires under the action of brakes, and the fracture of riveted molds, and of machine arbors, which become heated by friction, hitherto regarded as unaccountable.

SCIENTIFIC PROGRESS.

Who Were the Mound-Builders?

In the early settlement of this continent by Europeans, as the Indians were driven back and the primeval forests were cleared for the proper occupation of the country by civilized people, evidences were found here and there throughout the Middle and Western States that a semi civilized race must at some prior time have occupied these extensive regions. These evidences consisted of great numbers of mounds, in many of which were buried rude implements and other evidences which it has generally been supposed must have belonged to a race quite superior to the Indians which then inhabited the country. For many years much speculation has been indulged in as to who these mound-builders were.

But of late the opinion has been gaining ground that the mounds were built by the ancestors of the Indians themselves. That the mound-builders were neither Aztecs, Toltecs or any other people more civilized than the Indians. That the mound-builders were not a great and united people, but that they constituted many distinct tribes. That they were many years ago, perhaps, less roving and warlike, and more inclined to the cultivation of corn for a winter's supply of food than they were at the time of the landing of the Pilgrims. The March number of the *American Antiquarian* contains a carefully prepared article by Professor Cyrus Thomas in support of the proposition, in which the evidence adduced appears quite conclusive. A previous article on the subject by the same writer appeared in the *Antiquarian* one year ago. *Science* of May 1st contained a review of a work on "Prehistoric America," by the Marquis de Nadaillac, in which it was held that "the mound-builders were no others than the Indian tribes found in Port Columbian time, and their ancestors." The reviewer agreed in the opinion of the author. In *Science* of April 3d there is a communication from Professor J. W. Powell, of Washington, in which that distinguished scientist agrees "most heartily" with the reviewer above referred to. Professor Powell says: "There has never been presented one item of evidence that the mound-builders were a people of culture superior to that of the tribes that inhabited the valley of the Mississippi a hundred years ago. The evidence is complete that these tribes have built mounds within the historic period; and no mounds or earthworks have been discovered superior in structure or contents to those known to have been built in historic times. The theory that the country was inhabited by a people highly organized as nations, and having arts of a higher grade than those belonging to tribal society, is wild and baseless; and the fruit of that theory is nothing but exaggeration and false statement. * * * At the present time we cannot have fewer than seventy distinct peoples among the tribes of North America, and in antiquity the number may have been greater. The mound-building peoples did not constitute a distinct race. Many peoples have built mounds on this continent, and some continue to build mounds to the present day. The writer has seen a tribe of Indians erect a mound."

Theory and Practice.

Theory and practice should go hand in hand. No science can advance without theory, but no person should theorize who does not understand something about his subject. A theorist who does not know the subject on which he theorizes is like a quack doctor. Progress can only be made by trial and experiment, and no one can expect to be successful except a person who is practical enough to be able to judge of the result. Theory is nothing more than generalized practice, or the result of experience reduced to a system; or, in other words, it is the principle of correct practice, but the true distinction to be recognized between theory and practice as terms, is that practice describes a set of operations which have not been methodized and reduced to a systematic form. Theory is the name under which a class of operations is generalized and their principles enunciated, although yet it belongs to that sort of philosophical guess-work called hypothesis. No practical man can avoid theorizing if he seeks improvement, because to practice is to imitate and stop short, to go further is to theorize, but theory would be useless without practice, and it is the practical man that corrects defective theories. Experience is the foundation of all applicate science, and experience can only be gained by practice, and theory without practice is mere phantasm.

In deciding whether it is possible to accomplish a certain object a man must first theorize. He must consider whether to gain his point he will have to overcome any natural law or laws. Every sane man knows that there is a limit to human power, a line so sharply drawn that he cannot fail to see it; therefore, in working out his theory he keeps within the limits, and shapes whatever he has to work with to meet the end he has in view.

In order to get a perpetual motion a man must first be able to *create* a power. Now we all know that a man can create nothing, and when he tries he is going beyond his limit. A good mechanic may combine wood and metals and make a machine to do almost any kind of work; a chemist may unite oxygen and hydrogen and form water, but neither of them have created anything. A man can not overcome natural laws; he must work in harmony with them to accomplish whatever he does; all else is failure.

WHAT IS MIND?—Go into the chemical laboratory of your own noble university—in honor of whose founder we are here to-day—and touch the two poles of a galvanic battery. What is it that thrills through your bodies, and perhaps even burns the skin of your fingers; or, if the current be strong enough, strikes you dead on the instant? Galvanism. What is galvanism? A force. Yes, and so is light a force, and heat, and gravitation. But when I am told this I am just as far from knowing what any one of the forces is as I was before. All that you could do, if I persisted in asking for a fuller explanation, would be to tell me something of the origin and properties of the force in question, and in this way I should obtain some idea of its characteristics, and should be in no danger of mistaking it for any other force. That is what your professor of physics does for you, and if you have only profited by the instruction you have received, you have a store of facts at your command that will enable you to recognize heat, light, electricity, gravitation, magnetism, whenever you see them manifested. When, therefore, you ask me what mind is, I answer that it is a force possessing peculiar properties, and developed by a substance constituting a part of the nervous organism of man and other animals, and known to antagonists and physiologists as gray nerve tissue. This is similar in all essential respects, so far as its terms are concerned, to the definition that you would give me of any other force. Of course it can be made more precise and extensive, but no enlargement would change its character.—Dr. Hammond's address at the Lehigh University.

KILLED BY AN AEROLITE.—An apparently authentic account comes from Somerset, Pulaski county, Ky., of the death of a farmer named Julius Rohble by a meteor which fell from a clear sky on the morning of the 1st inst. The meteor was very brilliant, emitting a light described to be more dazzling than that of lightning. It struck the man's head and instantly exploded, mangling his body frightfully. His clothing was torn and burned, and his body was streaked with burning streams of molten iron or detached stones of white heat. His limbs were charred and bent out of all shape. The meteor burned itself deep in the earth and sent splinters of itself in all directions, some of which were as large as a peck measure. A witness describes the noise it made as the roaring of a dozen locomotives blowing off steam. So swiftly did it drop that the rushing sound, the flash and the explosion were almost simultaneous.

OUR INSIGNIFICANT EARTH.—It is only when we regard our globe as a member of the planetary system, and that system in turn as a unit among systems, that we realize how infinitesimal are its concerns, and how really insignificant it is. We may, for practical purposes, consider the orbit of Neptune as the circumference of our planetary system, with a diameter of about five billions of miles. But if we could suppose this vast area converted into a solid globe, instead of being empty space as now, and given a highly luminous surface, it would appear to an observer upon the very nearest fixed star no larger than a half-dollar piece at a distance of some 200 feet from a human eye.

A WONDERFUL TRANSFORMATION.—A tadpole, the larva of a frog, has a tail and no legs, gills instead of lungs, a heart precisely like that of a fish, a horny beak for eating vegetable food, and a spiral intestine to digest it. As it matures its hinder legs show themselves, then the front pair; the beak falls off; the tails and gills waste away; the lungs are created; the digestive apparatus is changed to suit the animal diet; the heart is altered to the reptilian type by the addition of another auricle; in fact, skin, muscles, nerves, bones and blood-vessels vanish, being absorbed atom by atom, and a new set is substituted.

AN INCIDENT OF A LATE STORM.—The Marysville *Appeal* relates a curious incident connected with the April showers on Thursday the 9th inst. which took place on the Marcuse ranch, near the Nicolaus road in Sutter county. A man engaged in plowing about 100 yards from the road was thoroughly drenched by a heavy shower of rain before he could unhitch his team and get under shelter, while on the opposite side of the road not a bit of rain fell. Parties on the opposite side of the road witnessed the plowman's discomfiture without themselves receiving a drop of the moisture.

NEW SPECIES.—Surprise has often been expressed at the fact that no new species of animals seems to have appeared since the glacial age. Donald Mackintosh, writing in the *Geological Magazine*, advances an explanation of this, the new theory, which appears to be growing, that only a few thousand years had elapsed since the glacial beds were laid down.

RIGHT-HANDEDNESS.—It has been observed that "right-handedness" extends far down in the scale of creation. Parrots take hold of their food in their right foot by preference, and Mr. Crookes is inclined to believe that insects like wasps, beetles and spiders use the right anterior foot most frequently.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Machine Used in Brunton's System of Ore Sampling, 285. Standardizing Solution for Silver Assay; Kopf's Improved Saw-Set, 285.

EDITORIALS.—A New System of Ore Sampling, 281. Passing Events; Mining Superintendents; Mine Pointers; Air in Mines; Copper, 284. Kopf's Saw-Sets; Humid Assay of Silver Bullion, 285.

CORRESPONDENCE.—King Gold; Placer Mining and Electric Lights, 282. New Mexico, 285.

MECHANICAL PROGRESS.—Hidden Flaws in Metal, Hydraulic Press for Compressing Wood; The Best Lubricants; The Future of the Steel Business; Water and Steam Power in the United States; Vertical Boilers; Steel, 283.

SCIENTIFIC PROGRESS.—Who Were the Mound-Builders?; Theory and Practice; Killed by an Aerolite; Our Insignificant Earth; A Wonderful Transformation; An Incident of a Late Storm; New Species; Right-Handedness, 283.

USEFUL INFORMATION.—Petroleum a Wood Preserver; The Tupelo Gum and Willow Oak; Benzine Jelly for Removing Spots; Concerning Glass Cloth; Gum on Fruit Trees; To Protect Maps, Pictures, Etc.; Receipt for Mouth Glue, 287.

GOOD HEALTH.—Happiness a Habit; Sewer Gas a Cause of Measles and Pneumonia; Now and Then; When to Clean the Teeth; Cocain a Nerve Food; Moon Blindness in the Navy, 287.

MISCELLANEOUS.—Good Clean-Up; Italian Immigration; Tuolumne Quartz Mines; Eureka District; Locating a Lake, 282. Improving a Harbor by Hydraulicing; Working Manganese Deposits; Wire Ropes for Hoisting; Gold and Silver to the Front; Miners and Store Orders; Sweetwater, 286. The Enriched Grained Varieties of Redwood; American Saw-mill Machinery for Europe; Architectural; Lumber to New York, 287.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 288-89.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 292.

Passing Events.

The latest news over the wires indicates that the looked for war between England and Russia is only a question of a few days. In the event of war people in this State look for high prices for their products.

The proposed convention of mine-owners in opposition to the Miners' Union, at Wood River, Idaho, will be looked to with interest all over the Coast, as questions will come up there that will be of moment in all mining camps.

The spring is now so far advanced that prospectors have come out of winter quarters and are roaming over the hills again. We may shortly look for news of new finds in several parts of the Coast, where a good many miners have congregated in their search for new mining grounds.

In three years the price of copper has fallen off 20 per cent, and as it is being found in many places in large quantities it is not likely there will be a permanent revival in prices. But by these discoveries the uses of copper will be greatly multiplied, and in the future it will enter into many manufactures out of which its high cost hitherto has kept it.

About as much excitement exists this year at Coeur d'Alene as last. All the claims taken last year are being looked after, and active preparations are making for opening a vast amount of the new ground. A 3,000-inch water ditch is being built.

Mining Superintendents.

In the palmy days of mining in Nevada and California there was a certain class of mining superintendents employed at big salaries, whose duties were exceedingly light, and who established reputations for themselves entirely upon the work accomplished by those under them. This was notably the case on the Comstock, where there were superintendents who entertained visitors, looked after bullion, drove fancy teams, gave good dinners and "did the grand," while their knowledge of mining and metallurgy was in inverse proportion to their self-importance. These men cut a fine figure while money was plenty, assessments were paid promptly, and big works were being put up. Their responsibilities were small. They knew more about the stock market than they did about mines, and simply obeyed orders from headquarters where stocks were being manipulated. With good men supervising mine and mill, they went on swimmingly and really had a fine time of it; and the system lasted much longer than one would have supposed possible.

But the time came when the mines paid less; the people paid assesments grudgingly; the stock market attracted less attention, and the mines had to be worked on a less top-heavy system. Then the kid-glove superintendent had to go. His time was up. Knowledge of mining and milling became more necessary than the entertainment of visitors or the maintenance of "style." When it came to be required that practical work had to be accomplished with less expenditure, a different class of men came to the front. Those who gained their knowledge in underground workings, or near the pounding of the stamps, were more sought for. Men of executive ability who knew how to handle men to the best advantage, and knew the proper course to pursue to prospect and develop any given section of a mine were in demand. And it is this class of men who to-day are generally in charge of our best mines, while the "gentlemanly superintendents" of ten or fifteen years ago have "taken a back seat."

It is true, salaries are not so high as formerly, and duties are more onerous; while at the same time the grade of intelligence in mining matters has been raised. Trained and skilled men have displaced the mere ornamental figure-heads, who spent money with a lavish hand, secure in the feeling that it did not come out of their own pockets. It must be acknowledged, of course, that there were good men in the old days, as there are poor ones now; but, generally speaking, there has been a decided improvement of late years in the intelligence and scientific and practical knowledge of mining superintendents. Men having special knowledge of milling, smelting, concentrating, leaching, etc., are to be more readily found than was the case years ago; and in all matters concerning the development of mines there is more experience. The old-time superintendent cut more of a figure in the world than the manager of the present, but in practical results he was far behind his modern successor.

Mine Pointers.

Custom reduction works ought to be more plentiful than they are. There are throughout the country very many claims that are still mere prospects, for the reason that the owners cannot get their ores crushed and they have not got the means to develop their claims without some return.

When a superintendent strikes good ore in a small shaft in a mine he is opening it is by no means necessary to run off half a mile or more to locate a tunnel which shall tap the vein several hundred feet down. Better stick to the ore in the shaft and see if the mine develops. A good many men seem to think a tunnel site a necessary adjunct to every mine. There have been many mining operations which have proved unprofitable because too much time and money were expended on tunnel work, when they could have been developed just as well by the original shafts.

Dig is better than talk. The man who works at his claim and develops it will accomplish something more than he who simply blows about what it will be when developed. Miners can afford to leave the talking to that class of men who bond mines in hope of selling them without having to do any work.

In the contemplated purchase of mines, hereafter, it is probable there will be a more searching examination of the properties themselves before purchasing and a closer inspection of the peculiar conditions under which work must be carried on afterward. Next, rigid business application to matters of detail in the mining, marketing or reduction of ore, because properties will be sought for permanent operation at the hands of the purchasers themselves.

The demand for more custom concentrators in camps at a distance from reduction points is one that is bound to be met in time. Properly managed such works pay and are of the greatest benefit to the working miner. By their means he can realize quickly on the ore he gets out.

One of the curious tendencies of mine investors is thus satirically referred to by a writer in speaking of mines of Tuolumne county in this State: "What a dire misfortune it is that the facilities for working mines are so admirable! Here we have an abundance of good water for all purposes, with wood in endless quantities. If this were a desert tract of land, almost inaccessible, with fuel not obtainable, and water, even for drinking purposes an entire stranger, what a boom the strikes of the past four months would have caused!"

Air in Mines.

In the working of coal mines it is not only necessary to have an active and regular current of pure air, but the speed and volume of this must be regulated by the number of miners, the extent of the workings and the natural emanations of the mine. Very rapid air currents have been found to be dangerous, as they produce vacillation of the flame of the lamps. The measures against dangerous speeds of air current are only, of course, necessary in drivings and shafts where over.

The French Fire-damp Commission in their very elaborate report of recent date, recommend certain precautions which only differ from the English regulations in the special recommendations made with respect to dangerous speeds, recommendations which are found, in principle at any rate, in the most recent Belgian regulations.

In some special regulations of England and France it is forbidden to stop the fan, except on days when no working is carried on under ground.

The stoppage of the fan during the course of the day, at meal hours or during the change of shifts, to permit of oiling, for instance, is a practice which may cause danger, and which has occasioned accidents. The stoppage of the fan on days when no working is carried on permits of ascertaining, during the inspection preceding the resumption of work, which are the most gassy working places, and to what extent they are so.

The number of hours during which the fan should be kept going before the descent of the men naturally varies with the special conditions of each colliery, according to the abundance of the disengagement of fire-damp, the volume, and the speed of the air which is made to circulate.

It is not possible to lay down precise rules as to the quantity of fresh air that should be made to pass through a colliery; that depends, not only on its output but also on the greater or less amount of fire-damp that is evolved. As a guide, the rule generally admitted in Belgium may be mentioned, which gives 30 to 50 litres (1 cubic foot 103 cubic inches to 1 cubic foot 1,323 cubic inches) per miner, or 30 to 40 litres (1 cubic foot 103 inches to 1 cubic foot 713 cubic inches) per ton of coal extracted. It is understood that these quantities relate to those which pass really and effectively through the working places—that is to say, with the deduction made of all the losses which the air arriving at the bottom of the downcast shaft may sustain. These Belgian data do not differ greatly from those given by the French administration of mines—that is to say, 50 to 100 litres (under 2 to 4 cubic feet) per ton extracted, this figure being intended especially for the total volume of air exhausted. In fine, what is important in a given working place is to have the quantity of air necessary to prevent the fire-damp from being appreciable, without, however, the speed exceeding 2 metres (6 feet 6 inches) or at most 2½ metres (8 feet 2 inches). In return air-ways, where the men do not circulate as a rule, and where the speed may sometimes be greater, measures should be taken to prevent the quantity of fire-damp from attaining 2 per cent or 3 per cent, a proportion which is enormous, and even dangerous.

Copper.

There does not appear to be any very hopeful feeling among copper miners of any permanent improvement in the price of copper. It is true that more uses are being found for the metal—that is, it is being used for purposes which with former ruling prices would have been impracticable—but the product is now so very large that to find a market at all it must be sold very low. Some of the largest mines in this country have been working at a loss, and others may have to shut down altogether.

We look to the English market as the regulator of prices, and in the month of March there was an important fall in Chili bars, amounting to £2 2s 6d per ton. Previously £47 had been the lowest price on record; but on the 1st instant there were sellers of cash bare in Liverpool at £45 per ton, though 10s advance has since been paid on account of improved deliveries and moderate charters. This decline was caused partly by the fear of war with Russia, in connection with the delimitation of the Afghan frontier, but more especially by the announcement of a further large contract for Anaconda matte having been concluded with eight of the English smelters on terms slightly better than those of the previous contract, but still at a price comparatively much lower than is being paid for other furnace material, and very favorable to the purchasers, enabling them to sell English and manufactured copper at very cheap rates. As the price is fixed upon that ruling for best selected at the time of arrival of the matte, the lower prices accepted for English copper makes that paid for the matte all the lower.

James Lewie & Son's, Liverpool, report on ores and metals states that the quantity contracted for is a minimum of 10,000 tons or a maximum of 15,000 tons fine at sellers' option, delivery being spread over the rest of the year. 1,000 tons fine have also been sold to American smelters. The maximum quantity, together with that previously contracted for, will make the total production this year from the Anaconda mine about 20,000 tons fine, or nearly equal to the whole product of Montana last year. This does not look like any falling off in the supplies from this district during 1885.

The balance sheets of the four largest Lake Superior mining companies, after the Calumet and Hecla, with a total product of 8,380 tons (2,000 lbs.), have been published, and it appears from them that the cost of production varied from 10.95 to 11½ cents ₱ lb. As retail sales of this copper are being made at 11 cents, and the price under the contract is considerably below this, it would appear that Lake Superior copper cannot at present be produced to a profit.

In Liverpool in March there arrived 650 tons of Japanese copper which competes with English, Australian, Chili and American ingots. A considerable portion of the Montana matte now arriving in Liverpool was sold some time ago for forward delivery at 105 up to 105 9d per unit. The price now being realized for that sold on the basis of "best selected" is only about 85 per unit—a great difference. The arrivals from the United States for the month of March equaled 1583 tons of fine copper, and those from Chili were 2,860 tons. Chili exports for the first quarter of the year aggregate 13,186 tons fine. The stocks on hand are 28,290 tons fine in Liverpool and Swansea. Taking that from other countries, the total visible supply is 53,504 tons.

A table showing the imports into Liverpool and Swansea, compiled by James Lewis & Sons, will give miners in this country an idea of where all the copper comes from. It covers the imports into the two places mentioned, those to London being omitted. Of course the French imports are omitted also. The table is as follows and is figured in tons fine for the first three months of each of the years mentioned:

	1882	1883	1884	1885
From Chili	6,832	7,807	8,137	7,072
From United States	100	787	2,796	4,911
From Canada	66	108	160

New Mexico.

Fleming Mining District.

[Written for the Press by our Traveling Correspondent.]

Eight miles nearly due west from Silver City is this now well-known mining camp. The place is small but prosperous. The richness of the developed mines have given an impetus to development by small property-owners and prospectors, hence the general activity in mines in the immediate vicinity. The readers of the Press have often seen a mention of the celebrated Old Man mine. A description of this noted property will give mining men an idea of the formations, ores and methods of mining in this district.

The Old Man Mine.

Few mines in New Mexico have excelled this as a bullion producer in the same length of time. Less than 1,000 feet of shafts, inclines and tunnels, dead work included, has been done on the mine, and out of this $120,000 has been taken from the high-grade ores, and on the dump over 15,000 tons of low-grade that will average nearly $20 per ton awaits treatment. The formation is a contact between limo and shale. The ore body being quartz about 14 feet in width, carrying rich deposits of chloride and horn silver near the shale; the balance of the quartz being a low-grade.

A Model Property.

A two-compartment incline handsomely timbered follows the hanging wall down to the depth of nearly 200 feet. A number of drifts and tunnels have been driven in both ways from the incline, and rich deposits near the shale has been the order of progress under ground. Ore chambers have been stoped out and the bulk of the low-grade ores uncovered and can be speedily and cheaply extracted in the future. The latest and most practicable machinery, an economical and experienced management and an inexhaustible supply of excellent ore make the Old Man a model mine.

Mining on a Business Basis.

There are but few stock mines in the Territory that are conducted on the same business principles as this; in fact too much caution and not enough venture and push, considering the showing, is the motto of the company. The president and general manager, J. T. Seldomridge, has managed to pay for the purchase of the mine and distribute $39,684 in dividends in less than eight months. This has been accomplished with a force of 50 men and only high-grade ore shipped, the low-grade being held for treatment by a mill to be erected when the money can be spared from dividends and a lasting supply of ore is obtained.

Western Capital.

The Old Man is owned mostly by Colorado people, the principal owners residing in Colorado Springs, Colo. The cautious, business-like method of the manager is holding back the rapid and extensive development of the property. Notwithstanding a recent rich strike the work goes on in the same cautious manner. The ore on the dump would pay for the erection of a mill, and the ore bodies exposed in the mine will keep a good-sized mill going night and day for some time to come. General manager, Seldomridge, who owns the most of the mine, is somewhat of an invalid, and unless he is bought out or retired from the management the mine will continue to pay regularly as heretofore, but will not be opened up like a mine with the Old Man's showing should be.

The Treasury Mountain Group.

While the Old Man has attracted wide-spread attention by its rich deposits and heavy ore shipments, the group owned by the Treasury Mountain Company adjoining the Old Man on the east, bids fair to rival it in the near future. The location of these mines dates a short time previous to the discovery of the Old Man. The vein is a continuation of the Old Man, and the croppings across the face of the claims in places have yielded rich deposits of a very high-grade ore.

Development.

No earnest work of development had been done on any of the groups until during the past six months. Philadelphia people own the mines, and notwithstanding the reputation of the Quaker capitalists for sending out "the wrong man for the right place," they have secured the services of W. C. Hadley, a thorough mining man—not an office figure-head, but a practical mining and business man. In twelve openings on the vein ore has has been exposed. On the seven thirty-seven directly adjoining the Old Man a shaft 130 feet deep opens up a 12-foot vein of quartz the greater part of which is silver-bearing. Hoisting works will be erected on this mine. The Twin Sisters show ore, a number of tons on the dump being of a high grade. Work will be pushed extensively this season and excellent reports can be looked for from Superintendent Hadley's work. A diamond drill is kept busy at work locating in advance of the vein as it is opened up.

Concentratee.

Water is not scarce.

Wood is cheap.

Miners' wages are $3 and $3.50 per day.

Freight ratee on ore by teams to Silver City is $4.50, thence to Socorro $6, making $10.50 for both wagon and rail.

There is but little night work or sabbath labor in the camp.

There is very little ground about the hills that is not located.

The purchase of mining interests in this vicinity is a frequent occurrence.

The Silver Brick near town is taking out 28 oz. ore.

Joe MacDonald, a well-known and deservedly popular Colorado mining superintendent, is directing the workings of the Old Man mine.

The newly revised mining laws of the Territory, requiring a certain amount of work done inside of 90 days on all claims located, has opened up many a good prospect in Grant county.

A recent shipment of Old Man ore, weighing 1,148 pounds, returned the snug sum of $1,386.70.

Colorado capitalists appear to have an eye on New Mexico; a number of Colorado Springs business men own the Old Man mine.

The shipping ores of the Treasury Mountain Company's mines and the Old Man average $300 per ton.

The Caribou, a promising mine, has been allowed to fill with water, and is at present in a condition that would indicate a freeze-out, or a desire to purchase the property at a low figure by some one who knows its value.

A late strike in the Old Man has caused brisk work among prospectors.

There is little or no base metal in the ores of Fleming district. F. W. S.

Humid Assay of Silver Bullion.

From C. H. Aaron's work on "Assaying," parts II and III (just issued by Dewey & Co., 252 Market street, S. F.), we make the following extracts on the subject of the humid assay of silver bullion:

Owing to the uncertainty attending the fire assay of silver bullion, the humid method is used in all United States mints and first-class private offices. This method depends on the fact that

Standardizing Solution for Silver Assay.

silver in nitric acid solution is completely precipated in the form of chloride by a solution of common salt. At the same time the salt is decomposed, so that if suitable proportions of silver and salt be thus brought together neither can afterward be found in the liquid.

In the Royal Mint, in India, the precipitated silver chloride is dried and weighed, and from its weight that of the pure silver is calculated. In this country and in Europe the quantity of silver in the solution is estimated by the quantity of salt solution of known strength requisite for its precipitation. The salt solution is either weighed or measured. The latter method is the most general, and is called the *volumetric* assay.

Standardizing the Normal Solution.

A thousand of pure silver is dissolved in about 10 grammes of nitric acid of about 32 degrees Beaume in a bottle of clear glass, which will contain about 200 c. c. To facilitate action the bottle is placed in a vessel containing warm water. When the silver is dissolved the red fume which fills the bottle is blown out by means of an inserted glass tube, so bent as that the workman's face may not be over the bottle while blowing. As soon as the assay has cooled 100 c. c. of normal solution are added by means of the pipette and the bottle is put into a Japanese tin case or enveloped in a cloth to prevent the action of the daylight on the silver chloride which might slightly vitiate the result, and the stopper previously dipped in pure water is put in.

The bottle held, as shown in the diagram, is briskly shaken for several minutes, which causes the precipitate to curdle and settle rapidly, leaving the liquid perfectly clear. On placing the bottle on the table to allow of the settling, a brisk to and fro movement is given to it, so as to wash down from the sides any adhering chloride.

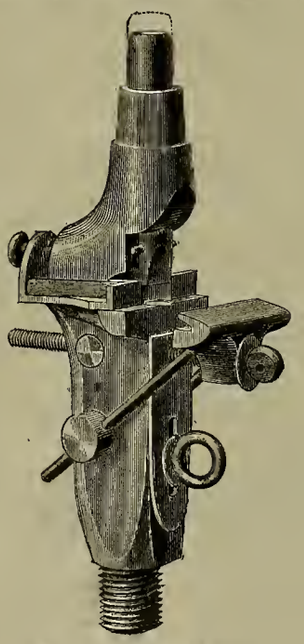
When the liquid is quite clear the stopper is removed and suspended in a clamp or bracket, so that the moisture part may touch nothing. A c. c. of decime salt solution is poured into the bottle. If, immediately or after a few seconds, a cloudiness is perceptible in the liquid, it is evident that the normal solution is weak, because 100 c. c. of it have not precipitated 1,000 of silver. The liquid must be again cleared by shaking, and another c. c. of decime salt solution added, and so on until no further cloud is produced.

A record of the number of c. c. decime solution used is kept, but the last one is not counted, because it produced no effect, and the one before the last was probably not required, so it is counted as half. Supposing that 7 c. c. caused precipitation, but the 8th did not, only 6½ must be counted. It now appears as though 1,006½ points of silver had been present in its solution, but it is known that there were but 1,000, because that was weighed; the normal solution is therefore 6½ points weak, and requires a corresponding addition of salt. The rules for quantity of salt and of water here follow in Mr. Aaron's book.

Kopf's Saw-Set.

Wilhelm Kopf, of Santa Rosa, Sonoma county, has just patented, through the Mining and Scientific Press Patent Agency, an improved saw-set adapted for even and correct work, and capable of setting the teeth of the saw at any desired angle.

The frame of the saw-set consists of a vertical piece having on one face a transverse groove or



Kopf's Improved Saw-Set.

recess, in the lower wall of which the die is set. The hammer, consisting of a suitable bar, passes through the top of the frame and extends downward into the groove or recess directly over the die and its lower end is properly beveled, as shown in the illustration, to adapt it to strike the saw-teeth. A spring around the hammer within its seat is the means by which it is returned.

There is a guide consisting of a bar, the forward ends of which are bent parallel with the length of the recess or groove. This guide is adapted to move back and forth by means of the set-screw shown at the rear of the device, which passes through its back into the frame. The object of this guide is to regulate the distance to which the teeth of any saw are to be inserted in the recess upon the die, and this is accomplished by reason of the teeth of the saw coming in contact with the bent and parallel ends of the guide, whereby the tooth about to be operated upon, is limited and adjusted in its position under the hammer. By properly adjusting this guide it is adapted to limit the teeth of various lengths.

In order to provide a rest for the blade of the saw, while its teeth are being operated upon by the hammer, the inventor has a bench or rest consisting of a strip or bar lying outside of and parallel with the recess or groove in the frame. This bench or rest is shown in front of the device, and it is necessary that it should have two adjustments—one away from or toward the die, whereby saw-blades of different widths may be accommodated, and another vertically, whereby the said blade may be set at any angle with the horizontal plane of the die, so that the teeth resting thereon shall be at such an angle as to enable the hammer to set them as desired. To accomplish the first of these adjustments there is provided a screw (shown in the engraving, projecting to the rear, with suitable turning hole in front) which passes through the bench or rest and through the frame. In its course through the frame it passes through a nut formed on a pin or bolt which is adapted to rock in its bearing for the purpose of allowing the second adjustment of the bench. By operating the screw through the nut the bench or rest may be adjusted closer to the die, whereby it is adapted to receive a narrow blade, or away from the die to admit a wider blade.

The second adjustment—the vertical—is accomplished as follows: It is necessary to support the bench or rest by means of suitable braces; but it is obvious that these braces cannot be fixed, but must have a movement to provide for the movement of the bench. Accordingly the implement has arms or supports (shown on the side of the frame) secured at each end of the bench or rest, and thence passing diagonally downward and loosely through the projecting ends of a pin or bolt, adapted to oscillate on its bearing.

Now it will be seen that the bench or rest may be forced downward, turning upon its main pivotal bolt or pin, and its movement being permitted by the arms moving back and forth through the pin or bolt shown on the side of the frame, which, by oscillating in its own seat, allows the movement of the bench or rest. Therefore, after setting the bench at any desired distance from the die, it can then be moved up or down to any angle with the horizontal plane of the die or groove, so that the tooth may be set at a suitable angle.

There must be, however, some means for holding the bench to the position adjusted, and to accomplish this a plate is provided, lying on the face of the frame, and having an elongated slot in its lower end, through which a set-screw passes. The slotted plate and set-screw are shown on the front of the frame, under the bench or rest. The upper end of this plate is mounted loosely upon the adjusting screw, which accomplishes the horizontal adjustment of the rest before described. When the set-screw of the slotted plate is loosened by turning the ring shown, the slotted plate is adapted to move up or down with the adjusting screw, as it is moved through its arc by the bench or rest; but when the set-screw is tightened, then the slotted plate becomes fixed and the horizontal adjusting screw of the bench or rest cannot be moved, and consequently is fixed in its position.

The saw is laid upon the bench or rest and its teeth adjusted up to the ends of the guide, so that one of the teeth is inserted in the recess over the die, and is adapted to be struck by the descending hammer; provision is also made for very narrow blades by making a slot or groove in the face of the rest, in which the rear edge of the narrow-blade saw is inserted and is thereby supported and guided while its teeth are being set. For further information concerning this implement, the inventor can be addressed as above.

Sierra County Mines.—From a private letter we learn that the Bald Mountain Extension claim, at Forest City, cleaned up last Monday for six days' work 129 ounces 15 pennyweights of gold; the Bald Mountain mine cleaned up 276 ounces. One nugget in the Extension sluice weighed 4½ ounces. The Extension lead is growing richer and as yet no south-west rim to the channel has been found. At Downieville the arastra clean-up last week at the Oro quartz mine for a six weeks' run was $1,300. There is an abundance of good paying quartz being found, and already the stock of this promising ledge is rising in value. There was a 10-stamp mill at the Oro in early days, and the mine at that time yielded princely returns. The chances are now that it may do so again in the future.

The Ontario, Utah, has made a twelve months' successful and continuous run, and will be shut down this month for a clean-up.

Improving a Harbor by Hydraulicing.

Digging Out a Bar with a Jet of Water.

The following article we take from the New York *Sun* of April 10: When Gen. John Newton and the United States engineers were trying to get rid of the Dimond Reef, near Governor's Island, in the autumn of 1878, it was tough work to remove the indurated clay and boulders. They got rid of all the rock near the surface, but when it had been cleared away to a depth of nineteen feet the work became so difficult that they were almost ready to abandon it. They were working for a 26-foot channel, but the boulders stuck fast in the clay and only a drill and blast could dislodge them.

Gen. Roy Stone, who commanded the Bucktail Brigade during the war, was one of those who were watching the work. He saw how slowly it was going on, and remembering the rapidity with which a jet of water tears away rocks and soil in the operations of hydraulic mining, he concluded that it would do the same thing under water on the Dimond Reef. The majority of the engineers held that this plan would not work because the water over the reef, as they thought, would neutralize the effect of the jet. One of them suggested that a sand-blast would do better. Still, the stream of water was worth trying, and Gen. Newton permitted the experiment. A hose was rigged to a powerful force-pump, and Tom Conkling, an old diver who had worked at reefs for over a score of years, put on his diving suit, took the hose, and went down nineteen feet to the reef.

"It's no use trying," he said before he sank.

When he got to the bottom he strapped the hose to his waist and held the nozzle firmly between his knees, with the end pointed beyond his toes. He pulled the signal string once, and the water was turned on. In less than a minute came two violent jerks, and then three rapid yanks. That meant to shut off the water and hoist him up. Panting and pale, Tom Conkling took off his helmet, and said:

"It'll work. It'll work, General. If you hadn't turned the water off I'd have been in China by this time."

The water jet had bored a hole in the reef directly under Tom's feet, and he had sunk to his waist before the water was turned off.

Everybody was convinced. A regular hydraulic jet machine was rigged up, and the clay was washed out, and the boulders were taken up by grappling irons till the channel was 26 feet deep. Gen. Stone perfected his invention, and last year it was patented.

Of the three ship channels through the Lower Bay Gedney's is probably used by more vessels than both of the other two together. It would be used by all, including the largest, if there were enough water over the bar. To accommodate modern commerce there should be at least 30 feet of water in the channel, but there is not more than 26 or 27 at ordinary high water. That is why the Chamber of Commerce has stigmatized New York as a second-class port.

In the River and Harbor bill of the last Congress $200,000 was appropriated for the surveying and deepening of Gedney's channel. Thereupon, Col. Gillespie, of the engineers, made preliminary surveys and proposals were advertised for. Gen. Stone having perfected his plans, bid $180,000 and got the contract two months ago. It provides that a channel 480 feet wide shall be cut through the bar, so as to give a depth of 28 feet at low water.

On Feb. 15th Gen. Stone began work on his plowing apparatus. Soundings showed that the bottom of the channel was hard sand, packed so firmly that it was not easy to sink a tube in it to get specimens. He chartered the powerful tug Osceola and had it refitted at the Delamater iron-works. Four pumping-engines of a capacity of 1,200 gallons a minute each were put in, besides a hoisting apparatus and three big electric lights.

On each side of the boat was placed a big iron pipe connected by a shoulder joint to the pumps. The pipes were 52 feet long and ten inches external diameter. At the lower ends they were curved forward and ended in two nozzles, one of which pointed upward at an angle of about 45 degrees and was 2½ inches in diameter, and the other opened directly in front with a slight downward inclination, and was 1¼ inches long and half an inch wide. At a pressure of 100 pounds to the square inch the pumps will send 4,800 gallons of water through the four orifices in the ends of the two iron pipes at a speed of 7,000 feet a minute. The action of the water is continuous, as the pumps are in double gangs and the stroke alternates.

A few weeks ago Gen. Stone put his machine in operation, and after a few trials and some slight changes in the machinery it has begun again, and in earnest, to scour and plow out Gedney's channel. The boat went out yesterday morning from the cove at Sandy Hook about 7 o'clock and steamed over to the north side of the bar. Then the hydraulic plows were lowered and the pumps began to work. The horizontal water jets drilled a path through the tough sand, and the upper jet blew the sand to the surface of the hay and scattered it. The ebb tide carried the sand out to sea at the rate of one and a half miles an hour. Particles of sand could be seen suspended in the foam and froth above the nozzles of the pipes. When the Osceola had crossed the bar, which is 4,000 feet wide there, the water plows were raised, and the tug went back to repeat the operation, working always with the ebb tide. It was just like ditching with a double subsoil plow. If the ground was dusty and the plow threw the dust and dirt into the air while the wind was blowing, the comparison would be complete.

Soundings yesterday showed an increase in depth of from 8½ inches to 2½ feet wherever the plows had been at work. Yesterday morning seven double furrows, each five feet wide, were cut in two hours. When the weather is favorable it is proposed to plow ten hours a day, five during ebb tide. There have been about 150 double furrows plowed so far. At the present rate it is believed that a channel 200 feet wide and 28 feet deep will be cut by June 1st; and there is apparently no reason why the operations should not be extended until a channel 480 feet wide and 30 feet deep at low water is secured. The work has so far been more successful than was expected.

"It is only a question now," said Gen. Stone, "of how many times the bar must be plowed over. That depends on how far the sand moves each time and how quick the tide will carry it away. Ocean steamers are aiding us. When the hard crust is once broken their screws stir up the soft sand beneath and it floats away with the tide. We are getting along faster than the soundings show, for packed sand increases in bulk when it is stirred up, and the first result of the plowing was expected to raise the bottom just as plowing a field raises the surface. Twenty-five per cent increase of bulk is always allowed for that. I have notified the Pilot Commissioners that the best water and softest bottom is where we are at work, and they can aid us by bringing the big steamers over our freshly plowed bottom. We have found dumpings from mud scows in the channel."

Working Manganese Deposits.

In a paper read before the North of England Institute of Engineers on the manganese deposits of the islet of San Pietro, Sardinia, Profcssor Leboni said:

San Pietro is a small island to the south-west of Sardinia, with an excellent harbor—Carlo Forte—on its eastern coast, six miles from Port Scuco, on the south-western Sardinian coast. The manganese mine is on the western coast, and consists of two concessions—Capo Rosso and Capo Becco—and of two "permissions of rescarch," the whole covering nearly 2,000 acres. The seam of manganese ore (black to brown) is of an average thickness of 1 foot, lying on a bed of soft whitish clay, containing fragments of trachyte, and forming the floor of the deposit; above it is some 4ft. 6 in. of jasper, above which again comes trachyte of various colors and qualities. The percentage of manganese in the best portions of the mine will be from 31 to 35 per cent, and the ore will contain from 7 to 13 per cent of iron. The second quality will contain about 20 per cent of manganese, and about 14 per cent of iron. In the more manganesiferous portions of the ore there is a considerable quantity of free silica, which must render this portion of the bed, to a great extent, inadaptable to the manufacture of ferromanganese. Manganese being scattered through the tufa, its presence as a crystalline peroxide in fissures in the trachyte is readily accounted for.

The mode of working is to drive cross-cuts from the gallery in the direction of the strike; a rise is then put up from this cross level through the bed; small beds four to four and a half feet high, and kept open by good timber at the sides and top, are next driven towards the rise of the bed. The men first hole into the soft clay floor with a somewhat curved pick, having a hammer-head prolonged some inches beyond the handle. The clay, which they constantly throw behind them, forms the *remblai* with which the old workings are filled up. The manganese is afterward brought down by sledge-hammer and long thick wedges. The ventilation is somewhat sluggish, and the temperature abnormally high, and although the mine is above sea level, the men work bare to the waist, even in winter. There is a large portion of water (20 per cent and upward) in some of the qualities as sent to market, which shows that some means of drying it should be adopted at the mine. A good round sum has been spent in attempting to solidify the ore by forming it into bricks, but as yet no satisfactory result has been obtained. The mine is cheap to work, or else it would have been useless to go on with any show of success, when so often, too, the bed contains on an average only 30 per cent of manganese. It can be delivered at about 16s. per ton f.o.b. at Carlo Forte, and in the year 1881 4,895 tons were raised, at a value of £6,600; and in round numbers 44,000 tons have been raised in all, realizing £57,700, giving an average value of 26s. 2d. per ton.

CŒUR D'ALENES.—Large numbers of men are heading toward the Cœur d'Alene mines in Idaho, and it is expected that fully 15,000 miners will go into the camp the present spring and summer. There is plenty of snow on the ground yet, and in several places it is two feet deep on the level. Discoveries recently made on the divide at the head of Dream gulch warrant the belief that the ridges on both sides of Prichard creek are veined with auriferous quartz. A 15-ounce nugget was taken from Yankee Boy claim, near Murry, by Ed. Kahler. It was taken to Portland, and assayed $192.50. Several five and six ounce nuggets were taken out, and many of less weight.

Wire Ropes for Hoisting.

The following remarks taken from a paper recently read by Mr. R. I. Frechville, H. M. Inspector of Mines for Cornwall, will prove interesting to miners:

Of all mining operations none is more important than that of winding, or has undergone more changes or improvements during the last quarter of a century, especially in the coal fields, where, in consequence of the increased depth and enormous output of the mines, great attention has been bestowed on this branch of mining engineering. In some instances from 1,000 to 1,500 tons of coal are drawn from a single pit in a day, the cages running at a speed in the shaft of from 1,500 to 2,000 feet per minute. The result is due not only to the shafts being perpendicular and powerful engines being employed, but also to the marked improvement of detail in the appliances used.

The rope to be used is a matter of the first importance, especially in those cases where the security of human life is dependent on its efficiency. The essentials of a good rope are flexibility and strength, combined with the least possible weight. Experience has shown that in the majority of cases these requirements are best fulfilled by round steel-wire ropes. Iron-wire ropes are fast going out of use, owing to the larger sizes required for given strengths, with consequent increase of dead weight to be subtracted from the useful load. It must, however, be borne in mind that where the water contains much acid, the injurious effect of this on a steel-wire rope would be greater than on an iron-wire rope.

The softer kinds of steel approached wrought-iron in character, bearing equal toughness, greater strength and the same capacity for welding. The following are the breaking strains for a square inch of some of the most usual varieties employed in rope-making:

Mild steel	from 40 to 50 tons
Best crucible steel	50 to 60 tons
" patent "	70 to 80 tons
" plow "	110 to 120 tons

Too great stress cannot be laid upon the necessity of having ropes constructed of the best material. The selection of the material, however, somewhat depends on the conditions of working. Thus, with a perpendicular shaft and large drums and pulleys, a plow-steel wire rope will be found the most reliable; but with small drums and pulleys, and a shaft with angles in it, a rope made of best patent steel or mild steel will last longer, as the wires are not so apt to snap in bending. In describing a wire rope, the number of strands, the number of wires in each strand, their gauge, the quality of metal, and the material of which the center or core is composed, should be specified.

Now as to the gauge, since the ultimate strength of wire increases as its diameter decreases, and since small wires are more pliable than large ones, it would seem that the finer the wire used the better; but there is a practical limit to this, as very fine wire offers too much surface to oxidation, and is too easily injured by friction. Experience has shown that it is advisable to employ medium-sized wires, between Nos. 10 and 15 of the Birmingham wire gauge. For ordinary work hemp cores or centers have been proved the best; they stretch with the strands, allow the wires to bed themselves solidly, and give ropes greater flexibility than could be obtained with wire centers. The latter have not given very satisfactory results in practice, although a greater breaking strain is obtained with a relatively smaller rope.

There are many modifications in the methods of laying or twisting the wires. Common laid rope has 6 strands with 7 wires in each, the size of the wire being altered to suit the size of the rope. Compound ropes—that is, ropes with more wires in the strands than in the usual construction, in addition to other varieties, have 6 strands with 19 equal-sized wires in each, or 7 strands with 6 wires in the middle of about 15 gauge, and 12 round the outside, alternately 15 gauge and 12. Ropes with 6 strands of 11, 12 and 13 wires each are frequently manufactured. Some makers prefer inner wires of each strand smaller, so as to be more flexible than the outer. Six strands in a rope are better than 4 or 5, as they make it more cylindrical, and consequently the friction is better distributed. Six strands of 19 wires each make very durable ropes. These work better than one of equal size composed of 6 or 7 wires in a strand, as the latter, being larger and less pliable, are more liable to snap in passing round pulleys and drums. When 3 or 4 of these wires break near together the rope is hardly fit for work, whereas the breakage of small wires would be of much less consequence. More material can be got into the same sized rope when compound instead of common laid, as the smaller wires do not leave so much space between each other.

THE Brotherhood of Locomotive Engineers was orgainized in Marshall, Mich., nearly twenty-four years ago. It has now more than 16,000 members; and has paid over $1,200,000 in insurance benefits, and given away over $500,000 to the needy, frequently not members of the order.

THE Suez canal is very largely used by English merchantmen. It is said that 90 per cent of the enormous trade between England and British India passes through the canal. Two-thirds of the business done through the canal is of Anglo-Indian origin.

Gold and Silver to the Front.

Base metal mines seem to be preferred in this region just now; but this will not continue much longer, as they are too expensive to work and the resulting profits are too small. Ere long the mines of Rock and Camp creeks, at the head of Croy gulch, will step to the front in public estimation, and occupy the position which gold and silver mines have occupied for the past 25 years. No kind of mine pays so well and at so little labor as a gold mine. Given a vein four feet in width, ore averaging not over $5 per ton, and, under proper management, it will yield a net profit of $2 per ton in a water-mill that would not cost over $200 to the stamp, or about $100 per ton of crushing capacity.

The mines of Rock creek, from all accounts (because, none of the ore having been put through mill process no reliable information of its value is obtainable), yield ores averaging fully $50, while the ledge—popularly known as the Big Camas vein—has a width of 10 to 60 feet. Even if the ore averages but $10 per ton, such a deposit must contain hundreds of millions of dollars, and the work of extracting this value will give employment to thousands of men.

These mines, which have been neglected heretofore, are about to be opened and exploited in a systematic manner. One mill—of 20 stamps, we believe—is already on the way here from Denver, and at least one more will surely be erected this summer. A strong syndicate, which will include one of the most energetic and long headed mining men in the world—Senator J. P. Jones, of Nevada—is, it is stated, about to begin operations there, and by this time next year the mines referred to will have been proved valueless, or mills of an aggregate daily capacity of at least 100 tons will be put in operation.—*Wood River Times.*

Miners and Store Orders.

Judge Ewing, at Pittsburgh, filed an opinion in the case of A. A. Kettering against the Imperial Coal Company, involving the question as to whether a store order given by any company to an employe is payment of wages within the meaning of the laws of Pennsylvania. Mr. Kettering had taken an order and received dry goods from defendant's store, but his counsel claimed he had not been paid in lawful money of the United States. The case went to the jury in this way, with the opinion of the law question reserved by the court. Upon this question the court says: "While we conclude that the act in question goes to the extreme verge of the legislative power, and that it is of a class of legislation of doubtful expediency, dangerous to the liberties and rights of the people, an importation from monarchial institution and in derogation of the broad liberties and rights which in the United States the people have heretofore enjoyed, yet we are not prepared to hold it to be clearly outside the powers of the Legislature and void." The issuing of store orders is made illegal in the act, and the court ordered judgment to be entered in favor of the plaintiff. The law in reference provides that all persons, firms, companies, corporations or associations, engaged in the business aforesaid, shall settle with their employes at least once in each month and pay them the amounts due them for work or services in the lawful money of the United States, or by cash orders, which must be redeemed in lawful money of the United States within 30 days and bear the legal rate of interest. The issuing of any order is deemed a misdemeanor under the act and is punishable by a fine of $100 upon conviction.

SWEETWATER.—Some Salt Lake parties interested in the Sweetwater, Wyoming, gold mines, report that a boom will hit that camp this season. A French company has secured control of 1,500 acres of placer ground, which has been thoroughly prospected, and is to soon commence the construction of a large water-ditch from the head of Rock creek, the Sweetwater and other streams. This ditch will be 22 feet wide in the bottom and over 20 miles in length, and will furnish an ample supply of water for working a vast tract of heretofore worthless placer ground. Besides this, some flattering developments have been made in several quartz claims near Atlanta, where a vein varying from seven to nineteen feet in thickness, and carrying from two to nine ounces of gold to the ton, has been opened up. Two or three hundred pounds of ore was received at Frank Foote's assay office a few days ago, from which a series of assays were made, and it is understood preparations are now in progress to work these mines vigorously. There is also some talk of a branch railroad, forty-five miles long, being built into the mines this season from a point on the Union Pacific near Green River. People living in the region of the old South Pass are to be congratulated on the prospect of a renewal of mining operations there.—*Salt Lake Tribune.*

THE geological survey of Japan, begun about four years ago by the geological office, is now declared completed.

The Enriched Grained Varieties of Redwood.

It was not until many millions of feet of the more richly grained redwood of California had been recklessly and thoughtlessly consumed for general purposes, that special attention was attracted to the fact that a considerable percentage of redwood lumber possessed characteristics of great beauty and inherent qualities as to shrinkage and in other particulars, which entitle it to favorable consideration among the ornamental wood of the United States for manufacturing and house finishing purposes. During the earlier periods, and until more recent years, the rich, curly "bird's eye" and other peculiarly marked species were cut for "rough lumber." The softer, straight grained kinds being so much more "easy to work," less liable to shrink endwise, and not so liable to split in nailing, became the favorite material for building and other purposes for which redwood was used, to the exclusion of the wavy and peculiarly grained varieties from the list of first-class redwood. Consequently, trees or logs indicating the very features which of late have given prominence to California redwood, were cut into plank, scantling, and dimension lumber, where size and strength were especially required; and millions of feet of choice grained wood have been split into railroad ties, and cut up for firewood, and otherwise destroyed, which, if to-day was available in board lumber and on the market, would command a largely advanced price over and above present merchantable, first-class redwood.

The redwood forests of California have yielded some most beautiful specimens of tree growth, which, for richness and peculiarity of grain, is excelled only by the finest of costly hard wood. The peculiarity of shrinkage endwise is, perhaps, special to this wood, but does not extend beyond thorough seasoning, which perfects itself much more rapidly than in California sugar or Eastern States pine. The value of the one discarded kind of redwood for manufacturing and finishing purposes has greatly increased during the past few years, and the present demand is greater than the supply of the "handsome variety," even for home consumption. Consequently manufacturers of redwood lumber are paying attention to this fact, and will in the future regard with special interest such trees as will produce the rich grained article.—*California Architect.*

American Saw-mill Machinery for Europe.—A correspondent writing from Berlin, Germany, to the American *Exporter* says that with few exceptions all the forests of Europe are to a certain extent exhausted, and that their production to-day is consequently not sufficient to supply the demand made upon them. France and Germany are therefore compelled to supply their wants from Austria, Hungary and Russia, which countries find it more difficult every year to satisfy their customers. In the north and south eastern part of Europe there are still large tracts of timber lands, but they are for the most part inaccessible to the lumbermen of the country for want of means of transportation or of suitable machinery. For these and other reasons, there must grow up the demand for better and more suitable saw-mill machinery, and the inference is that the machine of the future for those people must be only the American circular saw mill, which is comparatively unknown to them. It would seem, therefore, that the manufacturers of saw-mill machinery in this country have excellent chances in Europe which should be no longer neglected. The prices obtainable will bring far better returns than the manufacturer can realize here at home, and, if they start their business properly and shape the circumstances to the wants of the European countries, they will earn not only greater, but quicker, profits than can be obtained in the United States.

Architectural.—At the last meeting of the San Francisco Chapter, American Institute of Architects, a report was presented in which it was intimated that the best way to advance and cause an interest to be felt in the Chapter, particularly so by apprentices and draughtsmen in the various offices, was by the furnishing of a suitable room which would be recognized by parties interested as a home. The local organ of the profession thinks the idea is a worthy one, and suggests that a room should at once be secured and properly furnished. All the different journals and periodicals referring to architecture, carpentry, modeling, decorating, etc., should be kept on file. A room should be conveniently near in which a workbench could be placed, in order that practical lessons may be demonstrated in the various callings.

Lumber to New York.—The Oregon Lumber and Mill Company is shipping to New York samples of timber from that region. They say: "We were in hopes to send some timbers 20x20, 120 feet long, but could not get them into the ship's port. We hope soon to send a cargo of lumber East. We think that when the Panama canal is finished the Pacific Coast will ship a large amount of lumber to all Eastern cities." Of course all the lumber at present goes around Cape Horn, which indicates the cheapness with which lumber can be furnished on the Pacific Slope.

Useful Information.

Petroleum a Wood Preserver.

To the line upon line of practical tests long continued with petroleum for shingles, latticework, the timber part of tools, in short, all wood exposed to weather, a *Rural New Yorker* correspondent adds this strong confirmation:

"Fresh, light petroleum, if applied warm, will penetrate—if the wood is dry—almost as readily as water, and once thoroughly saturated, 'it is there to stay'—water will not wash it out. I have been for years a producer of crude petroleum, and have yet to find a board or piece of timber connected or otherwise with the works, that had been once saturated, which is not sound where the oil touched, while frequently parts not oiled have decayed rapidly. I have just finished taking down, and making over into smaller ones, a wooden storage tank. This was first built over eighteen years ago, and left exposed to all kinds of weather. We did not find one rotten spot in it; everything was sound. I have known oil barrels, and also small tanks, to be covered with a thin layer of earth and remain so, in one case for over fourteen years, and come out sound."

He especially states that, saturated with this moisture-repellent from nature's own laboratory, sills of barns and similar buildings will outlast any other part of the frame; and he remarks that after the first two or three days the application does not expose wood to any increased risk from fire.

The Value of Old Stamps.—The demand for old postage and revenue stamps by philatelists has given most of them a value above their face, a few of them going as high as $100 apiece or more. A Brattleboro stamp was sold for $300 last year, and the purchaser would not have sold it for much more. The standing price for this stamp is $250, as we notice from a dealer's catalogue, and we presume that he gets nons at that. The Alexandria, Va., 5 cent stamp of 1845 is worth $100; the Baltimore 5-cent stamp of 1846 also sells for $100; the red 5-cent stamp issued at New Haven in 1845 by Postmaster Mitchell is worth $15, and his blue stamp, $25. The New York City 3-cent stamp of 1842 on buff paper with picture of Washington has a value of $75; on violet paper, $25; the 1-cent stamp of 1849 on drab paper, $15. Ten dollars can be got for the 10-cent stamp issued at Providence, R. I., in 1846, and $35 to $25 for St. Louis stamps of 1845. Old Government postage stamps, that is, from 1847 to about 1860, bring from one cent each to $10. Stamps of later date bear lower prices, though two of 1869 are worth $35 each and one $30. Newspaper stamps are not so valuable. A new $60 lilac stamp of 1875, with picture of Indian girl and grapes sells for $65. A new 3 cent Post-office Department stamp of 1873, on white or amber paper, is worth $50; a new $20 State Department stamp of 1873 is worth $25, or $15 if used. New or unused stamps are in all cases more valuable than canceled ones, some of them having double the value.—*Paper World.*

The Tupelo Gum and Willow Oak.—The tupelo gum and the willow oak are timbers that are destined to a commercial value never until recently dreamed of. A gentleman residing in Mississippi, who has tested them thoroughly, says the first variety is almost as soft and light as the cork of commerce, and is the whitest timber in the valley. It is extremely light, and cannot be split, and at the same time it is very tough and tenacious and will bear a very heavy strain. It will, some day soon, be used principally for buckets, bowls, pitchers and trays; also for ox-yokes and for almost all kinds of water vessels. For bread trays it is the finest in the world. This wood grows among the cypress trees, and is far more abundant and floats like cork. The water or willow oak is second only to the liveoak, and is almost an evergreen; it takes the coldest weather to make it shed its leaves, and it is almost as hard when seasoned as the liveoak, and for the rim and spokes of wheels it has no superior. For ship-building it will almost equal the liveoak. "I have tested the crushing capacity of this wood," this Mississippian says, "and also the transverse strength, and it is one-third stronger than any white, post, red or black oak, and only one-eighteenth less than live-oak. And yet this wood has no market value!"

Benzine Jelly for Removing Spots.—120 ounces of white soap are dissolved in 180 ounces of hot water in a liter bottle, 30 ounces of ammonia added. The solution is then made up to three-fourths of the bottle by the addition of water, and the whole shaken up. A tea spoonful of this mixture is placed in a bottle holding 250 ounces, and mixed therein with some benzine, and afterward the bottle is filled with benzine under protracted shaking. The result is a gelatinous mass from which the benzine evaporates but slowly. It is useful in removing spots from articles of apparel.

Concerning Glass Cloth.—"Several years ago," says the Boston *Transcript*, "quite a furor was created by the announcement that a Pittsburgh glass manufacturer had discovered a method of spinning glass so fine and so pliable that it could be woven into dresses, outside wraps and garments of all kinds. The statement was received with incredulity, and a leading foreign journal, which published the statement of the discovery, felt called upon to apologize to its readers for having endeavored to dupe them. Several months later the manufacturers of the article caused the journal to acknowledge the receipt of a piece of the wonderful cloth. The eagerness to see the material was unbounded for months, and letters by the hundreds, from every clime, were received inquiring the cost of the novelty. The reply, $20 per yard, never brought back any answer and put an effectual quietus on the anxious correspondent. Genius had triumphed, but only partially. It was found impossible to manufacture the article for less than $20 per yard, and soon the furor over it subsided."

Gum on Fruit Trees.—Samuel Miller says in the *Rural World:* "As the war in Egypt is likely to make gum arabic scarce and high in price, those who have peach or plum trees can make their own mucilage. Lumps of gum will be found on every tree, which, when dissolved in water, makes a most excellent substitute. I have been using it all summer, and find it to answer the purpose first-rate. If this same juice was clarified, and while in the soft state sweetened with pure sugar and a little spice, it would be much better to eat than the pernicious stuffs that are sold by confectioners as gum drops, and which are, no doubt, made of some animal offal, and doctored up with chemicals, and which should have gone to the glue-pot at the start. There have been times here after rainy weather that pounds could have been gathered."

To Protect Maps, Pictures, Etc.—Coat a plate of glass thinly and uniformly with a warm mixture of one-quarter of an ounce of ox-gall and one quart of solution of glue, which will form a stiff jelly on cooling. When the film is set, render it insoluble by immersion for two or three hours in a solution of acetate of alumina, which may be formed by dissolving one ounce each of alum and of acetate of lead in a pint of water, and decanting the clear liquid from the sulphate of lead formed. Then wash and rinse well, give it an additional thin coating of a weaker glue solution, and lay the picture, slightly but uniformly moistened, upon it, face downward; smooth out by gentle rubbing, place in a warm room for three or four days, and remove from the glass when thoroughly dry, by cutting the film around it. The back of the picture may be coated in a similar manner, and it will lie flat without a frame.

Receipt for Mouth Glue.—Isinglass and parchment glue, each one ounce; sugar candy and gum tragacanth, each two drams. Add to them one ounce of water, boil the whole till the mixture appears when cold of the consistence of glue. Then form it into small rolls for use. This glue wetted with the tongue, and rubbed on the edges of the paper, silk, etc., to be cemented, will, on their being laid together and suffered to dry, unite them as firmly as any other part of the surface.

Good Health.

Happiness a Habit.

Every permanent state of mind is largely the effect of habit. Just as we can perform an action so continually that it comes to be habitual, so we can encourage conditions of mind till they, too, come to be habits of thinking and even of feeling. Every thoughtful parent or teacher recognizes this in the training of youth. The child constantly thwarted or scolded or ridiculed has constantly aroused within him feelings of resentment or discouragement or misery, and these grow to be habitual, and a character for ill-temper or moroseness or despondency is formed. On the other hand, the child who is wisely treated, whose faculties are brought into action, who is encouraged to do well, who is surrounded with cheerful faces and orderly arrangements, becomes accustomed to corresponding habits of thought and feeling. The exercise of self-control, of truthfulness, of honesty and other essential qualities, not only results in habitual actions of the same nature, but in habitual feelings or state of mind that induce those actions. So the condition which we call happiness is likewise acquired to a considerable degree. It involves within it many things but they are not impossible to secure, as when we have discovered them it rests with us to encourage or discourage them. Happiness is not only a privilege but a duty; not a more outward good that may perhaps come to us, but an inward possession which we are bound to attain. When we remember the contagious character of happiness, the strength, courage and hope it excites by its very presence and the power for good it exerts in every direction, we cannot doubt our obligation to attain as much of it as is possible.—*Pa. Ledger.*

Sewer Gas a Cause of Measles and Pneumonia.—Attention is called by the *Sanitary World* to an extraordinary outbreak of measles among the children of a public institution, caused by sewer gas. The medical officer states that in the early part of October the drainage became choked, and the sewers had to be opened. During the progress of the work the house became filled with sewer gas, and for some hours the evil was almost intolerable. Thirty-one days afterward an outbreak of measles and pneumonia took place, the whole of the children, 25 in number, being almost simultaneously affected. There were four deaths, and the cases were of a severe type, with high fever. While lecturing on healthy houses to the students of the Women's Medical College this season, the subject of sewer gas came up for some remarks, when one of the students, whose husband is a physician, remarked that she had two children. The bedroom in which they slept had the ordinary wash-bowl, with faucet for hot and cold water. The children coughed considerably during the night, and suffered with sore throats most of the time. The husband, suspecting that sewer gas might possibly enter the room from the water pipes during the night, had them closed. The result was, the coughing ceased at once, and the children have not been troubled with it since.

Now and Then.—There are many firm believers in the theory that most people are crazy at times, and facts seem to support their belief. A wise man will step backward off a porch or into a mud-puddle, a great philosopher will hunt for the specks that are in his hand or on his forehead, a hunter will sometimes shoot himself or his dog. A working girl had been feeding a great clothing knife for ten years. One day she watched the knife come down slowly upon her hand. Too late she woke out of her stupor with one hand gone. For a few seconds her mind had failed, and she sat by her machine a temporary lunatic and had watched the knife approach her own hand. A distinguished professor was teaching near a canal. Walking along one evening in summer he walked as deliberately into the canal as he had been walking along the path a second before. He was brought to his senses by the water and mud and the absurdity of the situation. He had on a new suit of clothes and a new silk hat, but, though the damage was thus great, he still laughs over the adventure. Our mail collectors find in the iron boxes along the streets all sorts of papers and articles which have been put in by some hand from whose motions the mind has become detached for a second. A glove, a pair of spectacles, a deed, a mortgage, a theater ticket goes in and on goes the person holding on to the regular letter which should have been deposited. This is called absent-mindedness, but this is a brief lunacy. A lunatic is a person whose mind is habitually out of balance.

When to Clean the Teeth.—Of all the people who clean their teeth regularly, it is certain that a very large proportion only do so once a day, and that generally at the time of their morning ablutions. A much smaller number also do so at retiring, but the number of those who make a practice of regularly brushing their teeth after eating, the most important time of all, is indeed very small. It is while eating that all the little cavities or interstices between the teeth become the repositories of fragments of food, or traces of some acids in the food are left in the teeth to cause incipient decay, and hasten it where it has already commenced. It is of course desirable to brush the teeth on rising in the morning and before retiring at night, but it is of infinite more importance that they should be thoroughly cleaned after eating. Decayed teeth, Professor Busch, of Berlin, holds, is peculiar to man, never having been observed in any animal. It is more prevalent among some races than others, and seems to affect the whole race. In this respect pre-historic man has no advantage.

Cocain a Nerve Food.—Dr. Aschenbrandt, of Wurzburg, has made some experiments on the action of murate of cocain on the human organism. He administered the drug, unknown to the subjects (who were soldiers), in doses about one sixth of a grain in cases of exhaustion and fatigue from various causes, and found invariably that the lassitude was speedily removed, and that the men could go on for hours without feeling hunger or thirst. One of his experiments was made on himself after a sleepless night, with the prospect of a long day's march before him, when a dose of cocain (taken in coffee about 3 A. M.) enabled him to go the whole day without feeling hunger, thirst, or fatigue, and he dined late in the afternoon with his usual appetite. He considers the drug to be a direct nerve food, and not a stimulant merely; but its stimulatiog action is certainly far above that of alcohol, and it appears to have no injurious after affects.—*Medical Rec.*

Moon Blindness in the Navy.—Vice-Admiral Close, of the British navy, has offered a singular explanation about the loss of the gunboat Wasp, recently wrecked off the Irish coast. There exists, it seems, a form of defective sight known as "moon blindness," persons afflicted with which are unable to perceive a light shining in darkness. It is easy to see the consequence of this infirmity in the navigating officer of a ship. Admiral Close says he nearly lost the man-of-war Trident once from this cause, only discovering in the nick of time that his navigating officer was unable to see the light of a lighthouse half a mile distant. If "moon blindness" is an established fact in medical science, the sooner provision for detecting it is made the better.

The organ of hearing is generally double, but not always located in the head. In the clam it is found at the base of the foot; some grasshoppers have it in the fore legs, and in many insects it is on the wing. Lobsters and crabs have the auditory sacs at the base of the antennæ.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

SMALL PROFIT.—Amador *Sentinel*, April 26: P. Reichling has been extracting quartz from the croppings west of the Kennedy, and milling it at the Kennedy mill, running ten stamps on the same. It does not pay anything big, but yields a small profit above expenses. He expects to make another run shortly. I. N. Dewitt is prospecting in one of his upper tunnels at Murphy's Ridge. In sinking on strata from the surface they reach a slip or slide of the hill to the east which have thus far cut off all the pay seams he has worked. In this tunnel he is working below the slip. This gives him a chance to prospect all quartz in solid ground, and should he find pay he will have to sink. He is in a good locality, one from which he has taken considerable gold. Several parties are working on Murphy's Ridge on shares with varing results. Nevills has a force of men at work on the so-called lime-kiln lead a few hundred feet south of the old Moon hoisting works. At present they are down about 30 feet, using a windlass for hoisting. The present size of the shaft is three and a half by five feet in the clear and are in the dry ground, but expect water in another ten feet. This shaft was sunk a number of years ago and said to be 70 feet deep and a number of tons of ore extracted and milled, but for some reason work ceased. A platform was put in at about 40 feet, and from that point up the timbers were taken out. If the old works are in good condition it will be an easy matter to reach the bottom and give the owners a good chance to prospect the ledge, and the result of such prospect will determine future operations. The donkey engine has not been set up as yet, and will not be, unless they find difficulty in draining the shaft. At the above depth the workmen have a vein of fair looking quartz a foot wide and a gouge on the hanging wall. Should the prospects be favorable it is said that future operations will be at this point. J. T. Wheeler picked up a nugget, said to be worth $110 the other day in the Grass Valley mining claim above Pine Grove. D. A. Crockett, near Pine Grove, recently sold a lot of sulphurets and base ore to the chlorination works at West Point, realizing $1,000. Two of the large engines at the Oneida mine, together with three boilers have been removed, destined for a mine in some part of Montana, but not owned by the same company. Only one engine and a boiler remain. From the indications this company will probably never make any further efforts to work this claim. Only a few men are employed at the Volcano tunnel, washing only when the dams become full.

RICH ROCK.—Amador *Dispatch*, April 28: Last Saturday, at the St. Julian mine, some 14 pounds of gold bullion was retorted from 18 pounds of amalgam that was crushed with one stamp in their mill in some 12 hours swing of the stamp. A. Caminetti, John Price, Dr. Chambers, D. Martin, Jos. Chatam, Pat Kelly and others were at the mine and mill while this retort of bullion was taken out. The St. Julian mine and mill is on the corner of the ranch of Dr. Chambers, and about six or eight minutes walk from his house and about five minutes from the ranch of W. A. Nevills of the Mammoth mine which the St. Julian joins on the south.

Alpine.

QUARTZ MILL TO BE MOVED.—Alpine *Argus*, April 25: A quartet of miners came to town last Tuesday from the Mammoth mining district, Mono county, to purchase a stamp-mill and outfit. They succeeded in securing from Mr. John Weis a mortar and five stamps from the old Advance mill, on the road between here and Mt. Bullion. They will proceed immediately to get the stamps ready for shipment to Mammoth where they will be erected.

Calaveras.

STRUCK GRAVEL.—Calaveras *Chronicle*, April 25: Pay gravel has been struck in the What Cheer mine, in Chili gulch. After clearing the mine of water, a bedrock tunnel was run in order to straighten the main tunnel and facilitate the work of getting out the gravel. The cutting through this bedrock has required some time to do, but it has now been accomplished and a bed of gravel 6 ft. and over has been encountered in a direct line with the main tunnel. The gravel is of good quality, prospecting well. The mine so far is looking very promising.

THE BODE MINE.—While in San Andreas last week we were shown some specimens of quartz taken from the Bode mine situated just outside of the town which, to say the very least, are exceeding rich. The pieces of rock shown us were full of free gold in large portions scattered all over the quartz. The Bode mine was discovered in 1852, and has been worked at intervals ever since. In the year above mentioned, a shaft 80 ft. in depth was sunk upon the mine and other prospects made along the lead. The mine is now owned by Mr. H. Bode, the hardware dealer of San Andreas, and Mr. William Wallace of that place, Mr. Bode owning the controlling interest. A shaft in the neighborhood of 80 ft. has been sunk and a tunnel of about 100 ft. in length has been run on the vein. Some of the rock which was milled yielded $10 a ton. Another shaft is now being sunk upon the vein and the prospects are flattering in the extreme.

El Dorado.

TUNNEL.—Placerville *Observer*, April 24: The contract recently let for running the 50 feet in the Darling mine, over on Bear creek, by H. P. McNevin, having been completed last week, and the ledge continuing unbroken, about the same, a contract to extend the tunnel 50 feet was let. The ledge is 2½ feet in width, and will mill about $7.50 per ton, as near as we can ascertain. If the ledge holds as good for the next 50 feet, it strikes us that it is one of the best partially developed mining properties in the county to gamble on. The walls are slate on one side and granite on the other, with a vein of living water along it—a good characteristic for a permanent ledge.

IMPROVING.—Georgetown *Gazette*, April 22: T. F. Lewis' quartz mines near Slate mountain, is improving as development progresses, so much so that parties are anxious to bond the mine. Since crushing began on the Slate mountain mine, some two or three weeks ago, exceedingly good results have followed. We are pleased to learn the Grover boys are meeting with gratifying results in their work of development on the southern extension of the above mine. Work on the Idaho mine of Georgetown, preparatory to placing the mine in permanent working order, is being pushed ahead with vigor under the management of Steve Moore, of Grass Valley. The St. John drift mine at Tipton Hill, is being started up by J. W. Houston, of Sacramento county.

Mariposa.

DILTZ GOLD BONANZA.—Mariposa *Gazette*, April 25: The ore body which developed from the surface wash of last winter improves as the work progresses. The ledge in this new shaft is increasing in width and improving in quality. As it is all virgin ground above the tunnel level to the north for 1,700 feet, it is impossible to estimate the number of tons of milling ore now uncovered. The hundreds of tons of ore and vein matter which have passed through the wash during past seasons when water could be obtained for sluicing purposes, has already paid an average of $15 per ton leaving large quantities of quartz containing free gold, which is piled up, yet to be milled.

IMPORTANT SALE.—The Eureka quartz mine, of Hornitos mining district, has been sold by S. C. Bates, banker of Merced, to a company, of Providence, R. I., for the sum of $75,000 cash. The sale was effected through reports made upon the property by S. E. Holcombe, M. E., of San Francisco. The two mills are running upon rock taken from the mine, and large results are expected. Other properties are being examined by S. E. Holcombe, and if found favorable, sales will be made at an early day. The Paddy M'Cann mine, which is a continuation of the Diltz mine, is simply awaiting development to blossom out to be a good mine, with the chances of being as good as any in that neighborhood. Notwithstanding this mine has been claimed for many years, all that has ever been done is a shaft about 50 feet deep. The Schroder mine, which is close by on Saxton's creek, is held under a U. S. patent as a placer mining claim, containing 20 acres. Mr. Schroder procured a patent for his claim several years ago, since which time he has constructed a ditch about two miles in length taking the water from the head of the creek to a point below where he is compelled to jump the creek, about 75 yards across, spanning it at the highest point, 100 feet, which carries the water to the heavy deposit of his claim. Whenever there is sufficient water his Little Giant is called into requisition which confronts a bank of dirt and gravel from 10 to 30 feet deep. Notwithstanding the quiet manner in which Mr. Schroder has work his hydraulic, enough has leaked out to the public that it contains gold in unknown quantities and sufficient has been gathered into the family purse to warrant an outlay of some thousands of dollars in improvements to work the mine upon a scale larger than the ordinary mode of extracting gold from placer claims. This neighborhood of mining is proverbial for its quiet, reticent and unobstrusive manner in which the mines, veins, hill and gulch diggings are worked. There are other good mines in this neighborhood that have been secretly worked for years by men well known to the community, but they have become so commonplace in their daily vocation that no notice is taken of them, while at the same time it is believed they have lots of the rich metalic substance stowed away.

Mono.

THE CON. PACIFIC.—BODIE *Miner*, April 27: Since last report have no material change to note neither in northwest drift or in the cross-cut. The ledge in face of the northwest drift is 8 inches in width. Have had no assays during the week as ore is about the same quality as when the last assays were reported. Advanced during the week 7 ft., in cross-cutting cut some good looking stringers ore that have been very encouraging. The advance was 8 ft. Everything looks well.

THE BODIE CON.—The joint Bodie and Mono upraise, from the 550 ft. (Lent shaft) level, is now up 282 ft. The south drift 500 ft. level, is in 164 ft. The north drift 300 ft. level, is in 28 ft. The winze below the 300 ft. level is down 10 ft. Twenty-two men employed.

THE MONO.—The south drift from the Mono winze, 90 ft. below the 600 ft. level is in 13 ft. The south drift, 550 ft., (Lent shaft) level, was advanced 17 ft, being in 320 ft. from the Bodie line. The joint upraise is up 282 ft. Eleven miners and one engineer employed.

Nevada.

NEW QUARTZ MILL.—Grass Valley *Union*, April 22: Joseph A. Everett came down from Omega yesterday. He is at present engaged in putting up a 20-stamp quartz mill, near Diamond creek, for the Celia Mining Company, an Eastern organization, and expects to complete the job in the next sixty days. He says everything indicates a big quartz boom in Washington township.

DOWN FROM THE DAM.—Nevada *Transcript*, April 22: Dan A. Rich, who has charge of the celebrated Fordyce Dam, the property of the South Yuba Canal Company, whose principal office is in this city, arrived in town yesterday. The dam, which is the largest on the Coast, is full of water, and the snow on the north side of Red mountain is three and a half feet deep. The probabilities are that the water season will be short, on account of so little snow in that section.

ROCKY BAR MINE.—Grass Valley *Union*, April 25: There are now about 30 tributers at work in the Rocky Bar mine, a portion of the force being at work on the south pitch of the ledge, intending to work it through the Kelly shaft, which has been in disuse for some years. This shaft has been put in repairs, and a hoisting engine is being put over it. The workings at the bottom of this shaft have been drained by the pumping out of the water in the North Star mine, which will be an advantage in expediting the work of the tributers.

WASHINGTON TOWNSHIP MINES.—Grass Valley *Union*, April 26: The Yuba mine in Washington Township has now a large ledge of a good quality of ore, and it is said the company design increasing their milling facilities by adding ten more stamps to their mill, which will make in all 25 stamps. The capacity of the 10-stamp mill of the Eagle Bird mine is also to be increased by the addition of 10 more stamps. The mills of both of these companies are run by water-power. The Lindsey mine is said to be looking very well. These mines have large bodies of low-grade ore which can be milled at a profit owing to the use of cheap water-power.

NOTES.—*Tidings*, April 25: M. Gauthier is going to erect 5 stamps on the Crown Point. The 14-level in the Idaho is looking very well. The other levels contain but average milling ore. The Empire still continues good, so good, in fact, that the owners are going to add 30 stamps to the already 20. This is a good showing for the oldest worked mine in northern California. The custom mills are running regularly upon ore from prospect shafts. The owners of the custom mills say that they have been running more regularly for the past few months than ever before at this time of the year. The North Star company have made arrangements to crush rock at the Rocky Bar mill and commenced Tuesday. There are now about 100 loads extracted from different levels of the mine by the tributers. The rock shows well in free gold and sulphurets. The resident trustees (or directors) took a trip through the New York Hill mine on Tuesday, and we learn from Mr. Peter Johnston, one of the directors, that the mine now looks better than it has for the past two years. The miners are stoping above the 10-level, and are sinking a winze and breasting in the 13-level. The prospects are particularly encouraging, for there is pay rock now in sight that will run the mill for two years.

THE BONANZA DISTRICT.—Nevada *Transcript*, April 20: Mr. Baker has bonded one of his ledges, called the German, to a San Francisco company for $10,000, payable in one year from the time the agreement was entered into. Work was to be commenced on the mine within thirty days after the bond was signed and delivered. This property is located just below the mouth of Diamond creek, on the south side of the river. It is supposed to be a continuation, running south of the Canyon Creek mine, now owned by Geo. G. Allan, of Nevada City. The Rodda boys, claimants of the Golden Gate ledge, have a very promising prospect lying a little east of the German. They have a shaft down on the ledge, which is a vein of from 7 to 8 feet wide, and all of a good character of rock. The next mine of any importance lying to the east is called the Bluejay, and is owned principally by Blue Tent parties. They have a tunnel in on the ledge over 100 feet carrying a fair-sized vein most of the distance, all good looking rock, showing free gold in many places. They have a contract which calls for another 100 feet of tunnel, which, it is thought, will thoroughly prospect the ledge. Farther up the hill, just below and to the west of Lindsay mine, is a ledge called the Live Oak. It is owned by Mr. Thomas Maloney, of Washington, and the Baugh Bros. They have a vein about 5 feet wide, well defined, and which shows free gold from the croppings down. It dips to the east and runs a few points to the west of north, as all true veins do in this district. The Co. at the Cornucopia and Secret Treasure have started a drift from the bottom of their shaft running north into the hill. As soon as 50 feet is reached sinking the main incline will be resumed. At the Yuba mine their main shaft is down 280 feet. The ledge on the 200-foot level in some places is 14 feet wide, and the rock shows very rich in free gold and galena. Forty tons of ore per day is put through the mill with only fifteen stamps, and the general average of the rock is not less than $8 per ton in free gold; no sulphurets being saved, although two Frue concentrators stand idle in the mill. Their pay at the present time is all in free gold, the company not making any effort whatever to save anything else. The Yuba mine is considered by miners up here to be equally as valuable a property as the celebrated Eagle Bird is to-day. The company at the Geo. Norton mine have a tunnel in on their ledge about 100 feet, carrying a vein varying in size from 2 to 4 feet, and all good milling ore, though at one end of the tunnel the vein is small but the ledge formation is uniform in width, walls, well defined and regular. At the Blue Bell and Sunset mines the manager intends to resume sinking on one or both shafts the coming week. This property seems to be the most attractive to capitalists of any here, on account of situation and conveniences, as well as being an old location and undisputable title. There is ample water-power the year round for all milling and mining purposes within 700 feet of the mine. Taken altogether it is a most desirable property to invest in.

Placer.

IOWA HILL.—Placer *Herald*, April 25: J. J. Rich, of Iowa Hill, was in Auburn last Thursday. He reports the Hill as lively and full of people, many being there from below, some seeking investments, and others on prospecting expeditions. The drift mines of that divide it is conceded have only as yet been touched. Capital alone is needed to open up some immense deposits, and this, it seems, is being attracted in that direction. The Mountain Gate mine at Damascus sent down to the Hill a few days ago 316 ounces of gold as the result of the last month's run with a force of from 15 to 20 men.

A BIG DEVELOPMENT IN A LITTLE MINE.—At times there has been a good deal said about Holden & Smith's little mine out near the Chinese graveyard. Their first find was a very narrow vein, but exceedingly rich. Several shafts developed that the rich chute was rather extensive. They worked along leisurely at taking out the rock, sometimes not procuring any more during the day than they could crush in a hand mortar at night, and yet, at this rate, the rock was so rich that they realized sometimes from $200 to $300 a day. They have been bothered with surface water from the start, and to overcome this they put up some time ago a small overshot water-wheel as a motive power for pumping out the water. By this means they have been able to go down. They followed the small vein into the bowels of the earth, satisfied with what it contained, but the other day, when at a depth of about fifty feet on the incline, they were happily surprised to find coming in from under what they had regarded as the foot-wall, a well-defined ledge of hard quartz, about eight inches thick and as rich, almost, as their little vein had been. This development proves that heretofore their operations have been confined to mere stringers, and now, with the discovery of the main ledge, they have a mine, and one which, judging from the richness of so much as is exposed, is likely to make the lucky owners rich, and have a favorable effect on the community.

San Bernardino.

SILVER ODESSA.—Calico *Print*, April 26: Last Tuesday we took a stroll through the drifts of the Silver Odessa mine in company with Major Geo. P. Gillis, the general manager, and Geo. Desallier, the tons. The chute connecting the bin with the ore house above is over 300 ft. long and almost finished. The ore house is a substantial structure 44 ft. long, where 20 men can conveniently assort ore. Seven large screens have been constructed for separating the ore. A car track 600 ft. long winds around the ridge on the west from the ore house to the main tunnel. Below the car track on the west and south there is abundant room for a waste dump, which could not be obtained on the east side of the mine. The old chute at the north-east end of the mine will be used for elevating supplies and material. The main tunnel that opens at the south end and extends northward through a broad ore zone, is over 360 ft. long. At intervals drifts have been run off from the tunnel, some of which penetrate ore and others are prospecting with good indications. The main tunnel, or spar drift, as it is called, follows the foot wall of a ledge which dips west into the hill, but the hanging wall has not yet been determined. Sometimes the pay streak is a foot or two in width, exceedingly rich, and then it widens into a large chimney of ore, permeated with born silver and chlorides. These chimneys are frequently 15 to 20 ft. in width, and have not been exhausted, stoping still progressing. The ore extracted from them is not assorted but is taken to the mill in the condition it comes from the mine. The ore breaks up and pulverizes easily, and the mineral in the chimneys exists in the innumerable seams that ramify through the ledge matter. Only a small percentage of mineral may be found in the chunks of this character of rock, but their surface is thickly coated with chloride and horn silver, a great deal of which falls off and is saved in the screenings. The ore also is found in narrow streaks of almost solid mineral. Some of the cavities formed in taking out the ore are very large, which have yielded hundreds of tons of ore each. The old tunnel, commencing near the old chute on the east side, is in over 200 ft., is 20 ft. above the main tunnel with which it connects, and is being extended in a westerly direction as rapidly as possible, cross cutting the main ledge. Drifting from this tunnel is progressing in several places, which are showing up well. A tunnel has been started from the south-east end of the mine for the purpose of intersecting the ledge some distance below the other openings which is in about 150 ft. and about to penetrate the ledge. The main spar ledge can be traced across the canyon 350 ft. below the upper tunnel. From 12 to 25 tons a day are taken from this mine to the company's mill at Hawley's station which gives an average of $80 to $120 to the ton. At least 100 tests of the ore each day are made at the mine as fast as new ground is broken, besides the samples that are assayed at the mill, consequently no unnecessary work is done, and the mine is worked systematically and with great profit. There are 40 men at work, but the number is not likely to be increased very soon, as the mill is now crowded to its utmost capacity with ore.

Shasta.

GOLD AND SILVER.—Shasta *Democrat*: About half the crew at the Silver King mine was discharged last week. We hear it stated that Wm. T. Coleman is negotiating for the purchase of several quartz mines near Shasta. We are informed that there are three or four San Francisco men on Squaw creek negotiating for mining property. The best ore that has yet been found in the Silver King is at the bottom of the 70-foot shaft. It assays up in the hundreds. We hear that Harry Burke, lately struck a rich prospect on the divide between French gulch and Deadwood. Dale & Fife have suspended taking out ore in the Silver King for the present, but the pumps are kept at work to keep the mine clear of water. We learn that the mine in Star gulch in which Ed. Reid and others are interested, prospects most encouragingly and is continually becoming better. Three prospecting parties equipped with pack animals and two months' provisions started for the mountains last Saturday. They were strangers from abroad. The Winthrop Mining Company started up its mill last Thursday, and the whole machinery works like a charm. The company is burning brick for another furnace. Dan O'Neal informs us that two Calico prospectors last week struck a rich gold quartz prospect on the second extension south of the Florida, between Star gulch and Quartz hill. We learn that a good-sized vein of coal was recently discovered in Clendenin creek in the Tamarack country east of Millville. It is said to be of good quality and makes good forge fuel. A. gentleman from Chico by the name of Mathewson last week purchased three quartz claims from Mrs. Myers, of Lower Springs. The claims are situated between Lower Springs and Salt creek. Monday we met Jewett of the Seamen's mine near Churntown. He says his company is still developing the mine uninterrupted by any mishaps, and the ore crush yields a fair profit. John Price, of Centerville tells us the winter has been a poor one for the placer miners around Centerville and Texas Springs. They have had an unprofitable winter's run on account of the scarcity of water. Monday at the express office we saw 45 pounds of amalgam from the McDonald Brothers' mine at Deadwood—a clean-up from a nine days' run. At $16 to the ounce this little chunk of amalgam is worth $8,640. Since the Mad Ox mine at Whiskytown has closed down there has not been much interest taken in mining matters around that burg. Those acquainted with the history of the Mad Ox are confident it is a good mine and would develop into fine property if properly handled. Windy Camp and Squaw Creek are just now attracting quite a number of prospectors and gentlemen seeking mining investments. The new gold quartz "finds" seemed to have caused the craze, and there are good prospects for Squaw Creek to become a lively camp this summer. A company of five of Redding's citizens secured an extension to the Whitton & Small mine on Squaw creek, which prospects "way up." A quantity of rock brought down a few days ago is literally peppered with coarse gold. If the vein-matter will average within 50 per cent as good as this sample it is a rich thing. S. Weil informs us that Mike Shay and A. C. Ellis recently struck a new and very rich shoot of silver ore on the Windy Camp mine on Squaw creek. The company owning the group of Windy Camp mines contemplate building a wagon road from the mines to the railroad, with the view of shipping ore to the Selby Smelting works at Port Costa. An acquaintance writes us from Lewiston that that beautiful mountain burg is all life and bustle, made by the boom in the mines around it. The Vermont mine, owned by H. E.

superintendent. The new ore bin at the south end of the mine is completed and has a capacity of 140 Willey, under the able superintendency of Joe Falon, is proving to be excellent property. The lead is from three to six feet wide, and the ore is now prospecting better than ever.

NEW DISCOVERY.—Red Bluff *Sentinel:* Major Kimball and Will Lunning returned last evening from the Bald Hill country, where they have been for several days surveying the outside lines of the Major's stock ranch, preparatory to fencing the entire tract. While surveying they ran across a quartz ledge and knocked off some rock, which they brought with them to be examined by experts and possibly sent to San Francisco to be assayed. For outside surface rock it looks very good, and in fact, native silver can be detected with the naked eye. The rock looks like the best croppings that comes from the Bully Choop mines.

Sierra.

SAVAGE MINE.—*Mountain-Messenger*, April 25: Judge Davidson and Robert Forbes went up to the Savage mine Thursday. The property at the mine was sold at sheriff's sale some time ago, and bid in by Mr. Dows, the party holding the attachment. He has been sinking on the channel discovered by the Savage company. This channel is narrow and no gravel has yet been found in it. It is thought to be a continuation of the Lilyput channel, which is opened about half a mile above. This is a singular channel in that it carries no gravel, although rich in gold. It is proposed to bottom the Savage channel, the shaft being now down about 25 feet. Mr. Gardner, of the Belmont Consolidated quartz mine, was over the first of the week from Poker Flat, for the rest of quartz mill which he is erecting. It will be in working order very soon, and the ledge will then give a good account of itself. A nugget, valued at about $400, was found in the Bald Mountain, Forest City, last week.

Trinity.

NEW RIVER.—Cor. Trinity *Journal*, April 28: Our camp gets ahead slowly, but sure. In my next I hope to chronicle some large sales, as there are good indications that San Francisco men will take hold. Just what is wanted is capital. The Development Company has sent a new superintendent in the person of Mr. J. M. McCormick, a man of experience, good miner, energetic and go ahead; attends to his own business; the whole camp says we have got the very man who is needed to fill the bill. Every day new discoveries are made in the mountains. Prospectors have brought in good rock from Plummer, Methodist and Know Nothing creeks, in each of which the placer mines were very rich.

DEADWOOD.—Trinity *Journal*, April 25: Deadwood is entitled to be be called the Bonanza district, for it is indeed the richest and most extensive quartz mining section on the Pacific Slope. So frequent are the good reports from that section that it appears like repetition to publish them week after week. A few days ago McDonald & Franck made a clean-up after 13 days run with their 5-stamp mill, and took out $10,000, to say nothing of the large body of rich sulphurets saved by the two Frue Concentrators. At the Monte Cristo mine, leased by Van Matre & Ramm, they are taking out some extraordinary rich rock, as we are assured that every piece on the dump shows free gold and most of it a great deal. A piece handed us by Henry Martin has been reserved for a place in the new cabinet, and we hope to be favored with many more from the mines of this rich district in the near future.

Tuolumne.

IMPROVEMENTS.—Tuolumne *Independent*, April 20: Messrs. White, Bacon & Co. are pushing the Divoll Bonanza mine. The tunnel has been completed to the old shaft, and will be used as a ventilator. Pumps will be put in and hoisting works erected. Wood contracts for the engine have been made, and every arrangement completed to go after the second edition of prosperity in this famed property. It may be that several new deposits have been formed since the old company quit, and it is also intended to capture these as well as the old mines.

SUMMERVILLE.—The Buchanan mine has been working steadily for three years or more, during which time they have uncovered several valuable chutes of ore. The Co. that own this mine has proved to be one of the best that ever operated in this county. They are just completing a large boarding and lodging house. It is rumored that they intend building a saw-mill some time during the coming summer.

QUARTZ.—Tetters has struck a quartz lead somewhere near the old Excelsior, above Sugar Pine. It is rumored that it is a good prospect, and that the rock shows considerable gold. Messrs. James Trevithick and Harry Adams were on a visit to Strawberry during the week. Mr. T. informs us that the Green Mine Company intends commencing work on their mine the 1st of May. Active work has been commenced on the Manzanita mine, near Soulsbyville, owned by James Pooley and Capt. R. Bolter. They are sinking a shaft. The Hyde mine started up the first of the week, a crew of men having been employed from Amador county. Tenders were received at the mine a short time ago to sink the shaft. Several men from Soulsbyville tendered for it, but the superintendent thinking the prices too high, rejected all the bids, and sent to Amador for men.

AT WORK.—Work is being vigorously prosecuted on the Argentum mine, by Dr. E. T. Wright, of Washington, D. C. A tunnel is being run according to survey made in 1864, which will tap the vein at a considerable depth, giving an abundance of stoping room. Dr. W. is a gentleman of energy and means, and that his efforts may be crowned with success, is our earnest wish. Joaquin Deluke, better known as Nervi, has a mine which promises to be something good. A lot of $8 rock was crushed sometime since, and, to the agreeable surprise of the owner, milled him $25 per ton. We have been credibly informed that Messrs. Jake Biddle & Co. have uncovered a $1,700 pocket at French Camp, above Pine Log. Hastings & McKenna have brought to light a small bunch of "filthy lucre," amounting to nine pounds. These insignificant strikes, together with those made on Bald mountain, go to prove that the "woods are full of 'em."

COLUMBIA.—The industrious miners are hard at work, delving among the boulders and on the hillsides, and adding, by their labor and its results, so much weekly to the general circulation, and giving an impetus to trade that very few other occupations can equal. It is said that Wright & Co., who have bonded the Argentum mine, north of Columbia, have struck a large body of good milling rock, some of which they are now crushing. T. C. Birney and R. Ham have, after a considerable time, labor and expense, completed a new and improved arastra on their mine, to the north-east of town. It works very well, and is running day and night. It is rumored that the Riverside and Sonnet mines are to suspend working for awhile. If so, it is to be hoped they will resume shortly. Dave Levy is still sinking in his "Old Tuolumne" mine. It is reported that the Oakland Mining Company will soon put up new hoisting works, preparatory to putting the mine in active operation. Capt. Griffin has the richest diggings we have ever seen. The claim is situated on the south side of Main gulch, near the end of Maiden lane. He has opened out a very rich streak of gravel, that will prospect from five cents to twenty-five dollars a pan. This is no exaggeration, but an actual fact, as many who have seen the dirt prospected will attest.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, April 26: On the 2,900 level, cross-cut No. 4 last evening was being steadily advanced to the westward and northward in the ore vein, and there was no falling off in the character of the ore. On the contrary, better average assays were obtained from the face, and the whole exhibited a permanent, even appearance, such as characterizes any regular ore vein formation. If its course is north, as seems to be indicated, the cross-cut, passing through it diagonally in a north-westerly direction, must soon reach its west side, unless it is wider than yet known or calculated upon. On the 3,000 level, the lateral drift south from cross-cut No. 2, in the ore vein, has been temporarily discontinued, in order to give the corresponding lateral drift north, on the other side of the cross-cut, a fair start. The second round of holes was blasted out last evening, and the drift found to be all in a solid mass of good ore. The intention now is to push this north drift ahead, in order to test the course and character of the vein in that direction, in conjunction with the northward work in the level above.

CONSOLIDATED CALIFORNIA AND VIRGINIA.—The drift running south-west into the Con. California and Virginia mine from the south line of the Ophir ground on the 1,300 level has been advanced 64 ft. On the 1,750 level we have started two upraises, one west of No. 6 stope and one south of No. 6 stope. The southwest drift on this level has cut east cross-cut No. 2 in the old workings, and we are now reopening that cross-cut. We have hoisted 589 tons of waste and extracted 57 tons of ore; the average assay value of the same, as per samples taken from 62 mine cars, is $39.12 per ton. We have shipped to the Morgan mill 367 tons 625 pounds; the average assay value of the same, as per samples taken from the railroad cars, is $28.50 per ton. Ore extracted under the Jones contract, 465 tons, the average assay value of which, as per samples taken from 503 mine cars, is $25.44 per ton. Shipped to the Eureka mill under this contract 588 tons and 1,070 pounds, the average assay value of the same, as per samples taken from the railroad cars, being $27.69 per ton.

BEST AND BELCHER.—On the 100 level a northeast drift has been extended 20 feet. This drift starts from the north lateral drift at a point 100 ft. south of the face.

OPHIR.—Having been easing timbers in the west drift on the 500 level. Hoisted 197 tons of waste for the Consolidated-California and Virginia, working through the south drift on the 1,500 level.

UNION CONSOLIDATED AND MEXICAN.—The joint Union and Mexican drift, running north on the 500 level, has been extended 61 ft.

SIERRA NEVADA.—The north lateral drift on the 520 level has been extended 47 ft.

Columbus District.

MOUNT DIABLO.—*True Fissure*, April 25: The west drift from the sixth level has been driven 12 feet during the week, and the face shows ledge matter giving low assays. The west drift on the fifth level has been stopped, and a north cross-cut has been started from the same. The winze to connect with the sixth level is down 48 feet, and shows a small streak of $80 ore. The stope above the west drift on the fifth level is looking well and giving considerable $50 ore. The intermediate stope, between the fourth and fifth levels, is giving some $80 ore. The intermediates, between the first and second levels, are giving some ore of good grade. A bullion shipment of $14,751.74 was made April 23d.

Galena District.

THE GALENA MINES.—Nevada State *Journal*, April 25: The prospects for a lively camp at Galena this summer are said to be good. The district, when organized by Judge McBeth, its discoverer, was in Humboldt county, though subsequently ceded to Lander. The *Central Nevadan* says there are some five or six mines in the district that are producing an average of three tons of ore daily which assays from $100 to $300 to the ton. The machinery for the new mill under course of construction by B. F. Wilson arrived last week, and will be speedily put in place, and when completed, the mine owners will be able to get their ore reduced at home, which will be a great convenience, as well as a saving of money. Mr. Wilson has stayed with the camp for many years, striving to develop the rich mines that he knew existed there, and he is now reaping his reward for his persevering labors, for it is an assured fact that there are mines in Galena that will pay to work.

Garfield District.

SHIPPING BULLION.—Candelaria *True Fissure*, April 20: Without any flaunting of colors or noise about what is being done, the little 5-stamp mill owned by Farrington Brothers situated in Garfield district, continues to ship bullion constantly, steadily and in goodly amounts. Two shipments per week are the average and each is valued at from $6,000 to $8,000. This would bring the month's total shipments up to between $50,000 and $60,000. About 14 men are employed in and about the mill and a few more than that number in the mine. The negotiations, which have been pending for the sale of this, the Great Western, property to an English Company, are still in progress and it is expected the first payment will be made on the first of next month. The product from this mine sends Esmeralda's contribution of bullion up among the big figures, and this fact is attracting attention to many other fine properties in the county.

Mount Cory District.

DULL.—Walker Lake *Bulletin*, April 22: It looks a little dismal, and the population is slim, but there are some here who came to stay, and it will not be long before the camp will again be a booming. It is the opinion of a great many mining men, that the Cory mine is a break from the big mountian, and the main ore body lies to the south.

Rebel Creek District.

THE OHIO MINE.—*Silver State*, April 22: We learn from F. P. Snapp that a vein of rich gold-bearing quartz has been cut in one of the drifts in the Ohio mine at Rebel Creek. The mine hitherto has been producing silver ore exclusively. The extent of the new find is not yet known.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, April 24: North drift, 150-foot level, extended 11 feet; total length, 163 feet.

INDEPENDENCE.—Fair progress made with the work at all points. No material change to report.

BELLE ISLE.—Drift north from east cross-cut, 400-foot level, advanced 11 feet; total length, 40 feet. Drift north from west cross-cut, 250-foot level, extended 6 feet.

NAVAJO.—Drifts and cross-cut on the 650-foot level, has been extended the past week 64 feet. South drift and east cross-cut on the 350-foot level, advanced 52 feet. Work suspended in No. 1 winze at the depth of 200 feet. Fair progress has been made in No. 2 cross-cut east. South drift on the east vein, advanced five feet. No. 2 upraise on the east vein, carried up five feet.

ARIZONA.

STERLING, Prescott *Courier*, April 29—The Sterling mine, at a depth of over 100 ft., is over 11 ft. wide. Good judges say it will pay over $20 per ton in free gold and that the sulphurets, which will be concentrated, are very rich. S. C. Miller's teams are on the way to Prescott with a mill for the Sterling. Mr. Dawes, of the Peck, is again in Prescott. He is satisfied with results of the tailings he is working; brought in some gold a couple of days ago, and will shortly bring in a great deal more. Mr. J. H. Brown, who has just returned from the Conger mill and Verde valley, tells us that the mill will start crushing Conger rock in a short time. Bush Bros., who are managing mill and mines, are good business men and will, Mr. Brown believes, achieve success. Twenty tons of ore from the Bullwhacker have just been worked at the mill on Lynx creek, and Mr. Brown, who was there when a clean-up was made, is satisfied that the rock paid $50 a ton in free gold. The owner of the Ethel mine, Hassayampa district, George A. Allen, who recently bought an interest, and R. W. C. Merrington, contemplate making a shipment of high-grade ore to Pueblo for reduction at an early date, the recent developments having made the owners feel pretty good.

BRADSHAW DISTRICT, Prescott *Courier*, April 25: Bond & Hayden have completed a water-wheel for Bill Bell, who is running arastras on East Humbug creek. Five men are taking black sulphuret ore from the Tiger mine; ore is worth about $200 a ton. Men are working near the old shaft. Charley Taylor is taking rich silver ore out of his Oak Flat mine. Bond & Hayden are preparing to hoist ore out of their own mine. E. S. Junior has a great many tons of high-grade ore on the dump. Gold rock (sulphurets) from a claim on the Oro Bonito ledge is roasted, and pays well in arastras.

TURKEY CREEK.—Mr. J. W. Wilson, a Prescott assayer, and Under Sheriff M. A. Lawler have just returned from a visit to the Mulvenon & Roach mine. They have pieces of ore which are very rich in silver. In it we noticed a great deal of black sulphurets, with some wealthy galena. Seven or eight tons of this staff will soon be shipped to a Colorado smelter. County Treasurer Cook and Mr. Moreland returned to Prescott yesterday from Humbug district. Mr. M. tells us that the mill is running, chloriders taking out rich ore and everybody pleased with results. The Crosscut mine is developing into a fine property.

PINE GROVE DISTRICT.—Messrs. Robbins and Gobin, lessees of the Del Pasco mine and mill, have very rich free gold quartz in a new shaft on the vein.

PECK DISTRICT.—Peck tailings are now run through raw, as we may say. The expense of roasting is saved, and the work of getting the silver out of the tailings is said to be very profitable.

COLORADO.

CRESTED BUTTE.—*Pilot*, April 23: There is no more desirable place in the country for ore reduction works than the Crested Butte. It is often the wonder of strangers that works have not been built here before, as the advantages here are much greater than other points. With all kinds of coal mined on the ground, as well as the coke being burned here, and with the superior water and timber advantages, certainly an ore reduction enterprise ought to pay. We believe the mines are far enough developed to supply ore enough for the demand, and by the erection of works it would give encouragement to develop mines that have hitherto been idle. It is reported that the owners of the Belle of Titusville will pay the forfeit money of $500 and take the mine back. It appears that Chas. H. Schue & Co. have got a working bond and lease on the property, with an agreement of some kind that the owners can take the mine back by paying the forfeit of $500. The property has proved to be so good on development that the owners have concluded to keep it. The sinking of the shafts and starting new drifts at lower levels on the Augusta, is proving that her ore bodies are immense, and that the richness of the mineral is steadily increasing with depth. Reports of recent assays of ore taken from the drift just started at the bottom of the deep shaft give returns of 256 oz. silver and 9 oz. gold per ton. This sample was supposed to be a fair average of the first class, which is now coming out in very large quantities. There is little or no waste rock, as the drift is entirely in mineral, and even the screenings give a value of 10 oz. in silver and $30 in gold. The boys on the Big Strike report a fine body of ore now coming in. The boys on the Hawkeye report the vein still improving and the face of the tunnel nearly all ore. No mill tests have been made recently, but assays give the value of first-class to be about $500 per ton. It is thought that the whole product of the tunnel will pay to mill should the company build a concentrator in the vicinity of the mine, or at Pittsburg.

IDAHO.

A PROPOSED MINE-OWNERS CONVENTION.—Wood River *Times*, April 25: During the past two or three weeks it has been evident that some steps were being taken by the mine-owners looking to some sort of an organization between them to conteract the organized action of the Miners' Union men and for other purposes; but exactly what would be done in the premises was not known. A well-informed business man who claims to know, however, informed a *Times* reporter this morning that the preliminary steps have been taken for a conference of the mine mine-owners of Alturas county, to be held in Hailey on or about the first of May, with the view of arriving at some understanding regarding their future course, not only concerning wages, but concerning rates of freight and charges for sampling, reducing and selling the Alturas ores and their yield. Several of the mine superintendents have already signified their willingness to take part in such a convention, and favorable responses are looked for from Rocky Bar and Atlanta. The convention will, therefore, doubtless be held.

MONTANA.

MARYSVILLE.—Helena *Independent*, April 22: The great complaint in this section, like every place else, is the dullness of times. Yet what is being done appears to be prosperous. About the Drum Lummon everything is running smoothly, bullion shipments being large and regular. Cotter & Hickey's mines and mill at Mount Pleasant have commenced the summer's operations. Mr. P. H. Shannon, the owner of the Sanford mine at Mount Pleasant, has recently bought the Emma Miller, arastra and mill site, between this place and Belmont. It is supposed that Mr. Shannon will erect a mill on this site which, by the way, is the finest location for a custom mill on the creek, and accessible from all mines. Should custom work be done here it would give this district its greatest boom, and show its real value. The Nine Hour lode, after having been proved to be a real bonanza, is now lying idle. Rogers & Curren have struck a small but very rich vein on Cruse Hill, almost in the town, and are getting quite a pile of rich quartz on the dump. At Bald Butte a number of parties have been extracting very high-grade gold quartz from the Doc Parker, Griff and other lodes. A mill will be built there this season for working this quartz.

THE MISSOURI LODE.—A fine prospect was discovered recently within one mile of Wickes by W. J. Dunn, Wm. Nelson and Wm. Hoback. At a depth of 12 feet the vein opened out to 14 inches of fine galena of good ore. The find created considerable excitement in the camp, which was supposed to have been thoroughly prospected years ago, and, previous to the storm now prevailing, picks and shovels were in great demand, and the hills were dotted with prospectors anxious to equal, if not surpass, "The Missouri"—the name of the new lead.

NEW MEXICO.

GOLD HILL.—Cor. Silver City *Enterprise*, April 24: McLane, Rodgers & Hart have just finished a tunnel on the Standard mine owned by them, tapping the lead 150 feet below the surface, and the showing is very handsome. This seems to prove the leads to that depth. McCone & Keister have struck a new claim. Giddings & Miller shipped 1,000 pounds of ore to Silver to have it sampled. George Goodwin shipped four tons of ore netting, as we understand $185.50 per ton. Winter's new strike blisters handsomer than any rock we have ever seen. New strikes are daily reported in camp, and all claims are looking fine. At any depth the leads are strong and free metal is common. H. H. Bell, we understand, has made a very rich strike. We understand that a stamp mill or smelter will be put up at Lordsburg, or that they are under process of erection at that point to treat Gold Hill and Malone ores. Many who have rich ores are waiting, as they can afford to do, for machinery to arrive in camp, so rumors reach us,

UTAH.

REVIEW.—Salt Lake *Tribune*, April 27: The week has averaged stormy, with one of the worst snows of the year. Yet the movement of the metals was fair. The receipts of bullion and ore in this city for the week ending April 22d, inclusive, were $78,095.07 of bullion, and $12,800 of ore; a total of $90,895.07. For the previous week the receipts were $64,841.85 in aggregate, of which $58,070.38 was bullion and $6,771.47 ore. The shipments of the Ontario for the week were 68 bars, of the value of $42,841.24; bringing the total output of that great property for 1885 to date, up to $551,105.85. As announced several days ago, the Ontario will be shut down in May for a clean-up, after a twelve months' successful and continuous run. There is nothing new from the Horn Silver. Mine and smelters are practically at a stand-still. Sales of this stock in New York for the week ending April 17th amounted to 3,300 shares at prices following: April 11, $2.35; 13, $2.40@2.50; 14. $2.45; 15, $2.40;@2.45; 16, no quotations; 17, $2.20@2.40. Receipts from Silver Reef for the week aggregated $7,166 in silver bars, of which the Stormont sent three, valued at $4,050, and the Christy two, valued at $3,116. The Vienna sent down from the Sawtooth one bar of bullion, valued at $1,920. The product of the Hanauer smelter for the week was eight cars of bullion, $20,110. The Germania's first report after starting up was two cars of bullion, $4,557.83. Ore receipts were $4,450 from the Honerine; $2,000 from the Crescent, both fo Utah; and $3,950 from the Queen of the Hills; $1,100 from the Minnie Moore; and $1,300 from the Eureka, all of Wood River,

HERCULES SLAYING THE GIANT.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

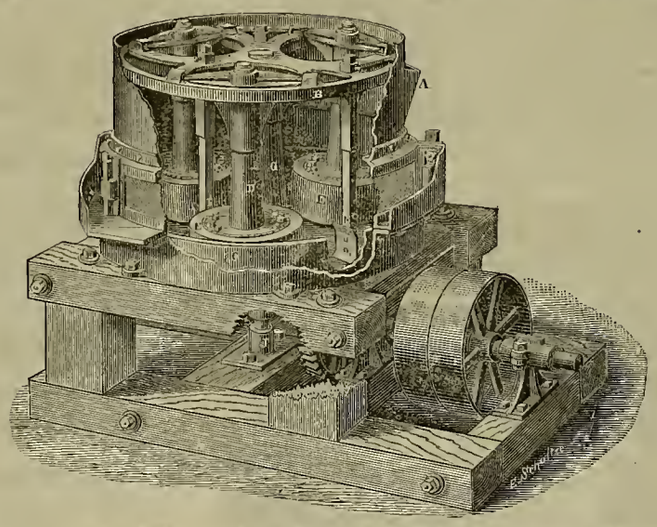
F. A. HUNTINGTON'S
CENTRIFUGAL ROLLER QUARTZ MILL.



Ecomony in Expense of Plant. Economy in Cost of Working. Economy in Saving Gold. Economy in Transportation of Machinery. Economy in Cost of Erection of Mill at Mine. Economy in Time Required to Establish Plant (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of continuous use at a number of mines in California has enahled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached THE ABSOLUTE in the construction of a perfect Quartz Mill.

ROCK BREAKERS, CONCENTRATORS

221 & 223 First St, cor. Tehama, S. F.
J. W. QUICK, Prop'r.
Sheet Metals of all kinds perforated for Flour and Rice Mills, Grain and Malt Driers, Furnaces, Chess, Cement and Smut Mills, Separators, Revolving and Shot Screens, Stamp Batteries, and all kinds of Mining and Milling Machinery. Inventor and manufacturer of the Celebrated Slot Cut and Slot Punched Screens Mining Screens a Specialty, from No. 1 to 15 (fine).
Orders Promptly Executed.

Metallurgy and Ores.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
Assayers' Materials
MINE AND MILL SUPPLIES,
CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.
114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we ee confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.
Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

A Glance over the Mining Field.

The 16 mile ditch into Osceola, Nevada, has been completed and the water turned on. A large reservoir is next to he constructed. It will he soms little time before the first clean-up from the gravel tanks will he made.

Rathberg, Idaho, has shown some strikes recently that greatly brighten the future of that camp, aud indications point to it as one of great possibilities.

The leaching process seems to have revived the fortunes of the old camp at Marietta, Nevada. The mill has been idle a long time, owing to the refractory nature of the ores. Now, however, a shipment of bullion has been made. The copper the ore is removed hy leaching. New tanks e heing put up and business has revived.

Barber's mill, at Calico, has been running continually and successfully for some time on custom ore. It is one of the most complete and best arranged silver mills on the Coast of its size. Arrangements are heing made for enlarging its capacity.

The output of hullion from the Copper Queen, Arizona, has somewhat decreased. The lawsuit heretofore pending hetween the Queen and Prince mines has heen decided, but still a suit for damages hangs over the Queen.

Parties around Bannack, Moutana, are anxiously waiting for the snow to go off in the Elk Horn country, when a stampede will set in, as rich ore is known to he there.

Angels Camp, Calaveras county, one of the old-time districts, looks forward to renewed activity.

An 8-stamp mill is soon to be srected on the Cherokee mine, uear Altaville, in this State.

If the chloridization test at present being made at the Howell roaster at Bullionville, Nevada, proves a success, the leaching company will erect the large Stedefelt furnace right away.

In Plumas county, there are plenty of rich ledges, but capital has heen slow to come in thers, partly owning to ths location of the county, whioh is almost inaccsssible in winter.

The grading of the site of the new smelter hy the Copper Prince Company, Arizona, is nearly completed.

Small quantities of copper have heen received recently from Japan, and it is expected that large shipments of it will soon be made from that country. It is to bs hoped not, as we can produce more than ws want in this country, and want all the foreign markets we can get in which to dispose of our product.

The new mill at Copper City, in Shasta county, has started on its first regular run. The different mines in the district can now he properly tested.

The Calumet and Hecla copper mine, Michigan, will increase the sizs of its skips and underground cars so that an increase of 10,000 tons more of rock per month will be made.

Ths Mount Cory mine, Nevada, of which much was expected, has been closed down. It is not now known when work will he resumed, but there is reason for hoping that the stoppage is but temporary, as the ledge is plainly marked, and hut little work may develop another large hody of ore. The Walker Lake *Bulletin* pertinently remarks: "It is the opinion of a great many mining men that the Mount Cory mine is a hreak from the big mountain, and that the main ore body lies to the south." In confirmation of this remark, it is a well-known fact that in the whole series of ore veins helonging to the Manhattan Mining Company, on Lander Hill, in Reese River district, such breaks are frequently met with, but hy drifting beyond the hreak a few yards or a hundred feet, more or less, the continuation of the vein downward is invariably found. This merely shows that the whole slope of the hill has settled or slid, hreaking and carryiug the viens with it.

The travel into the Cœur d'Alene mines has heen very heavy. There is already a surplus of miners and laborers, and the wage-worker who goes in now solely with the idea of procuring employment in the mines is likely to be disappointed.

Work is being pushed night and day on the Virginia Creek Hydranlic pipo line, in Mono county. The pipes will soon all be cemented, and a great deal of profitahle work will probably be done during the coming season.

About thirty-five men are now employed in the mines at North Star, Utah. Properties that have lain dormant for years are heing reopened. The outlook is very favorahls and the chances are that the old camp will resume its old-time activity.

Work on the new trail from Weaverville to New River is heing carried on with all possible dispatch, and will he completed at an early day. The Trinity *Journal* says: "Parties contemplating a trip to the mines should remember that there is less than forty miles of horse-hack travel this way, ths rest of the journey heing made hy rail to Redding and stage from there to Weaversville and North Fork.

New ledges are reported as found on Eastman gulch, Trinity county, hetween the Hickey and Blakemore mines, and another on Spring gulch, a tributary of Indian creek. Good prospects havs heen obtained in both instances.

The mining outlook for Montezuma and Snake River valley, Colorado, is hrighter than it has heen for the past two years. Nearly every mine that has heen worked during the winter has a large shipment of good ore ready for market when the road is opened. The miners are in excellent spirits.

Thc smelters at the Great Horn silver mine, in Utah, are practically at a stand-still.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco.

JOHNSON GRAVEL AND QUARTZ M. Co., April 25.—Capital stock, $1,000,000. Directors, G. K. Getchel, P. A. Wagner, H. W. Book, Wm. Duffenbacher and G. Withe.

FORT BRAGG R. R. Co., April 28.—The railroad is intended to run from the lide water at Fort Bragg Harbor, in Mendocino county, to the Noyo river head waters, in thal county, a distance of about 20 miles, and also a branch line to Ten Mile river. Directors, Otis B. Johnson, John C. Huggins, Charles R. Johnson, Calven Stewart, Charles E. Wilson and James Hunter. Capital stock, $200,000.

DORE PAINT Co., April 30.—Object, to manufacture paints. Capital stock, $1,000,000. Directors, H. E. Muller, H. W. Ball and W. B. Lake.

COMPASSES for pocket use. Muller, the leading optician depot, 135 Montgomery street, near Bush, opposite Occidental Hotel.

Our Agents.

OUR FRIENDS can do much in ald of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. G. KNOX—San Louis Obispo and Santa Barbara Co's.
GEO. MCDOWELL—Santa Clara and Santa Cruz Co's.
G. W. INGALLS—Arizona.
M. S. PRIME—Alameda County.
MRS. OZIER—California.
W. H. H. HUSSEY—Contra Costa County.
F. W. SMITH, New Mexico and Arizona.
W. B. TURNER, California.
R. E. BUSH—Shasta, Tehama and Trinity Cos.
M. C. BAKER—Napa and Yolo Cos.

IN THE United States last year there were manufactured 758,137,900 pounds of nails.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING APRIL 21, 1885.

316,107.—ROCK DRILL—C. O. Barlow, Nevada City, Cal.

316,106.—ROCK DRILL—Barlow & Emery, Nevada City, Cal.

316,116.—CONCENTRATOR—J. E. Clayton, Salt Lake City, U. T.

316,350.—SEWING MACHINE—Fisher & Hart, S. F.

316,256.—TRACE-BUCKLE—D. G. Gay, Pleasant Hill, Or.

316,141.—SOD-PULVERIZER—A. L. Gordon, Helix, Or.

316,035.—COAL-HOD—H. C. Hinman, Oakland, Cal.

316,049.—PUMP—Wm. C. McClay, Santa Ana, Cal.

316,164.—CULTIVATOR—S. A. Moulton, San Jose, Cal.

316,078.—WINDMILL—W. O. Swinnerton, San Jose, Cal.

316,315.—GATE—L. D. Wade, Puyallap, W. T.

4,428.—TRADE-MARK—D. F. Fryer, Oroville, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEWING MACHINE.—Alfred A. Fisher and Albert Hart. Brooklyn, N. Y. No. 316,350. Dated, April 21, 1885. These improvements consist in means, operated by the thread of ths machine, for throwing the power device out of gear with the sswing machine upon the passage of a knot in said thread, whereby the machins is automatically stopped.

WINDMILL.—Wm. O. Swinnerton. San Jose. No. 316,078. Dated, April 21, 1885. This improvement consists mainly in a peculiar device for throwing the wheel out of the wind, a supporting frame or tail hinged to ths main or wheel frams, and an arm connecting the wheel frame with the rotary vane. It further consists in a novel construction of the wheel and certain details of construction.

PUMP.—Wm. C. McClay, Santa Ana, Los Angeles county. No. 316,049. Dated April 21, 1885. This invention is in that class of pumps in which such an arrangement of several pumps is made that ths work of one has a tendency to relisvs that of the othsr hy reason of effecting a halance between them. The invention consists, primarily, in a pump having a stationery piston and a reciprocating oylinder provided with suitable valves and a discharge pipe; and it consists further of the arrangement of two pumps of this character in a manner which will enable one to halance the othsr, so that the power necessary for operating them is reduced to a minimum.

MACHINE ROCK DRILL.—Charlss O. Barlow, Nevada City, assignor of a portion to Geo. T. Emery and J. W. Sprague of same place and Richard H. Lane, of N. Y. No. 316,107. Dated April 21, 1885. The improvement is in that class of drills in which mechanism is employed to deliver a striking or percussion hlow. The improvement consists primarily in delivering the hlow directly upon the head of the drill-bit, and consequently a mechanism for holding the hit, receiving and controlling its rehound from the rock, and holding it to ths rock again, mechanism for rotating it and mechanism for delivering the hlow. It consists further in various devices hy which these results are accomplshed, and also in a device by which the frame or har carrying the drill and driving mechanism is detatched from the feed screw and adapted to he moved hack rapidly.

POWER ROCK DRILL.—Chas. O. Barlow and Geo. T. Emery, Nevada City, assignors of one-half interest to J. W. Sprague, of same place, and Richard H. Lane, of New York. No. 316,106. Dated April 21, 1885. The invention relates to the class of power rock drils in which a column supports a cross-har on which is suspended the body of the machine carrying ths drill, the hammer and meana for vihrating the hammer and rotating he drill. The improvements consists in a steam-engine as a source of power formed with and carried by the body-har of the machine, and connected with the driving shaft which operates the hammer; in a novel mechanism for vihrating the hammer, a pecubar drill and mechanism for operating it, and meana for introducing a continuous aupply near the hottom of the hole to wash out the pulp.

INSERTIBLE SAW TOOTH.—Nathan W. Spaulding, S. F., No. 315,853. Dated April 14, 1885. This improvement in insertihle sawteeth for circular saws in the employment of an independent removahle point or bit-holder, and is a novel metbod of securing these points firmly, and at the same time, so that thsy may he easily removed. The hit-holder ia formed like the hody of the tooth, this hit-holder heing

formed independently of the saw-plate, and having grooves which form V-shaped tongues or projections, into which it is inserted in the saw-plate, and wherein it is locked by any suitable device. The cutting-tooth or bit is formed in the manner similar to that patented by Mr. Spaulding, in 1883, and is locked or secured in the socket, which is made in the bit-holder, by means of a sliding key, which is grooved upon the back, so as to fit a corresponding tongue on the edge of the socket. The meeting edges of the bit and the sliding-key are also suitably tongued and grooved, so as to insure their being held in place without any chance of self-motion. In Mr. Spaulding's former patent the sliding-key was formed with a thin elastic extension at the rear end, having an upwardly turned point to engage with notches or serrations upon the back part of the socket extension of the bit-holder, so as to prevent the key slipping out while in use. In the present invention Mr. Spaulding has a key having an extension, which projects backward in line with the upper part and enters a narrow slot or extension of the bit-socket, which is formed directly in the rear of it. The rear part of the extension has a lug which projects downward so as to rest upon the bottom of the socket into which it passes, and thus leaves a narrow slot between the lug and the body of the sliding-key, which admits of a tool being introduced for the purpose of driving the key out when it is necessary to remove the bit. In order to retain the key in its place, a hold or slot is formed, one-half of which is made in the upper part of the extension of the key, and the other half or the upper part of the socket and corresponding with it, so that a transverse rivet or key may be driven into the hole there formed, thus locking the sliding-key securely in place. The key or rivet is of soft metal and sets in a countersunk hole when headed down. This rivet must be driven out before the key can be removed.

Bullion Shipments.

Lexington (Montana), April 25, $20,256; Zelia, 20, $1,568; Clark & Larabie, $4,880; Alice, 20, $16,120; Moulton, 22, $19,200; Alice, 23, $18,464; Clark & Larabie, 25, $332; Alice, 25, $18,464; Christy, 22, $1,426; Hanauer, 22, $5,110; Crescent, 22, 2,000; Queen of the Hills, 22, $1,350; Germania, 23, $4,551; Queen of the Hills, 23, $1,400; Hanauer, 23, $2,700; 24, $2,600; Queen of the Hills, 24, $1,300; Orlano, 25, $18,232; Christy, 25, $1,550; Vienna, 25, $1,950; Hanauer, 25, $2,500; Queen of the Hills, 25, $1,500; Vienna, 26, $3,770; Hanauer, 26, $2,400; Germania, 24, $1,967; 25, $2,129. The banks of Salt Lake City report the receipt for the week ending April 22d, inclusive, of $78,095.07 in bullion and $12,800 in ore, a total of $90,895 07.

Mining Share Market.

The market still remains rather active though prices have not been well sustained this week. The volume of business, however, is not large and there do not appear to be many "outsiders" interested. Should the hopes of the managers of the Hale and Norcross be fulfilled and a good body of ore struck, it is probable that an old-time excitement will result. The latest news from the Hale and Norcross is that west cross-cut No. 4 on the 2,900 level is still in good ore. On the 3,000 level they are now drifting north in ore of good quality.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Postpaid, $7.50. Printed and sold by Dewey & Co., S. F.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition, 1880), and the Extraction of their Respective Metals without Quicksilver. Illustrated. 150 pages. A valuable and carefully written work. Postpaid, $3. Sold by Dewey & Co., S. F.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by Dewey & Co., S. F.

PHILLIPS'S EXPLORERS' AND ASSAYERS' COMPANION (Third edition). Price of Vol. 1, postpaid, $6. Sold by Dewey & Co., S. F.

THE EXPLORERS', MINERS' AND METALLURGISTS' COMPANION, by J. S. Phillips, M. E., comprising a practical exposition of the Various Departments of Exploration, Mining, Engineering, Assaying and Metallurgy, containing 672 Pages and 83 Engravings. Price, bound in cloth, $10.50. Sold by Dewey & Co., S. F.

MINING, ENGINEERING, MECHANICAL, FARMING, SCIENTIFIC INDUSTRIAL, and New Books in general, can be ordered through Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, S. F., at publishers' rates.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Lost Papers.

If any subscriber fails to receive this paper promptly after making due inquiries at the Postoffice, he is urgently requested to notify this office by *letter*, that we may send the missing papers, and, if possible, guard against further irregularities.

Market Reports.

Lumber at Wholesale.

Following is the combination wholesale price list of Lumber, dating from April 6, 1885:

Pine—Rough, $15 00; No. 2, $12 00; do do in lengths, $13.00; rough, 40 to 50 ft lengths, $16.00; do 50 to 60 ft, $17.00; T and G Flooring, 1x6, $26.00; do do 1¼x6, $28.00; do do 1x4, $28.00; do do No. 2, $21.00; Vertical Grain T and G Flooring, 1x6, $30.00; do do do 1¼x6, $32.00; Stepping, $37.50; Furring, 1x2, per lineal ft, ¾ c.

Redwood—Rough, $17.00; No. 2, $13.00; Surfaced, $30.00; do 1x8, $28.00; do, 1x6, $28.00; T and G, 6 in, 12 ft and over, $28.00; do do, 7 to 11 ft, $25 00; do do, under 7 ft, $20.00; Rustic, $30.00; do No. 2, $25.00; T and G Beaded, 12 ft and over, $30.00; do do, 7 to 11 ft, $25.00; do do, under 7 ft, $20.00; Siding ½ in, $22.50; Picket, fancy $25.00; do rough pointed, $15.00; do do square, $14.00; Battens, ¼x3 in, per lineal ft, ¾ c; Shingles, $2.00; Laths, 1½, $3.25; do 1½, $3.75; Dunnage Boards, less 5 per cent, delivered, $16.00.

Lumber at Retail.

Retail quotations for fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet 1 rig, per M ft, $23.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱M ft, $38.50; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $20.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough, Merchantable, ₱M ft, $21.50; do Clear $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $26.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1-½inch, ₱M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

Pine—Rough, $14.00; No. 2, $11.00; do do in lengths $12.00; rough, 40 to 50 ft lengths, $15.00; do 50 to 60 ft, $16.00; T and G Flooring, 1x6, $25 00; do do 1¼x6, $27.00; do do 1x4, $27.00; do do No. 2, $20.00; Vertical Grain T and G Flooring, 1x6, $28.00; do do do 1¼x6, 1x4, $30.00; Stepping, $35.00; Furring, 1x2, per lineal ft, 1c.

Redwood—Rough, $16 00; No. 2, $12.00; Surfaced, $30.00; do, 1x8, $28.00; do, 1x6, $23.00; T and G, 0 in. 12 ft and over, $28.00; do do, 7 to 11 ft, $25.00; do do, under 7 ft, $20.00; Rustic, $30.00; do No. 2, $25.00; T and G Beaded, 12 ft and over, $30.00; do do, 7 to 11 ft, $25.00; do do, under 7 ft, $20.00; Siding, ½ in, $22 50; Picket, fancy, $25.00; do, rough pointed, $15.00; do do, square, $14.00; Battens, ¼x3 in, per lineal ft, ¾ c.; Shingles, $2.00; Laths, 1½, $3 25; do 1½, $3.75; Dunnage Boards, less 5 per cent, delivered, $16.00.

Nails.

We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.90: 8d and 9d, $3.00; 6d and 7d, $3.25 4d and 5d, $3.50; 3d, $4.25; 2d, $5.50

BARRELS.—¾ inch, $6.75; ½ inch, $5.75; 1 inch, $5.25; 1¼ inch, $4.50; 1½ inch, $4.25; 1¾ inch, $3.75; 1½ inch, $3.50.

LINING.—¾ inch, $7.25; ½ inch, $8.75.

TOBACCO.—10d, $3.25 8d, $3.50; 6d to 7d, $3.75.

CLINCH.—6d to 30d, $4.50.

SLATING.—5d, $3.75; 4d, $3.75; 3d, $4.50; 2d, $5.75.

FINISHING.—2d, 1 inch, $8.75; 3d, 1½ inch, $6.75; 4d, 1½ to 1¾ inch, $4.50; 6d, 2 inch, $4.25; 8d, 2½ inch, $4.00; 10d, 1 inch and over, $3.75.

CASING AND BOX.—10d to 30d, $3.50; 8d, $3.75; 6d, $8.00; 4d, $4.25; 3d, $5.25.

FINE BLIND.—4d, $4.50; 3d, $5.75; 2d, $6 50

CUT SPIKES.—All sizes, $3.00

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Material.

Lime, per barrel, $1.50@$1.60. Plaster, $2.75–3.00. Eastern Plaster, $3.00–3.25. Rosendale Cement, $2.10–2.25. Portland Cement, $3.50–3.75. Fire Brick, per 1,000, $30 @ $40, according to brand; hard, $9.00; red, $8.00; oft, $7.00@7.50; face, $25.00.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Swedeu, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 252 Market Street. Elevator, 12 Front St., S. F.

Mining and Scientific Books.

PUBLISHED OR FOR SALE, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

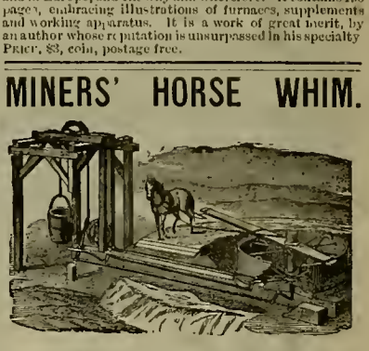
CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.

MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

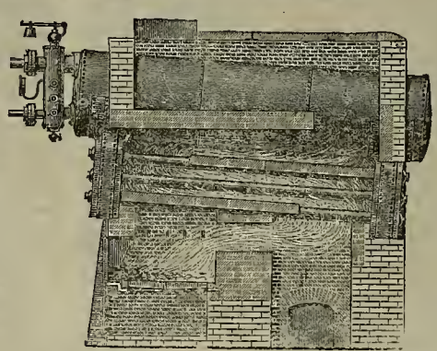
TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.



Send for Circular and Prices.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

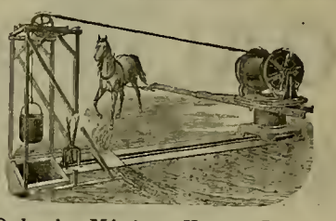
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 600 feet of five-eighths steel rope. SEND FOR CIRCULAR.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, MAY 9, 1885. VOLUME XLXX Number 19.

The Wostinghouse Engine.

In the Press of November 1, 1884, the general features of the Westinghouse engine were referred to, and it was stated at the time that on a future occasion we should give some details of the mechanism of the engine, which presents several novel features of interest to mechanics. The engravings on this page show the construction, figure 1 representing a cross-section through shaft, and figure 2 a cross-section through valve.

The cylinders, *A*, *A*, are cast in one piece with the valve chamber, *B*, and are bolted to the top of the bed or crank case, *C*. The cylinder heads, *a*, *a*, cover the upper ends of the cylinders only, the lower ends being uncovered and opening directly into the chamber of the crank case. The pistons, *D*, *D*, are of the "trunk" form, double walled at the top to prevent condensation, open at the bottom, and carrying the hardened steel wrist pins, *b*, *b*. They are packed with four rings.

The connecting rods, *F*, *F*, are hollow, with ribs, and are subject to compression only; the cranks, *G*, *G*, balanced by the bobs, *x*, *x*, the crank pin, *P*, and the crank shaft, *H*, *H*, are all of steel, and may be removed by taking off the crank case head, *C*. The steel of which the cranks are made is cast under pressure and is a true steel; its quality is shown by the fact that it may be drawn out and tempered for a lathe tool.

The crank shaft bearings are in the form of removable shells, *d*, *d*, lined with Babbitt-metal which is expanded into place under a hydraulic pressure of 15 tons per square inch of surface. A chamber is formed in the flange of the shell *d*, enclosed by the cover *d'*. In this chamber, and revolving with the shaft, is the wiper, *W*, which takes up the oil as it works past the bearings and returns it through the tube, *e*, into the crank case, *C*. This renders all other lubrication unnecessary, and keeps the engine clean. A syphon overflow, with a funnel head, *n*, prevents any accumulation of water from rising above the level of the pipe *e*, and at the same time prevents the escape of oil. This overflow may be piped off at the hole, *o*, in the funnel head, as convenient. Collar washers, *t*, *t*, of bronze form the end bearings of the cranks. Lead washers, *r*, prevent the taper sleeves from being taken up so as to cause binding. A center bearing, *K*, bridges the crank case, and receives the thrust of the pistons. The bonnet, *h*, is removed to give access to the cranks.

The valve, *V*, is of the piston variety, of improved construction, being built up from a neck and spider heads of malleable iron, and rings, the whole bound together by a hollow valve bolt, *V'*.

The valve guide, *J*, serves also in lieu of a stuffing box against the exhaust steam contained in the passages above it. The valve guide, as well as the valve, and both pistons, are packed with simple sprung rings of cast-iron.

The valve stem, *m*, is keyed fast to the guide and grips the valve without binding between the nut at the upper end and the collar at the lower end, as shown. Water is supplied to the tank case through the pipe, *R*, *R*, and the level indicated on the funnel head of the overflow pipe, before mentioned. The water cannot rise too high, but care should be taken that it never falls so low as to be out of sight in the funnel head. The drip pipe and valve, *u*, if left open will drain the exhaust passages into the crank case, and so maintain the supply if the engine shows a tendency to lose water slowly from the crank-case. It should not be opened enough to allow the exhaust steam to blow through. Oil for the lubrication of all the internal parts may also be added through the pipe, *R*, but it is preferable to maintain a constant feed into the oil-cups, *f*, *f*, on the main bearings, whereby their proper lubrication is first assured, and the oil afterward returned into the case by the wipers for the benefit of the crank-pin and all the other bearings. No other oiling than through these cups is required. The front portion of the jacket conceals the oil reservoir, *O*, which fills the entire space between the cylinders and delivers to the oil-cups, *f*, *f*, by the concealed pipes and the cocks, *l*, *l*. The reservoir once filled at *q* will last a long time, and the entire lubrication of the engine (except the valves and cylinders which are lubricated from the steam pipe in the usual way), is thus introduced from one point. The cocks, *l*, *l*, should be kept open to allow a constant but slow drip of oil into the cup. Common black West Virginia oil, worth 12 to 13 cents per gallon, is not only the cheapest, but by all means the best. *M* and *N* are respectively the steam and exhaust connections. The standard band wheel is a combination pulley, *Z*, and fly-wheel, *Y*, cast together so that the pulley overhangs the main bearings throwing the line of belt strain well toward the center of the bearing, and taking the spring off from the shaft.

The automatic governor is located on the shaft, *H*, between the cranks, and actuates the valve direct without rock shafts or other mechanism. The device in its essential features is old and well proved. It is entirely enclosed, no portion being in view.

In the engine each cylinder is single, acting downward. The annular steam port, *p*, communicates with the top of one cylinder and *p'* with the top of the other. Steam entering at *M*, and surrounding the valve in the chamber, *s*, *s*, is admitted to the top of each cylinder alternately, as the inside edges of the valve uncover the ports, *p*, *p'*, and the compression is controlled by the outside edges of the valve in the usual way. The exhaust into the top of the valve chamber finds its way to the exhaust pipe through the hollow neck of the valve. In the cut (Fig 2) steam is being admitted to the port, *p*, and is being exhausted through the port, *p'*. Very high speed may be attained by this engine, making it specially useful for many purposes, as for electric lighting, marine purposes, etc. It is very compact, and the working parts are all enclosed, while at the same time the parts are readily accessible. A skilled engineer is not necessary to run it. About 1,500 of these engines are now at work in the United States. Sales have increased to about 60 engines per month, and the makers have received as high as a twelfth order from individuals who have used them. They are made from four to 160 horse-power, and all parts can be duplicated. A number of them are in use in this city and on this Coast. Parke & Lacy, No. 21 Fremont street, and The Berry & Place Machine Co. (Parke & Lacy, proprietors), No. 12 California street, are agents for this Coast, and have an engine set up and running at No. 21 Fremont street, where it can be examined by those interested. On a future occasion we shall describe some of the other peculiarities of this engine.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

New Mexico.

[From our Traveling Correspondent.]

Georgetown District.

Nearly 25 miles nortb of Silver City is the lively little camp of Georgetown. As a steady bullion-producer this district has few equals, as well as a like scarcity of superiors. The reaction of a recent boom bas placed the camp on a solid business basis both in its mercantile and mine and milling interests. The town is orderly and prosperous; its inbabitants are cordial in their reception, and bospitable in their treatment of newcomers wbo propose to reside in or invest in tbe industries of the place. In addition to these commendable qualities they are honest and correct in their representations, a trait not often to be credited to a mining community. The town is prettily situated on the south side of a gently sloping bill; tbe mountain opposite raising more abruptly. On this mountain side are the principal mines of tbe district.

Formations and Ore Bodies.

The mineral-bearing ground is wbat is known as a horizontal-contact. The quartz and ore bodies occurring between lime and slate; the latter being the overhanging wall. The deposits are in chutes aud pockety chambers occurring continuously in the lime near the slate. At times rich bodies of ore have been taken from the lime a distance of 25 feet below the slate. Chloride, horn silver, lead, sulphurets and carbonate of silver is the character of these deposits. Chloride and horn silver to the extent of forty per cent; the balance a combination of the others. Tbe blanket-like mineral streak runs in between the lime and slate at a dip of about 34 degrees. The mineralization of the lime and quartz continues with depth varying in richness, the ore bodies occurring at intervals that indicate a permanency. The ores are free-milling, easy to concentrate and when concentrated run very high.

The Mines.

Commencing with tbe mines on which the most development has been done we have tbe the McGregor and tbe Commercial. Tbe former is owned by Malcolm and Alexander McGregor, two brothers who rank as pioneer minsrs of the camp. The Commercial is owned by Messrs. Smith & Tower, both residents of the district, and having a reputation as practical miners. A few Michigan people hold a small interest iu the Commercial. These two properties lie side by side. The development on both has been thorough and exteusive. The mineral belt covered by these mines is not only identical in character as well as similar in tbe grade of their ores. These two properties, in the hands of one management as practical and more venturesome tban eitber of the present owners, would be the nucleus of a big and lasting mine.

The McGregor.

The past history of the mine would read like a romance. The struggles of two brothers in their progress from poverty to affluence would make an interesting talc. The property has been worked for twelve years, and duriug that time has produced nearly $500,000. The brothers were compelled to sell stock in the mine for money with wbich to push development, and erect a mill for concentrating. Often during the time since the mine's discovery the two brothers consisted the entire force on the mine. The development has been conducted in a manner that is characteristic of the district. A more intricate net-work of tunnels and inclines would be difficult to imagine. Ore bodies of excellent grade have beeu passed through in many places in in search of richer deposits, that could be shipped without concentrating treatment. These and the many tons of low-grade ore on the dumps tbat can now be profitably treated hy the concentrator, will add to the output for a long time to come, even if no development was continued. During the present month three large and wonderfully rich beds of ore have been exposed, and their extent exceeds anything that has ever been opened up in the camp.

The Commercial.

The work done on this property shows not only a thorough knowledge of the peculiar formations, but a keen forcsightedness for the future utilization of every pound of ore that latter-day methods will successfully treat. The underground workings are conducted very much as the McGregor, only that the low-grade ore has been stored in tunnels and inclines and on dumps, hoisting only the high-grade and a portion of tbe low-grade; all waste dirt. Development has been pushed and the recent erection of modern labor-saviug machinery has put the mine in the lead as a finely equipped property. A two-compartment incline has been put down on the slate hanging wall a distance af 350 feet. Ths main lower levels of the entire mine are being pushed for a connection with this incline. The ore stored below will be taken out, and things will tben be in a shape to systematically and advantageously develop this already paying property. The development of a number of high-grade ore bodies recently at the lowest levels of the incline show that depth has not lessened the quantity or quality of the Commercial output.

Adjoining Properties.

The Naiad Queen and a number of other rich claims adjoin and are continuous on tbe mineral belt south of the McGregor and Commercial. These claims are owned hy the Mimbres Mining Company of New York. Tbe formations, ore deposits, manner of working and extent of delopment are similar to that of the McGregor aud Commercial. The company are working tbeir mines on the tribute system, compelling leases to treat the entire output at the stamp-mill of the company on tbe Mimbres rivsr, three miles below Georgetown. Any number of individual claims about the camp are pushing development and the shipment of ore and bullion is increasing in size aud value every week.

Driftings.

Three cars of ore recently shipped by the Commercial averaged $303, $325 and $365 per ton in silver and 18 per cent lead.

The stage fair to Silver City is $2.50.

The National hotel is the headquarters for tbe mining men of the district.

Georgetown mine-owners spend their money at home.

A 5-stamp mill witb Embry concentrators handle the McGregor ores. The concentrates run as higb as $500.

The freigbt rate from Wbitewater station, on tbe Deming and Silver City narrow gauge railroad to Socorro is $4.50 per ton on 100-oz. ore. From Georgetown to Wbitewater the freight is $4.50. Treatment at Socorro is $16 on ore and $20 on concentrates.

There are in tbe neigbborbood of 300 miners at work about Georgetown.

The San'a Rita copper mines between Silver City and Georgetown are not working at present.

Thers is very little base metal in the ores of this district.

In one of tbe lower levels of tbe McGregor a strong current of air comes out of a crack in the solid formation tbat appears to lead into a large cavity back under the mountaiu. The source of the supply is a mystery to all.

There must be all of 12,000 feet of development done on the McGregor mine.

The PRESS representative is indebted to Chas. Rosecrans for a handsome specimen of horn silver from the Naiad Queen.

Alex. McGregor is tbe leading assayer of ths camp. He is authority on the ores of the district.

Thos. P. Phehy, of Oakland, California, is running the Mimbres Mining Company's mill and mine under a lease. The mill is kept running steady.

The Mimbres mill is a 10 stamp combination (old Washoe) process, running eight amalgamating pans aud four settlers. Capacity, 20 tons per day.

The future pleasant relations between the Mimbres Mining Company and tbeir tribute workers will depend much upon the latter heing allowed to ship tbeir ore elsewhere for treatment.

Regular shipments hy the leading mines, prompt payment of wages and supply bills is establishing a good name and an extensive credit for Georgetown and its business men and mine-owners.

Frequent mention of this district will be made in the PRESS, and its increasing prosperity and new discoveries noted.

The Mogollon Mines.

This rich and recently discovered district is in the heart of the Mogollon mountains, nearly 90 miles north-west from Silver City and is in Socorro county. Silver City is the shipping point. The road, for a distance of nearly 80 miles, is an excellent one. Alma is the nearest valley town to tbs mines. From Alma the narrow road follows up Clear Creek canyon a distance of eight miles, in many places using the bed of the stream for ths road. Nearing the camp the size of the canyon grows smaller aud smaller; in a number of places blasting has been doue to make a passage-way for wagons. The mountains tower nearly perpendicular on each side in fantastic shapes; ths variegated colors in the fierce glow of a midday sun or the shadowy, towering peaks that loom, apparently, into the very skies on a moonlight night, baffles description. The grandeur of Colorado's celebrated Royal Gorge pales before the sublimity and natural beautics of this out-of-the-way but wouderful pathway of Clear creek's road to the valley of the San Francisco river.

The Camp of Cooney.

For ovsr a mile the cabins and rudely constructed business bouses of Cooney cling to the mountain's base almost on a level with the swiftly dasbing waters of tbe creek. Excavation for the rear end of the house and piling for the front being tbe order of most of the buildings. As yet the camp is small, and considering its age, remote location and a rough following of gamblsrs and sporting characters that exist in all new camps, the place is exceptionally orderly. Mitchell & Drew, two Arkansas boys, are the merchants of the place; they have no opposition and are growing wealthy accordingly. Tbe camp bas a reputation for richness and prosperity beyond its due. Outsids of a few stock compauies' property tbere is nothing to justify any great boom. Thers is no question as to its lasting and substantial qualities as a mining camp, for capital and enterprise eombined outside of this place would be like hundreds of other good camps now lying idle for want of capital.

The Mines.

The Silver Bar mine, better known as the "Cooney," is the leading mine, so far as development and output is concerned. Tbe mine was discovered by J. C. Cooney, a pioneer miner, wbo was killed by tbe Indians near tbe camp wbich now bears his name. His beirs and a number of Iowa capitalists now own the property. The mountains on both sides of the creek, at the point where the vein crosses, raise abrubtly at an angle tbat is nearly perpendicular to a bigbt of nearly 1,800 feet. A 700-foot tunnel on the vein from tbe creek level goes in ou a regular vein between two firm and well-defined walls. Above tbis, and connected by a 285 foot incline shaft, is a similar tunnel that goes into the hill an equal distance. Nsarly on tbe summit of the mountain, over the breast of the lower tunnel, a 60-foot shaft is down on ore. The following description of the extension of this mine will, owing to its lower location and superior surface indications, give the reader a better idea of the mines of the district:

The Silver Bar No 2.

This mine is the northern extension of the Silver Bar or "Cooney." Although not as extensively developed it bas every indication of proving a bigger bonanza tban tbe Cooney. John A. Miller, of Silver City, N. M., and San Francisco capitalists own the mine. Californians could not have thsir interests entrustcd to a more progressivs and capable man than they have in general manager John A. Miller. The claim is 600x1,200. The vein is so near a true fissure that it must be called a contact fissure; running nortb-west and south-east, occurring between two well-defined walls, tbe foot-wall being a dioritic porphyry, and the hanging wall a spatbic porphyry. The vein at all places exposed shows ore from wall to wall. The pay streak varying from 3 to 12 feet in width. The ore is a silver and copper-silver glance of the "peacock" variety.

Development.

The croppings of tbe vein for a distance of 100 feet or more bave been removed across the face of the east end, and a prettier sight tban the immense body of beautifully colored peacock ore from 4 to 12 feet wide, is seldom seen by miners. The veiu has a 50-foot shaft down on tbis ore from the surface. A tunnel from the bank of the creek has been run in on the east end of the vein, and at its breast a 30-foot shaft is down below the tunnel on ore. A tunnel driven in from the side-hill to tap the vein below the bottom of ths 50-foot shaft on the snrface, has cut the vein and shows it to be nearly 12 feet in width at this deptb; which is about 75 feet. A number of open cuts have exposed ore the most of wbich is higb-grade. The croppings of the vein show plainly across the face of the claim its entire length.

The Ores.

The following assays of the vein matter will properly illustrate the character and valus of the ores:

	Ounces silver
Average of ore on dump	136
Oxidized copper ore	71
Black oxide of copper	245
Copper pyrites	50
Blue carbonate of copper	166
Average of dump on platform	193
Peacock copper	153
Gray copper and pyrites	110
Gray and yellow copper	70
Copper oxide and sulphurets	72
Copper pyrites in quartz	42

The forgoing does not include any of the numerous returns from the unusually high-grade ore of the mine, but represents the general run of that which goes to make up the bulk of ths first-class or shipping grade of ore. An average of 50 odd assays, inclusive of everything from wall rock with no more than a trace, to ore carrying 1,000 ounces, was 120 ounces in silver.

Mining and Milling.

The extraction of ore from this mine is easily and cheaply accomplished. A concentrator with a capacity of 50 tons per day is being erected by J. B. White & Co., of San Francisco, under the supervision of B. O. Cutter. By this concentrator low-grade ores can he incrcased in value six times their worth on coming out of the mine. The concentrates wheu ready for shipment will run from 500 to 1,000 ounces; more probably will average the latter. President Miller expects to have the concentrator up aud running about June 1st, and after it once starts there is no question about its being supplied for years from the great vein of the Peacock. Shipments already mads havs resulted in excellent returns. The many ore dumps represent a large sum of money and will be realized on very sbortly. Owing to tbe narrowness of tbe canyon and the almost perpendicular incline of the mountain side much difficulty was experienced in making a place to pile the ore, causing almost a total suspeusion of work on tbis account. A large forcs of men are at work erecting ths concentrator, on the completion of which ths mins will be developed extensively and hy a management that knows its business.

Other Mines.

The Silver Bar No. 2 adjoins Miller's Silver Bar No. 1 on the north, and is owned hy a St. Louis company. The development is superintended by Joe Sheridan, and consists of a cross-cut tunnel ovsr 450 feet in length near tbs middle of tbe claim, which intersects ths vein 350 feet below the surface, sbowing at point of intersection seven feet of low-grade rock. Lateral drifts bave been run on tbe vein wbich show good indications of increase of value of ors. Immediately above the intersection of tbs tunnel a cut and shaft 35 feet deep has been made, sbowing a vein 12 fest wide with two feet of ore, wbich runs from 30 to 80 ounces silver and $60 to $100 gold. Other tunnels and shafts show up in a like manner.

The Tam O'Shantsr is owned by Joe E. Sberidan and lies adjacent to the Cooney mine, and carries the same cbaracter of ore But littls development has been done; it, bowever, shows well for the labor expended.

On Silver Creek.

The Keno mine shows well, with mill returns of ovsr 400 ounces of silver and two ounces of gold.

The Niles sbows a fine ore body; neitber claims have been developed to any extent worth mention.

Lambert's aviary, consisting of tbe Blue Bird, Red Bird, Black Bird, Late Bird, Early Bird, with all the balance of bis feathered songsters, makes a fine group of mines which show up finely in their gold and silver plumage, tbs Blue Bird claim having turned out some of the richest gold rock ever taken out in the Territory.

Tbe Buckhorn, owned by Eli Mader, sbows a fine vein of ore running from 50 to 200 ounces silver and $20 to $100 gold.

The Eureka, Mohawk, Colorado, Little Maud, Smuggler and Queen sbow well and have fair bodies of ore, but have no development sufficient to determine the extent of ors bodies.

On the Slayback claim, between Silver and Mineral creeks, J. E. Sheridan has an 80-foot sbaft showing an 8-foot vein of guld ore ruoning from $5 to $36 per ton.

Tailings.

The Copper King, on a vein running parallel with ths Miller, has a 4-foot ore body that will average about $50 per ton. A two-fifths interest has just been sold in tbis mine for $30,000.

Al. Louderbough, one of the most genial and accommodating of stage men, is proprietor of the Alma and Silver City stage line.

Cooney has a semi-weekly mail and is already clamoring for a daily.

A two days' ride, one night's lodging and $11 stage fare is the traveler's program from Silver City to Cooney.

Frank Viugoe, an old-time miuer, bas *charge de affairs* of the Cooney mine.

If capital will take out and concentrate the ore of the mines about this place and set big plants of machinery for the treatment of ores alone they will make money.

Wood and water are abundant.

Wages run from $2 to $3.50 per day.

Silver City checks arc used to pay off the miners with. These checks are taken for their full value hy business men and gamblers, principally the latter.

The ores of the Cooney are concentrated by a five-stamp mill and three Frue vans, the pulp ruuning from the battery over one and elevated above and run over the two remaining vans; the water used on these being hot instead of cold as generally used.

There is a rumor to the effect that the Cooney mine is being worked under a lease from the company by the preseut management.

The concentrates of the Miller and Cooney mill average way up, two cars netting $17,295.14.

The Argo smelting works, of Denver, get the most of ths Cooney ores.

A few more mines managed hy a get-up-and-get style like the Miller miue and Cooney will be a district "the observed of all observers."

J. C. Woodward, an old-time Californian, is superintendent of the Silver Bar No. 1.

The future progress of the Mogollon mine will be watched and a mention of her strides in a steady a regular producing camp noted by the MINING AND SCIENTIFIC PRESS.

F. W. S.

MECHANICAL PROGRESS.

Revolution in the Iron Trade—Making Steel Cheaply.

The latest discovery in metallurgy the Clapp-Griffiths process—appears to be attracting much attention. It is claimed that by it steel may be made at less cost than muck bar from pig-iron. The *Scientific American* refers to the matter as follows:

Early last year people about Pittsburgh had their curiosity much aroused by mysterious performances at the works of Oliver Brothers. A part of the establishment was carefully boarded and locked, and jealously guarded from all intrusion, and for a long time nobody was admitted. Indeed, while everybody wondered what was going on, and among iron-workers particularly a great deal of curiosity was excited, the secret was so well kept that the nature of the operation did not become known to anybody until in the last month, unless it was to those who had special information of the affairs and prospects of the great firm of Oliver Brothers after its suspension. But now, through papers submitted at the annual meeting of the American Institute of Engineers and publications in local journals, the public is assured that a new process for working iron has been thoroughly tested, and has not only met the scrutiny of experts, but has demonstrated its immense practical value.

Its effect upon the future wages of skilled iron-workers will probably be appreciated from the statement now made, that, while steel of a peculiarly excellent quality, and especially adapted to many uses in preference to malleable iron, has been produced in large quantities and placed upon the market, only one workman in the whole establishment has needed such skill or training as to receive wages averaging as much as $2.50 a day. By the new process, which is entitled the Clapp-Griffiths process, the silicon is so completely removed from the iron that, notwithstanding the presence of a proportion of phosphorus usually found fatal, steel of a high grade and of a remarkably useful quality is made. To the practical iron-worker, however, the most startling fact remains that the cost of this treatment is less than half the present cost of making the ordinary pig-iron into muck bar.

At the wages now paid in Pittsburg it is reckoned that it costs $12.75 per ton to make muck bar from pig-iron, but by the new process a metal far more useful, in better shape for handling, is produced at less waste, with a cost of only $6 per ton added to the cost of the pig. Moreover, it is shown that by applying the comparatively inexpensive plant required in this process in connection with ordinary blast furnaces, and taking the molten iron as it is required hot from the blast-furnace for treatment in the converter, the cost of producing the ton of steel will be only $3 or $4 more than the cost of producing the ton of iron.

"In the last year," adds the writer, "Oliver Brothers & Phillips have turned out many hundred tons of this metal in different forms, such as tacks, rivets, wire rods, telegraph wire, lightning rods, horse-shoe nails, pipe strips, plates, sheets, bars, angles, shovels, spades and stamping iron, which have given great satisfaction to consumers." The metal possesses, according to Captain W. R. Hunt, of Troy, who reported on the subject to the American Institute of Engineers, "an ever-constant welding property with great toughness." He further says: "I obtained steel with 54 per cent of phosphorous, and my surprise certainly did not decrease when I saw the test piece bend double, cold, and the metal work beautifully when hot." As respects the cost, Mr. Witherow, of New Castle, Pennsylvania, who has been associated with Mr. Oliver in the work, presented a paper in which he stated that careful account of expenses while making about 2,000 tons of this steel had been kept, and "including cost of the ferro-manganese, coke, and keeping up the plant, expenses for steam-power, labor, and everything connected with the process, it did not exceed $6.50 per ton over the price of the pig iron used." But, as he further showed, much greater economy can be had in a production of the steel blooms in direct connection with the blast-furnace.

Another great innovation in steel-making processes is announced in England, which, according to the London *Iron and Coal Trades Review*, will put an almost certain end to the malleable iron trade at once, as steel ingots could be made at far less cost than that at which puddled bars are now made. It will be observed that this process appears from the description to be like the one so successfully introduced in Pittsburg, at least in general results, and in probable economy of working.

Tools Past and Present.

There is a discussion going on among English machinists as to the past and present quality of tool steel. One intelligent writer says: "The demands of the engineer upon the makers of tool steel are more severe than ever before, and I venture to think that it was fortunate for the old melters that they knew nothing of turning and slotting steel castings, and hammered steel shafting, and they certainly never were expected to produce a steel capable of turning a 6 ft. long bar of hard Bessemer steel, 5 in. diam., down to 4 in. diam. at one cut and with one grinding, the tool sliding 1 in. for sixteen revolutions; and we hold that steel to do this is worth all the trouble and expense it costs to produce it."

EARLY COMPOUND ENGINES.—From particulars furnished by a correspondent of the *Journal* of the Franklin Institute it would seem that the compound engine is not so recent an invention as many suppose. "The first compound engines (he writes) are said to have been built by Mr. I. P. Allaire. As early as 1830 and 1832 there were on the Hudson river two steamboats with compound engines, the Swiftsure and Commerce. Their engines were of the upright square form, or cross-head pattern (very few of that form now in use, and none built), the high-pressure cylinder being forward and the low-pressure being abaft the paddle-wheel shaft, and both connected to it by cog-wheel gearing. About the same time the Post Boy, with similar machinery, built by Mr. Allaire, was sent to New Orleans. In the machinery of the above steamers the exhaust steam of the high pressure cylinder passed directly to the low-pressure cylinder without the intervention of valves or receiver between the two cylinders. The Swiftsure and Commerce were in use several years, and the machinery of the former was subsequently taken out and replaced by the ordinary beam engine. The compound engine, built by the late Erastus Smith, was of ordinary beam pattern, except that it had two steam cylinders, the high-pressure being within the low-pressure one. Their diameters were 37 and 80 inches, and stroke of piston 11 feet. This form has not been duplicated. The present compound engine has practically but little resemblance to those that preceded it, and is very much more economical."—*Ex.*

A FRANK ADMISSION.—Mr. Arthur Rigg, in a paper recently read before the English Society of Engineers, gives his countrymen some advice, in which he pays so high a compliment to this country that we ought, perhaps, not to accept without some reservation. Mr. Rigg said: "The idea of putting up everything cheaply not only saps the foundations of permanent success, but depreciates the quality of manufactured articles and destroys honest dealing. Thus some of our goods are being driven out of foreign markets and replaced by the more honest American productions. The writer considers it the most genuine patriotism to tell his countrymen the truth without disguise; believing that we can never lead the van of progress if we shut our eyes to what goes on in the world around. America is the best country for us to copy from, as it is inhabited by our own people; and there is more for an engineer to learn there than from any other place in the world. It welcomes every new invention, and the man of genius can hope for an early reward to his labor; while the engineer can freely obey the sound maxims—first, make sure of those general principles you intend to apply, then trust them implicitly; and finally, never be afraid to carry them out."

THE BEST STEAM BOILER.—A boiler will be so arranged that the globules of steam shall escape from beneath the water surface as near as possible to the point where the heat is greatest. Conversely the feed-water will be brought into the boiler at the point where the gas from the fire is the coolest, or close to the point where it finally escapes from the boiler tubes, or from the inclosure of the boiler walls into the chimney. The heat which remains in the gaseous current as it passes away is most effectively absorbed by contact with the coldest water, which, under all the conditions of the case it can possibly be made to encounter, and this is obviously the feed-water at or near the point of admission into the boiler. On the other hand, the steam as it escapes from the boiler should carry with it the largest fraction of heat that is possible, and this can be assured only, or most fully, by its contact up to the latest moment with the most highly heated part of the gaseous currents which are produced.—*Industrial World.*

A LADY MACHINIST.—A young lady of 17, studying at one of our large educational institutions, is pursuing a course of study that half a century ago would have marked her as an extraordinary example of independence. She has chosen the mechanic arts, and takes shop practice, studies machinery and its necessary accompaniments of science and mathematics, and in all branches acquits herself to the satisfaction of her teacher. Her object in pursuing a calling considered usually fit only for the masculine intellect, is to enable her to assist her father in his large manufactory at Rochester. At graduation she will be an accomplished machinist, and a valuable member of the firm.—*Boston Journal.*

TO PREVENT RADIATION.—A fabric for covering heated surfaces, so as to prevent radiation, has been patented by H. W. Johns, of New York City. It consists of a piece of heavy paper or sheathing, corrugated from end to end. Into the corrugations, rolls, ropes or hats are placed. These rolls or bats are retained in place by glue, cement or in other suitable manner. They are used on either one or both sides of the sheathing, and they are surrounded preferably by a sheet of asbestos, which protects them from the direct action of the heat. If desired, the rolls may be saturated with a hardening substance, such as silicate of soda.

SCIENTIFIC PROGRESS.

How Smoke is Formed.

The following are the views of a correspondent in London *Iron* on this subject:

"Hundreds of articles have been written and have been printed in newspapers, and many valuable lectures have been given on the important subject of smoke and its destructive properties, but I have never met a clear explanation as to how smoke is formed or what is the cause of smoke forming. In the most important book of the Smoke Abatement Exhibition even, where the highest talent of the day kindly gave valuable time to the subject, not a sentence is given as to how or in what way smoke is formed. I may almost go further, and say that it appears as if learned men did not agree, or had not made up their minds, if in certain cases smoke is formed, or if the smoke so formed is afterward consumed. I have a circular before me where the test of a boiler is given by a high authority, which states: 'The boiler either does not produce it, or it consumes its own smoke.' This will show that there is not yet a clear explanation before the public as to how smoke is formed, and I maintain that cause and effect ought to be properly understood before the necessary care in preventing it can be taken; therefore, a clear and most simple case may be here stated.

"It is well known to every one that when fresh coals are placed on a fire in an open fire-grate, smoke arises immediately; and the cause of this smoke is not very far to seek, as it will be easily understood that before the fresh coals were put upon the fire within the grate, the glowing coals radiated their heat and warmed the air above, and thereby enabled the rising gases at once to combine with the warmed air to produce combustion; but when the fresh coals are placed upon the fire they absorb the heat and the air above remains cold.

"By gases, I mean the gases arising from coals while on or near a fire; and it may not be known to every one that we do not burn coals, oils, tallow or wood, but only the gases arising therefrom. I can make this clear by the lighting of a candle, which will afford all the information required. By lighting the candle fire is set to the wick, which by its warmth melts a small quantity of tallow below, and this melted tallow is directly absorbed by the capillary tubes of the wick, and thereby so very finely and thinly distributed that the burning wick has heat enough to be absorbed by the small quantity of dissolved tallow to form the same into gases, and these gases burning, combined with the oxygen in the atmosphere, give the light of the candle. A similar process is going on in all other materials; but coal contains already about 17 per cent in weight of gases, which liberate themselves as soon as they get a little warm. The smaller the coal the more rapidly will the gases be liberated, so that in many cases only part of the gases are consumed.

"To return to the subject, the fact is that the volatile rising gases from the coal cannot combine with the cold air for combustion, still a combination does take place in the following way: The cold air, in the act of combination, absorbs a part of the warmth of the rising gases, which they cannot spare, and therefore must condense, so much so that small particles are formed, which aggregate and are called smoke, and, when collected, produced soot; but so long as these particles and gases are floating they cannot burn or produce combustion, as they are surrounded by a thin film of carbonic acid. It is only when collected and the acid is driven off that they burn rapidly.

"I have now shown that cold air is the cause of smoke, which may be greatly reduced by care. In the open fire-grate the existing fire ought to be drawn to the front of the grate, and the fresh coal placed behind or on the back of the fire. The fire in the front will then burn more rapidly, warm the air above, and prepare the rising gases for combustion. In this way smoke is diminished, as the gases from the coals at the back rise much more slowly than when placed upon the fire and the air partly warmed. The same process may be applied to kitcheners, thereby almost entirely preventing smoke after the first lighting. For stoves and boilers, warm air may be produced for the entire combustion of all gases."

Life Within Life.

The doctrine that the bodies of all the higher plants and animals are aggregations of myriads of minute, and in many respects independent, cells, had its origin some fifty years ago. Though now universally accepted by biologists as an essentially correct generalization, it has not yet become one of those scientific facts widely known to and accepted by the general educated public. To the "average man" the proposition that his body is a collection of thousands of microscopic masses of living matter, each of which lives its life in more or less harmony with the rest, but to a great extent without any reference to them, is an astounding one. He finds it nearly impossible to realize that in certain respects he is rather a nation than an individual; that his bodily life is the algebraical sum of the living and doing of hundreds of thousands of cells, much as the vitality and activity of a nation is the resultant of the actions of all its inhabitants. His physical life is to him an entity. In consequence there is nothing which the physiologist finds it harder to make comprehensible to the laity, than that a frog, as a complete animal, may be killed by destruction of its nervous system, yet most of its organs remain alive for hours; also the fact that it is not only possible in many cases to isolate particular organs or cells, keeping them alive for study after killing the rest of the plant or animal, but that this is even necessary, if the working of any complex organism is to be really understood. This popular ignorance, like all ignorance, has evil results. Much of the disquietude which many persons now feel in regard to physiological experiment is due to the fact that they do not realize that experiments on living hearts or muscles are usually carried out on animals which, as a whole, have been previously killed by destruction of the brain.—*Science.*

About Thermometers.

"Thermometers are curious instruments," said a dealer who was recently interviewed by a reporter. "Sometimes we find one that is all right at certain points and at others it will vary several degrees."

"What causes the variations?"

"The irregularities of the tube. They are frequently imperfect. At some point the tube may be too large, and when the mercury rises to that point it is depressed too much. The tubes have to be seasoned. This requires a year or two. Glass changes almost like wood. When it is new it expands, contracts and warps almost as badly as green wood. Frequently people come in and tell me that their thermometers registered 15 or 20 degrees below zero, when in fact it was only 10 or 12 degrees below. All cheap thermometers vary more or less."

"Where are the best thermometers made?"

"In London. There are two manufactories in this country—one at New Lebanon, N. Y., and the other at Rochester. The imported thermometers are too expensive for general use."

"How are they made?"

"The tube is blown into the size wanted, the top being left open. The bulb is heated to expel the air and while hot is inverted in a cup of mercury. As the tube cools the mercury is drawn up into the tube. The open end is then closed up and the tube placed on a scale. It is put into water of a known temperature and the point to which the mercury rises is marked. A number of tests of this sort are made before the instrument is placed on the market."

"How can we tell whether our thermometers are accurate?"

"There is at Harvard University a place for testing thermometers. They are carefully examined at various temperatures and any variation is marked. A certificate is given with every thermometer examined."

HOW TO IDENTIFY DIAMONDS.—The following is said to be an almost infallible test to distinguish a diamond, either from any imitation, however skillfully made, or from any other white stone: Prick a needle-hole through a card and look at it through the doubtful stone. If it is spurious, two holes will be seen distinctly on the card; if it is a diamond, but one; for there is no stone at all resembling a diamond that does not give a double reflection. This test is a delicate one, because it is difficult to see even a sharp, well-defined object through the diamond. This property is also made use of for determining an uncertain stone. If the finger is placed behind it and looked at through the stone with a magnifier, the grain of the skin will be plainly visible if the stone is not a diamond, but otherwise it will not be distinguished at all. A diamond in a solid setting may be identified in the same way; if genuine, the setting at the back cannot be distinguished, but if a false stone or strass either the foil or setting may be plainly seen.

INDESTRUCTIBLE LIFE.—A matter of surprise and wonder to those who witness it for the first time is the rousing to life of whole colonies of infusoria by the addition of a drop of water to a few grains of earth or dust. These microscopic organisms abound everywhere in water containing decomposing vegetable or animal matter, and some forms may, in a dried state, remain for months or even years apparently dead, to be revived when water is again supplied to them. Jabez Hogg has been experimenting during the past three years with one form of infusorial life—the rotifers or wheel animalcules—and has even kept dried specimens for a time at a temperature of 200 degrees Fahrenheit, and afterward exposed them to intense cold, neither process killing them nor greatly diminishing their vital powers. Mr. Hogg supposes that as the animal dries it shuts itself up like a telescope, its skin taking an egg-like shape, and that a secreting organ coats the body with a gelatinous envelope which protects it from further change.

DETERMINING DEATH.—A new agent for determining the question of apparent death is announced by an electrician, who says that in bodies in which life is not extinct the temperature rises upon the application of an electric current, but never in the case of actual death.

PENETRATING POWER OF PLANT ROOTS.—While excavating a well in York, Maine, the workmen found the roots of neighboring oak and hickory trees imbedded in the rock forty feet below the surface. In many instances they had formed cylindrical channels in the stone.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 304-05.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 308.

Passing Events.

The starting up of the Parrott works at Butte, Montana, and of the Richmond works at Eureka, Nevada, are not only good indications for those camps, but may be considered as hopeful signs for the mining industry. Both these large works have been closed down for some months.

Since our last issue the whole tone of the news from Europe has been changed from a warlike to a peaceful nature, and the prospects now are that war will be averted.

Considerable attention is just now being turned to Southern Oregon by prospectors. The quartz interests of that section have long been neglected, but the probability now is that more prospecting will be done and some of the mines which have been found will be developed.

The northern counties of California are still attracting a large number of miners and prospectors, and the indications are that the regions thereabouts will be pretty well prospected during the summer.

The chlorination test of tailings that has been made in the Howell roaster at Bullionville has been highly satisfactory, Mr. Russell having leached them on a small scale up to 78 per cent. This test guarantees the erection of the large Stedefelt furnace.

ANOTHER discovery of gold is reported from the East. Fritztown, Pa., is the scene of the excitement this time, and, as usual, "the land on the farm where gold was found has risen greatly in price."

THE Comstock pay-rolls for April were $100,827.

SILVER seems to be going up slowly.

A Remarkable Meteor.

On Sunday evening, the 19th ult., while Mr. Fremont Morse, of the U. S. Coast Survey, C. W. Brewster and C. B. Hill were standing in the enclosure of the Davidson Observatory in this city, they noticed the sky suddenly light up and a magnificent meteor shot very rapidly from a point in Gemini toward the south-west borizon. The time was 11 h. 06 m. by 120th meridian time. Looking toward the west the path of the meteor was inclined about 20 degrees to the north of a perpendicular to the horizon, and its duration was about three-quarters of a second. But the most remarkable feature of the phenomenon was the persistence and character of the vivid train which remained about the center of its path. At 11 h. 06 m. this consisted of a line of light like a comet's tail, say 8 degrees in length and half a degree broad, situated just under the triangle of Cancer. Almost immediately the center began to fall to the south and at 11 h. 08 min. it had assumed a wave or snake-like form. This drawing out continued, until at 11 h. 09 m. it was a perfect letter V, and a few minutes later, at 11 h. 12 m. it still remained as a horizontal patch of hazy light, which slowly drifted toward the south, remaining in sight for probably nine or ten minutes from the first apparition.

These facts were communicated to the California Academy of Sciences at its last meeting by Mr. Hill; and Prof. Davidson also read a brief note concerning the April meteors. There is a periodicity and position of the meteors about April 20th which have given rise to much speculation as to the relation between this stream and the first comet of 1861. The characteristics of these meteors are their great brightness and their leaving persistent tails. The first comet of 1861 arrived at its descending node on the 20th of April and then passed only 214,000 miles within the orbit of the earth.

Although the period of the comet has been computed at 415 years, it is supposed to have been influenced in this orbit by one of the exterior planets. Hind suggests Saturn, and Kirkwood suggested Uranus (1873). Hind has gathered together several brilliant displays of the April meteors dating back before Christ, and bringing the dates up to 1803. From his computations he predicted a period of 27 years, and that we might expect a bright display in 1884. But the date of the previous displays are too far apart to warrant a specified period.

The display this year of several brilliant meteors on the 19th and 20th of April shows that the stream is persistent and maintains its characteristics.

Mining Department at the University.

The largest attendance upon the College of Mining in the University of California immediately followed the great mining developments on the Comstock. In fact the entire university temporarily profited by that development. To students in mining, certainly, most promising careers seemed to many at that time to be opening, and a greater number of young men sought to avail themselves of the opportunities offered in the College of Mining than presented themselves before or than have presented themselves since. Judgments formed during the excitement and over-confidence attending such rich developments, as well as those that followed the working out of bodies of ore that were thought to be inexhaustible, were doubtless in many cases hasty. When the bonanzas were worked out it seems to have been assumed as a matter of course that there was likely to be but little opportunity for the mining engineer or metallurgist. But the opposite conclusion would have been more legitimate.

The discovery of a large ore deposit, and of economical methods of working it, does not necessarily create a great demand for mining engineers and metallurgists. They are most needed after the rich and easily worked ores have been exhausted, and when the problem of profitably working low-grade or rebellious ores is to be solved; and when, also, expert judgments are needed to determine whether certain ore indications warrant the expenditure of considerable sums of money in testing the indications. New and valuable mining deposits await development, both in the United States and in Mexico, properties that in the development and working will require the constant service of the most competent engineers. It is probable, then, that there never was a time when the prospect for an educated mining engineer or metallurgist was better than to-day. It can hardly be doubted that better and more economical methods of working low-grade and rebellious ores will yet be discovered, and certainly no more creditable or inviting work could be desired by a student of mining or an expert metallurgist.

For training and instruction in such work excellent facilities are offered in the well-equipped laboratory of the mining department of the University. To the equipment already in use important additions are made as occasion offers. The laboratory practice of the last two years has consisted, in great part, in approved methods of assaying lead, gold, silver, antimony, copper, tin, nickel, cobalt, iron, and fuels. In this laboratory work, the students have, as far as possible, taken part. The departments of chemistry, civil engineering, mineralogy, etc., are adjuncts to the mining, for those pursuing a special course. Mr. S. B. Christy, who is in charge of the mining department, takes the greatest interest in his branch and would be glad to have larger classes than now attend.

It would seem that on this Coast when such good opportunities are offered there would be many young men who would desire to take the mining course at the University. In a mining country such as this there are plenty of openings for trained young men to commence work, where they can gain valuable experience. After passing through the mining school at the University they will be in a position to observe intelligently and in a short time be able to take charge of works.

Measuring Air Currents in Mines.

The practice of periodical observations of the anemometer, entered in a special register of the ventilation of the mine, is rendered obligatory and practiced throughout England. The object of the anemometrical measurements should not be merely to give information of the total volume of air at its entrance to or its exit from the mine, or at the bottom of the shafts, but especially the volumes circulating to advantage in a given district and even in a given working place. It is for such a purpose that they should be taken regularly. It is necessary to guard against erroneous indications which might result from inaccurate observations, especially on account of the variation of speeds in one and the same section of an airway where the operation takes place. These observations should be arranged in such a way as to give the mean speed with sufficient exactitude.

The most important of the appliances for control and supervision to be erected permanently is an appliance suitable for making known the volume of air at a point judiciously chosen. Among these appliances mention is made by the French Fire-damp Commission of that devised by M. Murgue and described by him in the monthly report of the Societe de l'Industrie Minerale (1880, p. 120), and the anemometrical tube of M. Bourdon. This last-named appliance may be made self-registering by combining it with instruments for measuring the diminution of pressure.

To have all these data necessary for a complete knowledge of the ventilation of a mine, it is necessary to know, besides the volume of air which circulates therein, the excess or diminution of pressure under which the ventilation is effected.

In mines ventilated by fans this measure by registering appliances is an easy matter and generally practiced. In mines ventilated by furnaces or naturally, it is possible quite as easily to measure and register, if it be desired, the diminution of pressure at the bottom of the shafts or adits, which serve as inlet or outlet airways, when these airways terminate at the same level, and when they are sufficiently near one to the other.

When this is not the case the only method would be to make the comparison of observations of barometers suitably installed and duly observed both underground and on the surface, a solution more theoretical than practical. In principle the continued observations of diminutions of pressure may supplement all direct measure of the speed of a fan; with any given appliance one of these quantities is at once deduced from the other. Nevertheless, there is interest and utility as regards the very inspection of the fan to provide every fan engine with a counter in addition. A counter, even self-registering can only give useful indications in connection with this subject if it permits of calculating the speed of the engine at any moment.

A totalizing counter is a simple appliance that keeps a check upon the engine-man—an appliance which will only be really useful if its readings be checked at any moment, at irregular but sufficiently frequent intervals. That variations of the thermometer should exert a capital influence on natural ventilation is very evident, since this kind of ventilation depends upon differences of temperature.

Sampling Ores.

The erection of large metallurgical establishments for the treatment of gold, silver, copper and lead ores, at railroad and geographical centers, where fuel and fluxes, together with proper ore mixtures, can be cheaply and constantly obtained at all seasons of the year, has led to the very general introduction of a system of "public sampling." By this system, the ores instead of being shipped direct to the mill or smelter, is sent to a public sampler, where it is crushed and sampled. Guarantee samples are sent to the different metallurgical establishments, and the ore is then sold to the highest bidder. The steadily increasing practice of leaving mines to working miners has also given a great impetus to the system of public sampling, These men will not employ a common agent and the public sampler meets their wants and renders the presence of the owner at the valuation and sale of the ore, wholly unnecessary. The system is also a benefit to the buyer. When the sampling and assaying is performed by a third party, the former endless disputes between miner and smelter are no longer possible. Moreover, instead of having to take all ore sent there, the metallurgical establishments need only bid on such ores as are required in their mixtures, the large variety of ores from which they have to select more than compensating for the increased cost.

Before the introduction of public sampling, the ore, after being crushed, was generally sampled by hand, either by taking every fifth or tenth shovelful by "quartering," or by the "split shovel."

Since large quantities of ore have now to be handled, and close competition has made cheaper methods of work an absolute necessity, mechanical sampling, in some form or other, has become almost universal. While the devices employed for this purpose exhibit an almost infinite variety of type, yet they all work upon the same general principles, viz.: by dividing or cutting out from a falling stream of ore, by means of narrow spouts, dividing flanges or traveling buckets, a certain percentage, which is taken to represent an average sample of the whole.

Many of the samplers exhibit a vast amount of ingenuity, and upon dry ore, crushed and screened to a uniform size, and perfectly free from strings, chips, rocks, etc., some of them will yield perfectly accurate results.

Unfortunately, however, these conditions are rarely realized in practice; and the result has been that both sellers and buyers have very often insisted on checking the work by means of hand-sampling. Even if the above objections did not occur, many of the samples would still give inaccurate results; since a stream of falling ore, either in a vertical or in an inclined spout, is never entirely homogeneous in all its parts, there being a constant tendency to a greater proportion of coarse, rapidly traveling particles in the center of the stream, and an excess of finer, slower moving particles on the edges. Consequently no part of the stream would exactly represent the average of the whole.

Again, where intercepting buckets are used, the coarse, heavy particles often rebound from the buckets and fall into the rejected ore, thereby rendering the sample inaccurate. Even the fine crushing and accurate sizing required by the best of these devices is a decided objection, if the ore is to be afterward treated in a shaft-furnace, where an undue proportion of fine stuff not only increases the loss in dust, but materially reduces the daily capacity of the furnace. These statements we take from a paper read recently before the American Institute of Mining Engineers, by D. W. Brunton, of Denver, Colorado, who has devised a new system, which is described in the PRESS of last week.

Work Accomplished by Miners.

It will be readily conceded that the miner of to-day is enabled to accomplish more work in a given time than the miner of 25 or 30 years back Not that the men themselves are physically superior, but that their appliances and tools are more perfectly adapted to the work, and experience has brought forward plans and systems greatly in advance of those in vogue years ago. On this Coast the miners are better paid for their labor than anywhere else, though in older regions where coal and iron mining prevail the wages have not increased with the increased result of the work. In Europe this is particularly the case. Among other things which are just now subjects of discussion among the French miners, it is contended that the average rate of wages now paid to colliers is really not higher than it was fifty years ago, even when the relative values of money are taken into account. In support of this contention it is argued that the miner now produces more than he did—that his labor, on account of increased skill, has become more productive; in other words, the miner of to-day is a more efficient workman than he of half a century back, and therefore earns more than the latter did.

In that country an elaborate set of tables has been prepared designed to show the annual output per man for a period of 30 years. There can be no doubt that, estimated in this way, a very marked increase in the efficiency can be shown; and if it could be made to appear with equal certainty that the improvement is due to greater skill in the men, the case would be satisfactorily made out. The greater productiveness may not be wholly, or even in part, attributable to defter handiwork, but to improved tools, the more extensive use of machinery and better systems of working. That these causes have operated largely in bringing about the improvement admits of no doubt, and it is highly probable that they alone have occasioned it. The employers hold that the gain is due to capital, not labor, and that the workman should consider himself sufficiently benefited by the saving of toil which these superior means occasion, and should not expect an increase of pay for better results of day's labor.

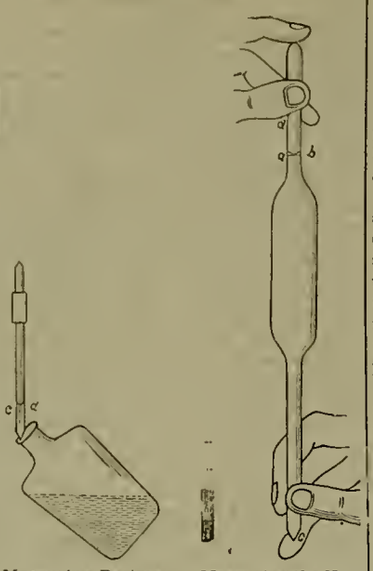
Measuring Solutions in Humid Assays of Silver.

In the PRESS last week we gave an extract from C. H. Aaron's new work on assaying, parts II and III (puhished by Dewey & Co., 252 Market street, S. F.), in which was described the method of standardizing the normal solution in the humid assay of silver bullion. This week, in continuing the subject of the volumetric assay, we take from Mr. Aaron's work what he says about measuring the normal solution, and measuring the decime solutions.

A solution of salt in water is made, of which 100 cubic centimeters will exactly precipitate 1,000 of pure silver, leaving neither salt nor silver in the liquid. This is the *normal* solution. The thousand used in this assay is either 10 grains or 1 gramme—the latter generally. Another solution of salt is made one-tenth as strong as the normal; consequently, one cubic centimeter of it precipitates one point of silver. This is the *decime salt solution*. A decime solution of silver is also prepared, of which one cubic centimeter contains one point of silver; consequently, the two decime solutions are equivalent volume for volume, each neutralizing the other. The cubic centimeter sign is c. c.

In measuring the decime solution a glass *pipette* containing 100 c. c. is used. The accompanying diagram and directions are from Mitchell. "Immerse the jet, *c*, of the pipette in the solution, apply the mouth to the upper orifice, and draw the liquid into *d*, above the circular mark, *a, b*. Dexterously apply the forefinger of one of the hands to this orifice, remove the pipette from the liquid and hold it as represented in the figure. The mark to *a b* is held on a line with the eye, and the surface of the solution allowed to descend until it forms a tangent with the plane, *a, b*. At this instant the jet, *c*, of the pipette is set at liberty by removing the finger, against which it had been pressed, and without otherwise changing the position of the hands, the contents are allowed to run into the bottle appropriated for that purpose (containing the assay) taking care to remove the pipette as soon as the stream stops."

"If, after having filled the pipette by aspiration there is any difficulty found in a sufficiently rapid application of the forefinger to the superior orifice to prevent the fall of the liquid below the mark *a b*, the pipette must be removed from the liquid, the orifice being closed by pressing the tongue against it; then apply the middle finger of one of the hands to the lower orifice, remove the tongue and apply the forefinger of the other hand to the larger orifice, previously wiped dry." The pipette should be rinsed with a little of the solution before being charged, and washed twice with water after use.



Measuring Decime Solution. Measuring the Normal Solution.

The decime solutions are measured in smaller pipettes gauged so that when filled to the mark *c, d*, (see diagram) they allow one c. c. to run freely, the small quantity of the solution remaining in the pipette not forming part of the c c. The decime salt solution is kept in a bottle closed by a cork which is traversed by the pipette firmly fixed in a hole bored for that purpose. The decime silver solution is kept in a bottle closed by a glass stopper. Quoting Mitchell again:

"To measure a thousandth ('point') with the pipette, the bottle is held with one hand and the pipette with the other. The pipette is taken from the solution after its upper orifice has been closed by the forefinger; the lower orifice is then inclined against the edge of the flask to remove the liquid, which without this precaution would remain there. The mark, *c, d*, is then raised to the level of the eye, and by a suitable pressure of the forefinger on the upper orifice, which may be obtained by giving the pipette a slight alternating circular movement between the fingers, the solution is allowed to run out gradually."

"The instant the concave surface of the liquid is at the level, *c d*, the pipette is firmly closed by pressure of the fore finger on its orifice, which is held above the bottle into which the solution is to be poured, and the forefinger removed so that it can be emptied. It is here necessary to remark that in order to regulate the slow and regular runnings of the liquid from the pipette, by the pressure of the forefinger, the latter ought to be neither too moist nor too dry; if too dry it will not perfectly close the orifice, even by strong pressure; if too moist it prevents the entrance of air, and the liquid will not run, or if it does it will be irregularly." This observation should not be lost sight of in the use of the large pipette. As it is often convenient to use several c c of either decime solution at once, the pipettes are graduated from one to five.

The Torsion Balance.

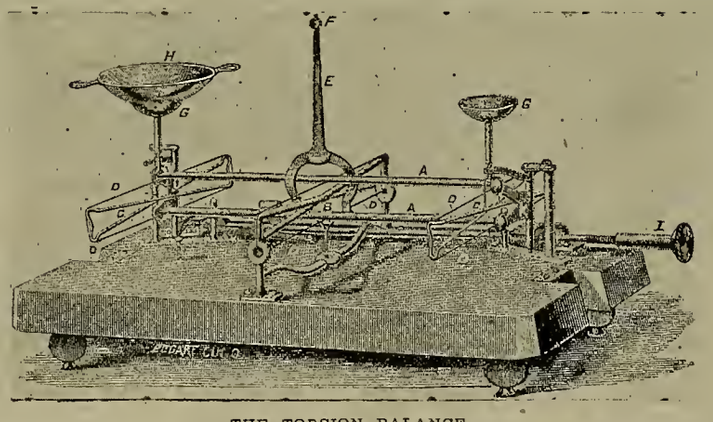
Chemists, physicists and others, whose occupations necessitate the use of fine scales, have heretofore regretted their inability to obtain any which would remain uniformly accurate.

The difference between the theoretical and actual results obtained in the ordinary balance (provided the pivot distances are exact) is mainly due to the frictional resistance between the knife-edges and their bearings. This frictional resistance, although reduced to a minimum in the finest scales when new, constantly increases, thereby decreasing their sensitiveness proportionately,

When examined under the microscope, neither the surface of the knife-edge nor that of its bearings ever appears perfectly smooth. Soft knife-edges are easily blunted, whereas hard ones are brittle and liable to crumble under the effects of over-load or shocks. Prof. F. A. Roeder for many years attempted to discover some means by which the knife-edge could be replaced with some device free from these objections. His experiments convinced him that a torsion-joint was best suited for the purpose. He communicated this conclusion to Alfred Springer, of Cincinnati, and they jointly developed a system which the latter gentleman described before the American Institute of Mining Engineers. A torsion wire had been used for the center of rotation prior to Prof. Roeder's invention, and it was found impossible to replace the terminal knife-edges with torsion-joints.

The use of a torsion-joint introduces a new element opposed to sensitiveness, namely, that of resstance to molecular displacement. In the scales manufactured by these gentlemen, according to size, thin wires of gold, or bands or rods of an elastic material are strongly tensioned over suitable frames (which themselves are thereby strengthened by being equally framed on all sides).

In the engraving, *A*, *A*, is the parallel compound beam. *B*, immovable center frame, carrying index and beam. *C*, *C*, movable frames carrying the pans. *D*, *D*, *D*, stretched gold wires over the frames, acting as central and terminal pivots. *E*, index. *F*, weight for the purpose of elevating the center of gravity. *G*, *G*, cups for pans. *H*, *H*, pans. *I*, arrest. *K*, *K*, support to receive the weight of the scale when not in use.



THE TORSION BALANCE.

The center frame, *B*, being attached to the base of the scales, is an immovable one. On the upper and lower wire, *D*, *D*, of this frame a compound parallel beam, *A*, *A*, is firmly attached. The ends of the beams are similarly attached to the wires of the movable cross-pieces, *C*, *C*. The purpose of the outer cross-pieces which carry the support for the pans is to allow them to descend in a vertical direction, thus keeping exact fulcrum distances. Every part of the system being firmly soldered, the whole construction is in reality but a single piece.

The resistance to molecular displacement is augmented by the tension at which the wires are held, and increases with the angle of displacement. This resistance to torsion is many times greater than the frictional resistance between the knife-edge and its bearings, but differs from the latter in this: that it does not vary with different loads, whereas the friction in the knife-edge increases with the load placed on the pans.

Now, if this torsional resistance be compensated in some suitable manner, it is perfectly evident that it will play no further role in the working of the scales. This nullification of torsional resistance is effected in a peculiar manner which they have found to be perfect for any arc of oscillation used in balances.

As a compensation to torsional resistance, they make use of a "poise," *F*, above the center of rotation, which has no effect upon the twisting of the wire as long as in the center, but according to the laws of gravity has an increasing effect in proportion as it moves from its neutral position. This increasing force in oscillation exactly counterbalances the increasing resisistance to molecular displacement, thus effecting an absolute nullification of the original torsional resistance in the wires when oscillating. The scales are now free not only from torsional resistance, but are absolutely frictionless.

For many purposes it is desirable to have less sensitive scales. When this is the case, the poise is simply lowered until the required sensitiveness is obtained. It has been asked whether the twistiog of the wires does not tend to break them. A careful observation will show that the wires are long and the arc of oscillation comparatively small; furthermore, every molecule partaking in the motion, no part of the wire undergoes much torsion. In fact, it is barely visible. Thus much for the smaller scales.

It will be readily understood that by moving one of the outer cross-pieces toward the center one, and the other away from it, we obtain the common steel-yard with its ends of unequal length; that is, a single multiplying lever, in which the knife-edges are replaced with torsion-joints. Furthermore, if the long end of this lever be attached by a similar cross-piece to the short end of another such lever, we get the effect of multiplying levers as used in platform and other large scales, but with this great difference, that the multiplication of the torsion-joints in contradistinction to the knife-edges does not increase the error due to friction.

All the levers, like the simple scale, act as one piece, and the poise can be placed over every center of rotation, or, if convenient, over a single one. It is preferred to place it over the last one in the system, thus decreasing in size proportionately to the multiplication of the levers. Both large and small scales constructed on this system are extremely sensitive and durable.

A New Concentrator.

Prof. J. E. Clayton, of Salt Lake City, has patented through the MINING and SCIENTIFIC PRESS patent agency an improved machine for concentrating slimes, tailings, sulphurets or other substances in which it is desired to separate the heavier from the lighter portions.

The machine consists in a circular pan having a hollow central cone with vertical slots through which the discharge of tailings may be made. A series of rings fit this cone by which the point of discharge may be raised or lowered; and there is a conoidal diaphram at the bottom of the pan with outwardly inclined perforations or jet-holes, through which water may be forced into the mass to be concentrated. The revolving hopper at the top has pipes which extend downward so as to deliver the material to be concentrated around the inner periphery of the conoidal bottom. The machine has a series of vertical rods having toes or scrapers at the bottom arranged with relation to each other so as to act successively in spiral lines upon the lower stratum of concentrates; and there are exterior slotted outlets for the discharge of the concentrated material, and a flat circular wheel or annular disk fitted to the bottom or lower end of the slotted outlets with corresponding holes or openings. There are means for moving it so as to open or close the outlets. The upward current of water sorts the particles of ore according to their density, the lighter particles rising to the surface and flowing out with the water, while the denser particles resting on the bottom are gradually moved outward to the periphery of the pan and the outlets, by the scrapers, the rotation of the mass, the conoidal or sloping form of the false bottom, and by the oblique action of the inner circle of jets of water. The patent covers a number of details of construction which makes the concentrator more perfect in its action.

Leadville's Ore Shoots.

The Leadville *Herald* makes an interesting comparison between the deposits of that section and the ore as found elsewhere by remarking that in the Leadville district the mineral is generally found in shoots, so called, which possess great regularity and length, and are as a rule easily discovered, when once the plane of contact between the limestone and porphyry is opened. That these ore shoots possess an interminable length is not claimed, but they have been followed and found productive for over 2,000 feet. Their maximum length has never been ascertained, but among the various shoots disclosed, some have been found with a limit to the westward, while others have feathered out and disappeared with depth, or to the eastward. Owing to the numerous faults coursing this section from north to south, displacing the mineral zone, and the imperfect exploration of the contact plane, we are still in the dark regarding many interesting features concerning our ore shoots.

The ore shoots of Leadville, almost without exception, have an approximate north east course, with a dip varying from 10 to 20 degrees from the horizon. The hanging wall or floor of the ore bodies is limestone and concave, like a trough. Could the overlying material and ore be removed the limestone would present somewhat the appearance of a piece of corrugated iron roofing. The overlying porphyry, as a rule, presents nearly a perfect plane. The width of the Leadville ore shoots averages from 25 to 400 feet, and the thickness from 3 to 40 and even 80 feet.

The most pronounced and ideal ore shoot opened in this district is the large one in the Iron mine, and another on Carbonate Hill, passing through the Catalpa, Stars and Maid of Erin mines.

The main Iron mine ore shoot was about 300 feet wide at the surface, and showed a thickness of 5 to 25 feet. It continued with little variation for over 1,000 feet, but after that began to diminish, and at 1,500 to 1,800 feet from the outcrop, gradually decreased in size, and finally lost itself in small seams and stringers. As the outcrop of this shoot is the result of a fault or displacement, it is hy no means the western extremity of this wonderful ore shoot, and how much of it lies huried under the western slope of Iron Hill no one can say.

The great ore shoot on Carhonate Hill, contrary to the Iron Hill ore shoot, is weak at the western outcrop. Where lifted to the surface in the Yankee Doodle and Crescent claims, it is quite thin and irregular, but improves in strength and regularity with depth. Below 800 feet from the outcrop it opens out until it attains a thickness in places of 60 or 70 feet, as shown in the Evening Star mine, and a width of several hundred feet. It continues with almost unabated strength from this point on through the Maid of Erin, Clontarf, Brookland and Wolftone mines, a total distance of over 2,000 feet, as far as yet developed. It has so far yielded over $6,000,000 worth of silver and lead, resulting in a clear profit of over $2,500,000, aud is prohably good for half as much more.

While the above are fair representatives of the great majority of ore shoots in this district, there is another class which is fairly represented by what is termed the "gold ore shoot" in the Silver Cord mine, and less than 500 yards from the great Iron mine ore shoot. The "gold ore shoot" at the outcrop is in the plane of contact, but as depth is gained it sinks rapidly into the limestone floor, and at 700 feet from the surface is 125 feet helow the plane of contact, existing as a continuous chimney of ore of irregular circumference. Its value, so far as we know, has not heen impaired hy depth, and further opening will unquestionahly prove it to he identical with one of the large ore shoots opened in the Louisville or Ruby mines, further to the eastward.

From all that is knowu of the Leadville ore deposits, it is reasonahle to conclude that but for the interruptions occasioned by displacements of the ore plane, continuous ore shoots would bc disclosed, having a length of 3,000 to 5,000 feet.

The ore shoots ahove described are the principal ones so far discovered. There are probably 50 to 100 others in this district. For instance, the large Carbonate Hill ore shoot is flanked hy three paralleled shoots to the north and prohahly half a dozen to the south, all presenting the same general characteristic, but inferior in strength. The same is true with the Iron Hill belt. In this section, between the Crown Point and Iron mines, which are nearly a mile apart, a score or more distinct shoots of pay ore have heen opened, several of which are nearly as strong as the great Irou mine shoot.

THE PRECIOUS METALS.—Burchard, Director of the Mint, in his special annual report on the production of gold and silver in the United States for the calendar year 1884, which has heen ordered printed, estimates the production of the country to have heen as follows: Gold, $30,800,000; silver computed at the silver dollar coining rate, $48,800,000, total $79,600,000. This shows an increase over the yield of the previous year of ahout $800,000 in gold, and $2,400,000 in silver. The total deposits of gold at the mints during the year amounted to $50,518,179, of which $30,807,200 was reported as domestic. The exports of gold hullion, exclusive of United States bars, amounted to only $115,000.

To the amount deposited at the mints and the small amount exported might properly he added the $600,000 worth of gold contained in the silver hullion exported, and also possihly $700,000 undeposited gold in the form of nuggets, grains, etc., used in ornamentation and $200,000 in hars in private refineries used for similar purposes, which make in all an addition of about $1,500,000, hut of the gold received from British Columbia and northern States of Mexico, amounting to $1,100,000, only $400,000 was deposited at the San Francisco Mint as foreign, and the statements furnished hy refiners show that it was refined hy them and included in the refined hullion deposits at that mint under the head of domestic.

Mine Managers.

The Leadville *Herald* speaks to the point on the subject of mine managers when it gives the experience in that camp: Many a hright and able miner has participated in the discovery and development of Leadville's great mines, and scores of conceited and ignorant tenderfeet have injured this district and hrought our system of mining into disrepute. In spite of all the commendable work done here it is douhtful if the district would have withstood the onslaught of egotistical, pumpkin-rolling mine-managers, but for the fact that the ore is all found near the surface, and easily extracted. In the early days of Leadville almost every trade and profession was represented in the list of mine managers. We recall distinctly among the men in charge of prominent mines, doctors, lawyers, hankers, ranchmen, printers, merchants, hrokers, railroad engineers and mining engineers. We place mining engineers at the end of the list, not hecause they were least in numher, but that they were in the minority, when they should have constituted 90 per cent of the persons in charge of mines. With such a galaxy of unique talent is there any wonder that this district is covered with abandoned shaft-houses, and that the hills are honeycombed with shafts and tunnels sunk in ineligihle places.

It was a mining engineer that gave the Chrysolite mine the Roherts shaft, from which millions were extracted, and it was a printer that directed the sinking of the Daily shaft on the Little Chief claim and erected large buildings and machinery after the mine was practically exhausted.

The inflated ideas of a little assayer are responsihle for nearly a dozen ungainly barn-like shaft-houses on two claims on Carhonate Hill, and the want of sufficient knowledge to erect suitahle buildings accounts for the miserahle sheds on other claims.

Familiarity with the work in hand gave the Iron mine working inclines in the beginning, through which it worked out its entire territory and half of its neighhors, while ignorance is responsihle for six or eight shafts sunk on another property, and yet there is no working avenue through which ore can be hoisted economically.

But for the introduction into this camp of a culinary artist as a miner Iron Hill would not now have a shaft sunk through quartzite into the granite, and to the zeal of a shoemaker is to he credited the driving of tunnel in barren rock for hundreds of feet into Ball mountain.

At present a great improvement is noticeahle in every direction, and those mines that are not under the control of mining engineers are in charge of persons who have had from three to seven years' experience at mining, and consequently are familiar with the geology of this district and the first rudiments of mining. As a consequence the exploration work of our mines, as well as the surface improvements made in the last few years, are far more practical and valuahle than those made years ago. Our present mining men have profi ed hy the experience of their predecessors. Expensive experimental work has ceased, and approved methods and systems of working have taken the place of the wild hap-hazard operations of the early tender-foot.

Nevada Mines.

The Candelaria *True Fissure*, Nevada, in speaking of hetter times in the claims south of that place says: A supplement to the flattering returns from the mines north of here, and in this county, is added hy those situated at and near Silver Peak, ahout forty miles south. The little 5 stamp mill near there has been running nearly two months on gold ore from the Drinkwater mine, and two shipments of hullion have beeu made. The first was valued at from $1,600 to $1,800, the second reached nearly $2,500. John Chiatovich leased the mine late last year and associated Alex. Palm with him in the enterprise. The property helongs to the New York and Silver Peak Company, hut to the two parties mentioned belongs the credit of the success now heing made. The mill bas beeu thoroughly overhauled and many new parts added in the way of repairs. It is now under the supervision of Fred Vollmer who understands working the ore, as is seen by the fact that the last hatch of hullion was produced from 90 tons of ore. Sounds of activity are also heard from the mines in the vicinity of Alida Valley, and a renewal of working the State Line mines may be anticipated.

Ore Producers at Eureka.

When one considers the few men employed in the mines of the district, says the Eureka *Sentinel*, and consequently the small amount of prospecting and other work heing done, he cannot hut appreciate the shipments of ore now heing made to the Eureka Con. and Richmond Reduction Works and also the merit and actual worth and value of the mining properties immediately around us.

During the past few days the Friday and Hamburg mines, adjoining properties on Prospect mountain, have made shipments ot good ore to the Eureka Con. Works. The former sent in 14 tons and the latter 28. The Hamhurg also sent to the Richmond Works 13 tons. The Lord Byron, which is also located in the same section, sent to the Richmond Works 44 tons. None but tributers, we believe, are working in the property, and all are said to he doing hetter than if they were working for day's wages. The Ione sent in 3½ tons of ore to the Eureka Con. Works, and the Battery and Bay State, the two latter properties located in Newark, made shipments of 10 and 11¼ tons respectively. Some tributers in the Bay State also sent to the Richmond furnaces 11½ tons. Several Secret Canyon properties have also made shipments of ore, among them the Uncle Sam, which sent in 3 tons and the Irish Imhassinder 5 tons. The latter shipment of ore is of a good quality, and will pay handsomely those to whom it helongs. The Rescue mine, a Silverado property, shipped 10 tons, some of which is very rich. The Macon mine on Adams Hill is again producing high-grade ore, and during the week it sent to the Richmond Works 15 tons. The Williamshurg, also located there, sent in 12½ tons. Thus it will he seen that, notwithstanding our camp is undergoing an unprecedented depression, mining in our midst is hy no means suspended. The district never had more producing properties than it has today, and when one considers the very few men employed either on wages or the tribute system, he cannot but feel hopeful of the future. Eureka district has tbe wealth, and all it needs to hring about a prosperous state of affairs again is a few good practical capitalists who will develop and cause to produce some of our many idle properties of merit and worth.

The Larger Mines.

The Eureka Consolidated mine is reported at the office of the company here to he looking well. The various pitches producing ore are holding out, in many cases, much hetter than it was expected they would, and were it now possible to reduce the ore at their works as it is produced at the mine the yield of hullion would undouhtedly astonish many. As it is, much of the ore will necessarily have to remain at the mine until the new furnace, which is fast approaching completion, disposes of some of the 2,500 tons now mixed and stored away for reduction. The Richmond mine continues idle. Manager Probert is in town, and while we have not learned definitely of his intentions as to the resuming of work in the company's properties, yet it is the general belief, and it is so reported, that a number of men will he put to work in the mine shortly on day's wages, and that their furnaces will again he fired up a week from to-morrow.

New Enterprise in Nevada.

Notwithstanding the doleful predictions of the croakers, men of capital and understanding appreciate the resources of Nevada generally and of Esmeralda county in particular, as is shown hy the fact that a syndicate has heen formed in England for the purpose of doing extensive work at Candelaria. A company has heen incorporated under the name of the "Candelaria Water-works and Milling Company, limited," and bas purchased the property of the White Mountain Water Company, also the mill-site and other property, exclusive of the mine heretofore owned by the Princess Mill and Mining Company. This company intends to confine itself strictly to milling custom ores and will purchase no mining property or engage in any mining operations on its own account.

Another English company has heen organized, and has purchased the Princess Mine, upon which a numher of miners, to he increased about May 1st, have already heen set at work. Colonel W. J. Sutherland, F. R. Behr and R. E. Doren, who were mainly instrumental in engaging the interest of the English capitalists in the above-named property, made a friendly call at the *Bulletin* office last Friday, and during the conversation the reporter gathered the foregoing, and also that work on the mill will he begun on or hefore May 1st, and that everything will be done on an ample scale and in the most complete manner. As it is contemplated entirely for custom rock, it will he so arranged that ores from different mines can be worked separately, yet at the same time. Operations will not necessarily he confined to ores in the immediate vicinity of Candelaria, as the company is prepared to put up any class of works and at auy place in the county, where sufficient ore can be shown.—*Walker Lake Bulletin.*

POTATO hlight is doing great damage in the neighhorhood of Halfmoon hay.

Dangerous Lubricants and Mysterious Mill Fires.

A correspondent of the *Railway Age* furnishes some important suggestions under this head from which we condense as follows:

Much has heen said and written ahout explosions in flour mills and spontaneous fires in saw-mills and factories, hut little has heen thought of a suhject which in more than nine cases out of ten has heen the real cause of these otherwise unaccountahle occurrences.

Visiting mills and manufacturing estahlishments, the attention is at once attracted to the clean and orderly appearance of some and the unclean and untidy condition of others; the comparatively even running of the former and the frequent stoppages, accidents, loss of time and danger of fires at the latter.

Close investigation will show that the main cause of this is the result of using poor and highly inflammahle lubricants.

When we consider that lubricating means the interposing of substances hetween the parts in motion, to ahsorh the frictional heat and transfer it into space hy radiation, thereby avoiding ahrasion and heating of the parts, we must see that only such lubricants will be able to accomplish the desired results which are entirely free from inert matter (grit), possess sufficient viscosity to secure adhesion to the metal, and be of such fire-test as to secure radiation proportionate with the heat-absorbing quality of the lubricant.

The injuries resulting from the use of poor lubricants will not always he perceptible at once, hut they are produced gradually and persistently. The hearings of the machinery are tell-tales of the quality of the lubricants used.

Most of the cheap lubricators are made from the residuum of petroleum stills which has heen steamed and settled, thereby separating some of its gritty components, hut much of the latter, mostly in the form of charred products, remains. These residuums are skimmed out to consistency for lubricating purposes and mixed with the cheapest kinds of natural oils with all their higher and inflammable products and frequently even henzine is used. Frequently these oils are mixed in so coarse a manner that when at rest the heavy residuum will separate in the packages underneath the lighter fluid oil and the danger of using such oils is apparent.

In cold weather and when first poured on to hearings some of these oils have an apparently good body, hut in warm weather and in warm places they soon thin out, and in flour mills where it is distrihuted in close rooms over hundreds of hearings it spreads diminutively over adjoining wood-work and floors, it evaporates rapidly and its inflammable vapors mingling with the close atmosphere highly saturated with floating flour dust, form explosive combinations which a single spark, produced hy the accidental getting in the mill of even the smallest piece of iron, will explode. In saw-mills also, where pillow-hlocks, the surrounding wood-work, the flour and saw dust are saturated with such oils, and where on hot days the rising vapors can he seen, a flying spark from the rapidly revolving saws is all that is needed to set the whole place instantly on fire.

THE MINES OF BERNICE AND COTTONWOOD.—E. C. Asher, of Lovelock, writes that he has just returned from a trip to the Bernice silver mine and the Cottonwood nickel mines. He tells the *Silver State* that while at Bernice Superintendent Williams showed him around through his mine, and, so far as he is capahle of judging, it is in excellent order. In the new stope the ore, without sorting, mills on an average $100 per ton, and there is enough of it in sight to run the mill six months. A winze is being sunk from the tunnel, in which the ore is of the same character as in the stope." Work has been commenced on a new tunnel, 160 feet below the present working tunnel, to tap the ledge. This tunnel will be about 600 feet long, and it will open up about $250,000 worth of ore.

At present there are some forty men at work in the mine, some of whom are extracting ore, and others are prospecting ahead. The mill is running steadily and works about eight tons a day with five stamps. Another shipment of about $16,000 in bullion will be made this month.

At Cottonwood Canyon the nickel mines are looking splendidly. There are two mines heing worked. One is owned by the Nevada Nickel Company and the other hy George Lovelock, and hoth are producing rich ores.—*Nevada State Journal.*

THE GALENA MINES.—The prospect for a lively little camp at Galena this summer is good. There are some five or six mines working that are taking out ore on an average of three tons daily to the mine, says the *Central Nevadan*, which assays from $100 to $300 to the ton. The machinery for the new mill under course of construction hy B. F. Wilson arrived this week, and will he speedily put in place, and when completed the mine owners will he ahle to get their ore reduced at home, which will he a great convenience, as well as a saving of money. Mr. Wilson bas stayed with the camp for many years, striving to develop the rich mines that he knew existed there, and he is now reaping the reward for his persevering labors, for it is an assured fact that there are mines in Galena that will pay to work.

ENGINEERING NOTES.

Ancient and Modern Engineers.

Engineers of to-day, says a contemporary, are apt to boast thnt no work of the ancients can compare with their railways. It is not quite certain that this honst is strictly correct. The roads and bridges snd aqueducts of the Romans will, hy many, be considered as greater works than these railways. What moderu cngincer or architect, or both combined, has brought the branch of a river from a rocky gorge in the hills, 40 miles off, where the water is generally clear and never fails to supply nny of our moderu cities, as the architect-engineers did to supply Rome? This water was conveyed in a stone pipe, 5 ft. high and 2 ft. wide, by a gradunl, gentle descent, sometimes on the top of a lofty bank hy the side of the river (Anio, from which the water was taken) when its course was sufficiently directed from east to west; but at intervals the line of tho river had to wind considerably to the north or south around the base of a hill; in those cases the engineers pierced their pipe through the foot of the hill sometimes for two or three miles, until it met the bed of the river ngnin; then, when they had arrived at the foot of the hills, on the level ground called the Campus Romans, in which Rome stands and through which the Tiber winds its course, they carried their stone pipe, called a specus (because it was at first a subterranean), upon a magnificent arcade five miles long, varying in hight according to the level of the ground, gradually emerging from the hill on a level at first, snd then arising sometimes gradnally, sometimes suddenly to a hight of 40 ft. or 50 ft., where they had to cross the small streams that run across the country. And this arcade was either built of stone or faced with stone almost throughout.

The specus of Claudius is carried on an arcade of cut stone; that of Nero, which is on the top of that of Claudius, is faced with the beautiful brick-work of his time, the finest brick-work that has ever been made. The celebrated aqueduct hridge called the Pont du Gard, in the south of France, is a Roman work of the third or fourth century, with a carriage road hy the side of it, as was usual with aqueduct bridges. When our engineer-architects have supplied our city with water as abundantly as Rome was supplied in the second or third centuries, and can show as fine brick-work as that of Nero, they may pretend to rival the engineer-architects of ancient Rome, hnt not hefore.

BELGIAN SYSTEM OF CANAL TOWAGE.—The system of towing canal hoats known as the Belgian system may he briefly dcscribed as follows: A stout wire rope or cahle is lsid down in the hed of the cnnal. Each hoat is provided with a device called a "clip pullcy" or drum, consisting of a lnrge pulley having its periphery provided with a series of closely-set moveahle jaws. These jaws form together a practically continuous groove, into which the wire rope will fit suugly, and they are pivoted in such a manner that any pressure hrought upon the bottom of the groove will cause the upper portiou of the jaws to close tightly nn the object making the pressure, and the greater the pressure the tighter will the pulley grip. Each hoat, as ahove stated, is provided with one of these automatic gripping pulleys, which is situated at the how. It is set in motion at a regulated speed of rotation, hy a stesm-engine, with which the hoat must also he provided. When it is desired to propel the hcat the cable is fished up from the hed of the canal, placed in the groove of the clip drum and the engine started. As the drum rotates the cable is pulled up at the bow and paid out over the stern, falling again into the bcd of the canal behind the heat. The latter is thus pulled alcng on the cahle. It is apparent that one hoat furnished with an engine and a clip drum may have in tow several loaded hoats of the ordinary kind. The system is exceedingly simple, practical and economical. It is extensively used in Belgium and other European countries, snd is generally beld hy enginccrs to he the best solution of the problem of steam towage on canals that has thus far been proposed. The great difficulty with all other systems employing independent means of steam propulsion, is to avoid the dangerous washing of the hanks.

THE VANNE AQUEDUCT, FRANCE.—The Vanne aquednct, France, which is seme 37 miles long, is said to he the most important and costly work that has ever been constructed of artificial stone. This aqueduct, whicb supplies the city of Paris with water, traversing the forests of Fontainbleau its entire length, comprises 2½ to 3 miles of arches, some of them as mucb as 50 feet in hight, 11 miles of tunnels, and 8 or 10 bridges of from 75 to 125 feet span for the hridging of rivers, canals and highways.

ALVORD MILL.—The addition of a Huntington centrifugal mill to the Huntington 2-stamp mill already in place at Camp Cady, has been completed and the entire mill was set in operation the other day, and is now running smootbly and satisfactorily. The mill is now equivalent to a 10-stamp in capacity and can crush 30 to 40 tons of ore per day. There is an abundance of water and fuel for the mill. The work in tbe Alvord gold mine, seven miles from the mill, is progressing, and the ore is being hauled to the mill daily.—*Calico Print.*

USEFUL INFORMATION.

Old Telegraph Wire.

What Becomes of the Miles of It Worn out Every Year.

"We exchange at the rate of an eighth of a cent per pound about 100 tons of old and rejected telegraph wire overy year," said the superintendent of the construction department of the Western Union yesterdsy. "We huy nothing but the best Ex. B. B. galvanized telegraph wire No. 8, which costs us from seven to eight cents per pound, sixteen feet to the pound. From fivs to seven years we calculate as the life of a wire, but oftentimes have been compelled to replace them in less time, owing to being poorly put up hy the climbers, and where the wire joins the cross-har rust will ensue. In a climate like ours the wires will last much longer than where the air is continually moist, as is the case in the lake region or along the sea-coast. Wires strung along the coast sre often found encrusted with n salt deposit, which in course of a few years will cause much trouble to the operators, and if a storm occurs the weight upon the wires will cause hreakage to ensue, which is often charged to the severity of snowstorms.

"A wire when once cut, as is often done hy the fire department to hasten the erection of their ladders, is easily joined togetber, but we always consider such a wire defective and to these first do we look when trouhle is reported."

Superintendent Kennedy of the Baltimore and Ohio service said they usually exchanged ahout 40 tons of wire every year. "The owners of wire-mills will not buy it, hut will exchange with us, allowing hut an eighth of a cent per pound. I don't know what use they make of it."

"The first wire erected for telephone purposes," said Manager McAleer, of the Bell Telephone Company, "was No. 16, or the thickness of the thirty-second part of an inch, and it wore well for ahout a year, but heing easily rusted was replaced with the ordinary teleg aph wire. You will, no douht, find the former lying upon the roofs of many houses throughout the city, our workmen not taking the trouhle to remove it. As yet we have not sold any old stock, but if we find a purchaser will let him have it cheap."—*Phila. Times.*

DO SAW TEETH SAW?—It is a very interesting study to observe the effects of high cutting speed in saws and moulding machines, hut it must be very mysterious to the observers who advocate that it is not the teeth that saw, but the air that is confined within the spaces when driven at a great velocity. It makes a very pleasant theory and gives the disbeliever a chance to disprove it. The circular saw when in motion gathers a quantity of air between each tooth and completely protects them as if plated with steel, and will glide through the hardest oak cutting a clesn skerf, the particles of air serving as a cutting edge, hut it has not been explained why the saw needs filing. It would seem, according to this theory, that all that would be needed would be to let the saw rest a moment and give it a chance to ventilate itself and get a new supply of fresh air within the teeth; or perhaps this gaseous fluid works hoth ways, since action and reaction are equal, and removes the edge on the saw tooth, leaving the impression that it is the silicious impurities in the timher that wears away the teeth.

POWDERED ASBESTOS can be used advantageously for making an enamel or coating for walls, pipes, etc. The powder is mixed with soluhle salts, such as silica'e of potash, and mineral or other colors which combine with silicic acid, so as to form a product which resists the action of oxygen, heat, cold or damp. The coating furnishes a refractory glaze which protects the material it is applied to, whether wood, gas or water pipes, and stone or hrick huildings. When applied to masonry or wood the surface of these is first washed with soap and water. In preparing the enamel the refuse ashestos only need he employed. It is also proposed to apply the coating to hoilers in order to protect the plates against a too intense fire.

TOUGHENING TIMBER is a new process hy which it is claimed that whitewood can be made so tough as to require a cold chisel to split it. The result is reached hy steaming the timher and submitting it to end pressure, technically "upsetting it," thus compressing the cells and fibers into one compact mass. It is the opinion of those who have experimented with the process that wood can be compressed 75 per cent., and that some timher which is now considered unfit for use in such work as carriage huilding, could he made valuahle by this means; and more especially since the rapid consumption of our hest ash and hickory will sooner or later render some suhstitute necessary. —*Wood Worker.*

PASTE FOR ENGRAVINGS.—To make a paste that will not draw engravings when pasted down on paper, use a thin paste. A mixture of gum tragacanth and gum arahic forms with water a thinner mucilage than either of these two gums alone. Rice flour is said to make an excellent paste for fine paper work. A solution of 2½ ounces gum arabic in 2 quarts of warm water is thickened to a paste with wheat flour; to this is added a solution of alum and sugar of lead 1½ ounces each in water the mixture is heated and stirred until about to boil, and then cooled. It may he thinned with a gum solution.

TO BLEACH FLANNEL.—Flanuel whicb has become yellow with use may be bleached hy putting it for some days in a solution of hard sosp, to which strong ammonia has been added. The right proportions sre one pound and a half of hard curd sosp, 50 pounds of soft water and two-thirds of a pound of strong ammonia solution. The same ohject may he attained in a shorter time by placing the flannel for a quarter of an hour in a weak solution of hisulphate of sodium, to which a little hydrochloric acid has been added.

CLEANING POWDER FOR SHOW WINDOWS.—A good cleaning powder which leaves no dirt in the joints, etc., is prepnred by moistening calcined magnesia with pure henzine, so that a mass is formed sufficiently moist to let a drop appear when pressed. The mixture is to he preserved in glass hottles with ground stoppers, in order to retain the easily volatile henzine. A little of the mixture, when to hs used, is placed on a wad of cotton and applied to the glass plate. It may also hs used for cleaning mirrors.

PLUMBAGO IN A NEW ROLE.—It is said that a Frenchman has devised a process of giving to felt a slight coating of plumhago or metal, hy which the appearance of burnished steel, copper, bronze or silver may he imitated. The product is likely to prove very useful when applied to stage properties, as hesides heing inexpensive it does not materially increase the weight of articles treated with it.

URANIUM PHOTOGRAPHY is becoming popular in France. The salts of the metal are gold, green and grcenish hrown, and in thin layers produce very delicate tints. For photographing forests and landscapes they are superior, giving pictures that are nearly perfect reproductions of nature.

GOOD HEALTH.

"I've Been Thinking" Series—No. 5.

[Written for the PRESS by JEWELL.]

How to Become Beautiful.

Natural heauty, whether in plants, animals, or in men and women, is the grand external sign of perfectness of organization and integrity of function. In the proportion that we approach physical perfection do we hecome physically beautiful? As Dr. Pritchard truly says: "The idea of heauty, heing synonymous with health and a perfect organization." Deformity of limhs always shows a want of perfection in the locomotive system, or muscular development; a had complexion indicates weakness or disease of the nutritive system; a dyspeptic stomach or diseased liver records its condition on face and form, in angular lines, sallow complexion and other well-known signs, all detrimental to physical beauty. Health, then, is indispensible to and one sign of heautv. And shall we not, by studying its laws and obeying them, he laying the very foundation of physical perfection? Health is dependent upon certain conditions—which we may or may not be ahle to control; hut all should strive to attain such knowledge of their own deficiencies and needs as to he able to maiutain perfect, harmonious vital action.

The essential needs of health demand a sound physical organization, a vigorous snd well-balanced mind, a right use aud constant supply of all elements needed for the hody—such as pure air, sunlight, food and drink, sufficient physical exercise, rest and sleep, cleanliness and proper temperature, with harmonious social relations and the equal distrihution of clothing over the body for comfort and freedom of motion. Also an avoidance of whatever conditions aud habits are harmful.

Perfect physical heauty demands, also, ease and gracefulness of motion. These may be natural, or cultivated, hy giving free play to every muscle of trunk and limh.

Tight dressing is particularly ohjectionable, whether of the waist, limhs or feet, not only hy destroying the harmony of proportions, hut hy unhalancing the circulation and retarding the free play of muscular action. The Venus de Medici is considered the most perfect model form of female heauty, aud has heen the admiration of the world for ages. Alexander Walker, after minutely describing this celebrated statue, says: "All these admirable characteristics of the female form, the mere existence of which in woman must, one is tempted to imagine, be even to herself a source of ineffable pleasure, these constitute a heing worthy, as the personification of heauty, of occupying the temples of Greece; present a finer ohject, alas! than Nature, even, seems capahle of producing, and offer to all nations and ages, a theme of admiration and delight." Every home should he adorned with a copy of this charming statue, as well as that of the Greek slave. The study of such outlines of beauty of form would tend to correct the errors and fashion foihles we are so surrounded with. These forms are such as unperverted nature and the highest art alike require. To compress the waist, pushing in the ribs and displacing the vital nrgans, is ss destructive to beauty as to health.

It was *possible* of the All-Wise Creator to make the human form the shape of an hour-glass, with the ribs running up and down, as fashion would have them and modern corsets make them, hut *He did not*—nnd may we not trust thnt He knew hest, and doeth all things well?

Something more than mere external beauty is required to fully satisfy the heholder. The eye must beam with intelligence, truth aud purity—yea, and love, too, which has the power of illuminating even the plainest face aud form with heauty.

"There is a continual relation," Riofrey says, "between the hody and the mind; slavery, vice and ignorance brutalize the features; virtue, independence and knowledge ennohle them. How hideous is the countenance of an ignorant, vicious man! How admirable is that of an honest man, enlightened hy knowledge and science!"

Those who desire to acquire and retain a high order of beauty, therefore, must keep the intellectual powers in healthy activity. I recall to mind a friend of long ago, whose face was positively ugly; only two redeeming points of beauty had she—her hair, which was glossy and ahundant, and the shape of her head—which was elegant and classic. She was more than ordinarily intelligent, with good conversational powers. Indeed, she was a charming compsnion, and when under the spell of her conversation I have actually *felt* the beauty I knew was not there—except the *spirit* of it that illuminated the face.

Looking back, at this age, I verily believe that had she not lacked the *vital* essence of heauty itself—that of the spirit—had she been true, pure and healthy, as well as intellectual—she might have overcome the deformities of face and form and been as really heautiful as she was charming.

It is hardly possihle to speak or think of a person as homely who is unselfish, wise, pure and good. The inner, spiritual beauty gleams through from hehind the features, and transfigures them with a divine expression. Honesty, purity and goodness have their true facial expression, and like loving, kindly actions, win our love and admiration in return. It therefore is needful for us to cultivate moral goodness, serenity of temper, and obedience to the laws governing our spiritual heing, if we desire physical heauty of the highest type. I extract from Jacques' "Physical Perfection" this recipe: "To acquire a beautiful form, take ahundant exercise in the open air—free, attractive, joyous exercise, such as young girls when not restrained hy false or artificial proprieties are wont to take. If you are in the country or can get there, ramble over the hills, and through the woodlands; hotanize, geologize, seek rare flowers and plants; hunt birds' nests and chase butterflies. Be a romp, even though you are no longer a little girl. If you are a wife and mother, so much the hetter, romp with your children. Attend also to your bodily positions, in standing, sitting, lying and walking. Live while indoors in well ventilated rooms; take sufficient wholesome and nourishing food at regular hours, keep the mind active and cheerful—in short, obey all the laws of health."

In conclusion I add, to promote heauty, cultivate health of body, mind and soul. The greatest good embodies the greatest beauty, and is attainable only and always through correct living and nohility of thought and action.

Deer Ridge Farm.

NEVER STAND AT THE FOOT OF A SICK BED and survey the patient. All figures loom large to fevered eyes, aud by the side of the hed are only partially seen, and do not annoy with the sense of too much presence. Do not open the door very slowly, for then the attention is strained, speculating as to who the next comer can possibly he after all this preparation and with such cautious approach. Low but clear tones, quiet hut sure movements, and rapid rather than slow, are a great relief to any patient who is hlessed with a practical nurse. Whispering is torture. Silence is best until you can discuss matters in another room; hut if you speak, speak out, and make no mysteries ahout anything. In severe illness the nurse must watch her patient steadily, but not seem to be looking. In convalescence it frequently sooths the invalid to have the nurse seated at the window apparently looking out. This frees the faculties from the tension that the sense of heing watched usually gives.—*Hall's Journal of Health.*

COFFEE ADULTERATIONS.—Only 13 out of 91 samples of coffee analyzed during one month in Paris were pronounced pure. One specimen package is reported to have contained the following ingredients: Red earth, flour, coffee grounds, caramel, talc, plumhago, vermicelli, semolino powder, bean-dust, carrots, hread crusts, acorns, saw-dust, red ochre, hrick-dust, ashes, mahogany shavings, vegetables, earth and sand.

VACCINATION.—Singular to say, there are many well-informed people who inveigh against vaccination as a preventive of small-pox. The facts of history are convincingly against them, however. The latest vindication of vaccination comes from Durham, England. There were 103 cases treated at the hospital, of which ten were fatal. Of those who died not one had heen vaccinated. Of the other 93 not one had heen revaccinated.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE BOSS NUGGET.—Amador *Ledger*, May 2: One of the finest nuggets ever surrendered by the placers of Amador county was taken from the gravel claim of James Hall, located on Grizzly Hill, about 2½ miles from Volcano, on Friday last. It weighed 30¾ ounces and 12 grains. It is a solid mass of gold, not a particle of quartz is mixed with it. Such gold sells at $18 per ounce, so that the value of this nugget is $540. Three other chunks were also picked up on this claim lately, having an aggregate value of $300. In two weeks the owner of this splendid property has taken out 80 ounces of gold, worth $1,500. Such returns rival the palmiest days of this mining camp. Indeed, Volcano is decidedly on the improve as a gold producer.

VALPARAISO.—Important developments have been made in this quartz claim this week. The mine adjoins the Mammoth on the north. Some of the richest deposits of gold-bearing metal met with in the Mammoth have been taken not far from the Valparaiso boundery. This fact encouraged the owners of the latter claim to run a prospect tunnel north toward the Mammoth, in the hope of striking the same golden seam. This tunnel was started from the gulch, and after pursuing a straight course for 25 or 30 feet, a curve was made so as to keep in soft rock if possible. Beyond this point of curvature the tunnel has been run a considerable distance without material results. A few days ago E. Ginnochio, one of the owners, resolved to commence a cross-cut east at the point of deviation from the straight course, only 25 feet from the mouth. After blasting 2 or 3 feet, a seam of greenstone quartz was encountered, carrying the same kind of black metal for which the Mammoth is so famous. A large block of the ore was brought to Jackson Wednesday morning, one of the first pieces blown out. A chunk of the rich metal is readily detected by those acquainted with the ores of that district. This strike is over 800 feet north of the place where the Mammoth mine is being worked, and the conclusion is irresistible that the gold-bearing vein continues the whole of the intervening distance.

MISCELLANEOUS.—The Median near Amador City continues to develop strongly; the ledge is said to be 20 feet wide in places, and believed to be of paying grade. The shipment of gold sent by the St. Julian lately realized over $2,700 by Mint returns. Since this shipment the mine has surrendered over $800 more. Last Monday the Keystone mill was stopped to enable the reservoir to be cleaned out. Sediment accumulates to such an extent as to necessitate a washing out about every six months. In places the mud is from 10 to 15 feet deep. The cleaning out process consists in running a full head through the reservoir. In a few hours the entire lake of mud is washed into the creek.

SUTTER CREEK.—Cor. Amador *Ledger*, May 2: Rumors are afloat of new developments in the McIntyre mine; the rock is reported to be improving in quality. It is also reported that the Mahoney Company are negotiating for the sale of the property to a wealthy English company.

FRENCH CAMP.—The mining claims of the little camp on the Cosumnes river, 3 miles above Grizzly Station, are all running full blast, with abundance of water. Some of them are said to be yielding well, others are barely paying expenses. H. Wilson is prospecting on his iron mine. There is a large body of ore in sight, some of which has the appearance of pure iron. When the ore is heated in a crucible the metal runs out in a stream. By the side of this ore body, there is a fine stratum of mineral so hard that a common grindstone will make scarcely any impression on it. It is capable of receiving a high polish, and will cut glass, it is said, almost as readily as a diamond. There might be something of great commercial value contained in this rock. Mr. Wilson says his mine is worth $100,000 when properly prospected. It is partly in Amador and partly in El Dorado county.

El Dorado.

COUSIN JACK.—*Mountain Democrat*, May 2: O. F. Eaton passed through town yesterday on his way to the Bay with some fine samples of ore from the Cousin Jack mine, near Brownsville. The mine will soon be started up and thoroughly prospected.

BOULDER MINE.—The Boulder mine, in Coloma township, is looking better every day. The mill is kept constantly at work, and the rock being crushed gives every promise of a permanent ledge.

CONTRACT COMPLETED.—Owen Roberts, Thos. Moyle, John Pasco and Edwin Bill have completed their contract for sinking 50 feet further on the Old Hickory mine, and have had a settlement.

Inyo.

DARWIN.—Inyo Co. *Register*, May 2: Gorman & McKenzie are working at the old Custar mine, in which a new ore body was lately struck. The Lucky Jim is being steadily worked.

PINE TREE AND A. K. B.—Messrs. Eldred & Hedge are working these mines which they leased from Alexander, Kehoe and Barnes, with good results. These are both extensions of the White Hill mine.

COPPER QUEEN.—The Copper Queen is one of the late discoveries in Russ district, being so named from the fact the mine when first opened showed good copper ore. It has, however, on further development changed to lead ore, 75 oz. silver, 65 per ct. lead. The pay streak is 3 in. wide; traceable 500 to 600. feet

THE OLD UNION.—Reynolds & Treglown are working steadily away on this property. The shaft is down 160 feet, a drift is now being run. Some 20 tons of ore are ready for shipment. Assays run on the average 55 oz. silver, 52 per cent lead and $7 in gold.

ESPERANZA.—A new strike has been made in the mountains east of Lone Pine, on the Hunter Canyon trail. The mine is situated on the extreme summit. Elies & Lopez are the locators; an incline of 30 feet has been run. The rock bears gold.

WANTED.—Should the Russ district mines continue their present favorable showing, of which there seems to be no question, a custom furnace situated on the river somewhere in the valley will become almost a necessity. One such, if properly managed, would be worth as much to its owner as any mine.

LUTRA.—This old mine—which may not be recognized by its present name—is now being worked by Messrs. Harvey & Speer. It is situated in the foothills opposite Lone Pine, about one and a half miles distant from the railroad station. The ledge is wide, the ore assaying from 65 to 300 oz. silver, and 35 to 48 per cent lead. The tunnel is now in about 33 feet.

VICTORIA.—The Victoria, on Santa Rita Flat, east of Independence, has lately been worked by Phil. Cartier and John H. Gray, but so much water was met with in the shaft as to stop furthur progress. The ore is free gold bearing, and the average width of the pay streak is 10 inches. The shaft is down about 40 feet. Measures will be taken to drain the mine, and resume work.

WHITE HILL.—At the White Hill mine indications continue as favorable as heretofore for a continued and steady output. At the end of the tunnel, about 35 feet, the ledge is from 1 to 2½ feet wide, and late assays prove the ore to be even richer than at first. About 27 tons of ore are now on the dump.

RED HILL.—Jack Welch, Pat. Downs and Matt. McDonald have made a new and promising strike in Russ district, three-fourths of a mile south of the White Hill, and have named it the Red Hill. No assays have yet been made, but competent judges say the ore will go fully as high as that in the White Hill, The ledge shows up strong and wide on top, and croppings are plain for more than 600 feet. A shipment of ore will be made about June 1st, if lead is found in sufficient quantity before.

BEVERIDGE.—Lasky's mill at Beveridge was lately closed down. It has been running on Keynote and custom ore. Some rich gold rock has lately been taken out by the Mexican miners there. Two of Straus's steam 10-foot arastras were started on the 21st on ore from the Gavilan mine, in which a 5-foot ledge of gold-bearing rock is being worked. Another arastra will be started as soon as completed; an 18-horse-power boiler has been lately set, and other improvements made. About 20 men are employed in the mine and mills; the latter will crush six tons per day.

MINETTA.—This is the name of one of the latest discoveries in Russ district, in the vicinity of the White Hill. Messrs. Crough, Eldred and Hedge are the owners, the first named being the discoverer. The ledge, which is 12 to 18 inches wide on the surface, can be traced for nearly a mile, and at any point ore can be found. In this prospect, as in the Red Hill, what is called "black metal" is found in spots, which will assay upward of $500 per ton, but the average value of the ore is thought to be something over $100 silver, with a high percentage of lead.

RUSS.—The new developments in this district, which promise to be of such importance, are situated not over 12 miles south-east of Independence, near the summit trail to Beveridge. They are within a short distance of the Union Spring. The district itself covers the western slope of the Inyos between Lone Pine and Independence, and faces the railroad. The mines of the White Hill group possess natural advantages equal to any in the county, and we can see no reason whatever for doubting that Inyo will, ere long, export bullion steadily.

Nevada.

FRENCH CORRAL MINES.—*Foothill Tidings*, Mar. 29: French Corral in this county has had for many years a world-wide reputation as a hydraulic mining district. The Milton and other companies there made the great reputation. But French Corral has likewise some good quartz, as mill workings have shown. About 12 years ago there was a quartz mine and mill (10 stamps) at that place and the mining and milling of ore returned profits to the owners. A slide, however, occurred which damaged the mill and tunnel to such an extent that work was stopped. Then the owners disagreed, which made the stoppage continue until the present. Now, however, Charles Bradford and Alex. Dahlberg have purchased a controlling interest in this mine, called the Slide, and they are going to work the ledge. The tunnel is being cleaned out and repaired and the mill is to be fixed up and put in first-class order. The quartz will be taken out through a tunnel, and the tunnel gives at least 1,000 feet of backs. The quartz looks well, showing free gold to the naked eye. The ledge is from 6 inches to 30 inches thick, and the country rock is slate. Several working miners have purchased the old hydraulic claims heretofore belonging to Mr. Villain, and the purchasers will proceed to work the claims at once by drifting. These claims would not pay any more by hydraulicking even if there were no legal difficulties in the way. The new owners by careful and systematic work and by being their own workers think they can do well by drifting.

DERBEC.—North San Jaun *Times*, May 2: There are over 80 men on the pay-roll of the company, of which number from 20 to 25 labor on the lower level of the mine; the others work in the tunnel, at getting out timbers, in the mechanical department and at the dump. The shaft is about 400 feet in depth, and the level on which the company is drifting is about 360 feet below the surface. The gravel now hoisted through the shaft is obtained about 4,000 feet distant from the shaft, and almost due north from that standpoint. The mine is drained by a tunnel over 3,000 feet in length, the water emptying into a creek near the town of North Bloomfield. It is from this tunnel that most of the gold is taken at the present time. Wm. M. Davis is the undergound foreman of the mine. We heard fears expressed by several of the employes that the mine would be closed down in the near future, not for repairs, nor because it does not pay, but for, they say, the purpose of reducing wages from $3 to $2.50 per day. The workmen say that an effort has been made to accomplish such a reduction, but without success. They strenuously oppose any reduction of their wages. Relief Hill is a quiet camp, there are two drift mines at work in the neighborhood.

Plumas.

STRUCK GRAVEL.—Plumas *National*, May 2: Messrs. Meikle, McDonald and McDougall struck gravel in the bottom of their shaft last Monday night. Mr. Meikle informs us that it is about 4 feet thick, and looks like the genuine pay grit. This claim joins the Garland claim, and is undoubtedly just as good.

THE ALTOMA.—Greenville *Bulletin*, May 2: This mine is situated near the Cherokee, and was worked two years ago. Judge Emmons is now sole owner. The chimney worked out above paid $10 per ton. A second tunnel, which was begun for the purpose of tapping the chimney at greater depth, is now in 230 feet, and it will be pushed ahead until the chimney is reached.

GOLD STRIPE.—Work has been commenced in the Bidwell tunnel, the length of which is 900 feet. After making an upraise of 70 feet for an air shaft, the tunnel will be driven ahead 275 feet to tap the pay chimney which was in the tunnel above. The backs will then be 50 feet. This mine has been very rich, and there is but little doubt that if the stockholders would put up the proper amount of money for development, the mine could be made to yield as richly in the future as it has in the past.

Shasta.

BUCKEYE.—Shasta Co. *Democrat*, May 2: We visited several mines in the Buckeye district last Saturday. We found Dan O'Neal of the Florida hard at work re-setting his cannon-ball mill. He has several tons of rich ore on the dump which, upon being burnt, shows much free gold to the naked eye. From there we visited the Mammoth and Central, owned by Messrs. Willet, Young, Meyers & Co. Here we met a couple of mining men who were taking samples of ore from the two mines for testing with a view of purchasing the property. The Mammoth is simply immense; the vein is 22 feet wide, the pay streak is over 16 feet in width, and 69 tons of ore crushed in an arastra yielded from $23 to $45 a ton. The Central is not as large a lead, but we think it equally as good property. Both mines are splendidly situated for deep development. Returning home we passed by the Florida to the first extension south, where we found four hardy and jolly prospectors had struck a rich thing only a few days ago. They were down ten feet on a strong 5-foot vein, and were taking out rock that goes $300 to the ton. The rock is of a honey-comb nature and appears to be free milling. These four prospectors had come from Trinity county where they had spent about two months unsuccessfully, and to say that they are now happy would hardly express it. They think that they have struck it at last. However, to say the least, it is a very rich and flattering prospect. Passing by Tom Harrison's place we found him sluicing over some tailings that are paying him from three to five dollars a day. Tom, also, we think, owns some good quartz property, and is preparing to start up his arastra.

BONDED.—*Courier* May 2: Fife & Dale, the parties to whom the Silver King claim near Centerville was bonded for $10,000, have surrendered the mine after having sunk some 70 feet on the ledge. We understand that Brincard & Lowrey, owners, continue the work. A French gulch man says there is more exhilarating beverage drank in that hamlet and more gold taken out of the mines of that district than in any other locality of equal population in this or any adjoining county. The group of mines now owned by Wm. T. Coleman in French Gulch district are known to be rich and contain ore enough to yield millions. It was a lucky day for Mr. Coleman when he invested in those mines, and it was also a lucky day for French Gulch district when he directed a portion of his capital in that direction.

SULPHURETS.—Shasta Co. *Democrat*, May 2: Mr. James Sallee was at Flat last week examining the sulphuret concentrates of the Murray mine. His assays gave an average of $163 per ton in gold. The McDonald Bros. & Franck, of Deadwood, have two Frue concentrators attached to their 5-stamp mill. The percentage of the sulphurets in their rock is so great that it keeps both concentrators running to save them all. These sulphurets are of a very high grade. Work on the Last Chance mine near Flat creek, recently bonded by Capt. Wm. York, of Vallejo, is progressing rapidly under the direction of Mr. George Smith. A good road has been built between the tunnel and the mill, and the mill is being overhauled in preparation for a run. Four men are employed. Messrs. Derby and Skidmore, of San Francisco, were on Squaw creek last week examing some locations in that district. Their attention was called to the locality by Mr. W. W. Nichols, of Camp Bailey, and were his guests during their stay. On their return they took samples of ore to the city for the purpose of making working tests. M. P. Schearer has struck the richest gold quartz prospect we have seen or heard of in this part of the State. It is located on the south bank of Salt creek about 500 yards from the railroad, and about 2 miles from Redding. This strike was first made about six weeks ago by Messrs. Schearer and Rattler, while clearing away some tailings deposited in the gulch by Chinese miners, and at that time the rich quartz caused no little excitement in Redding. They have sunk a 20-foot shaft on the vein, and the quartz is richer than ever, even much of the slate lining is richly impregnated with fine gold. The vein seems to be quite well defined, is strong wo feet wide, and pitches into the mountain. In all this prospect is simply immense.

Sierra.

A GOOD RUN.—Sierra *Tribune*, May 7: Last week Hill & Son made a partial clean-up after a six weeks' run with their arastra at the Oro quartz mine, realized between $1,300 and $1,500. The exact value of the gold has not yet been ascertained. At all events, the result of the run was very satisfactory to the parties and they feel very much encouraged over it. The cost of labor and running expenses during that time was in the neighborhood of $600, thus leaving a very handsome profit.

FOREST CITY MINES.—The Bald Mountain Company, at Forest City, cleaned up 276 ounces of gold Sunday as the result of the week's work. The Bald Mountain Extension Company, at the same place, cleaned up 130 ounces of gold that day, from gravel taken out of the South Fork ground during the week. The Extension Company expect to reach the channel in their own ground the early part of July. The Bald Mountain Company, we understand, will sink a shaft soon to determine the extent of the newly discovered channel under the lava. If the result of their explorations warant it they will then run a tunnel to tap the lead, which at present is being worked through an incline.

THE ORO QUARTZ MINE.—Mountain *Messenger*, May 2: The Oro arastra belonging to Mr. Hill, was cleaned up last Saturday, after a run of 54 days, the yield being $1,365, estimating the bullion to be worth $17.30 per ounce, which is probably from 25 to 30 cents less than its true value, which will be determined when returns are received from below. The bottom of the arastra was not taken up, and contains several hundred dollars. There have also been saved some four tons of sulphurets, or blanket tailings, which are worth at least $25 per ton, and probably considerable more. The amount of quartz crushed is estimated at 256 tons. At a safe estimate the whole amount crushed averaged $6.50 per ton. The expenses of mining and reducing the rock for the run are $600. The net profit, then, does not vary much from $20 per day. While this is not big, it will put in circulation about $11,000 a year, which will materially help business to this place. Mr. Hill has another arastra, somewhat smaller than the one he has been using, about ready to run. This will be used to grind the tailings from the larger machine, and will be run on quartz when not otherwise employed. There are several ledges here as good if no better than the Oro, and when they are worked they will be a great help to everybody.

Trinity.

DEADWOOD.—Cor. Trinity *Journal*, May 2: Would it be news to the readers of the *Journal* to speak of the prosperity of the Brown Bear, the Bartled and various other noted mines? I should think not; for the bullion shipped from these mines confirms the fact. I cannot chronicle, this time, any very important discoveries, but hope to do so very soon, as prospectors are now beginning to put in an appearance. It is impossible to make strikes of any consequence without some immigration of prospectors. Walter Van Matre and Alex. Campbell have opened on a ledge about 15 inches in width which looks very promising Blakemore & Co., on Eastman gulch, have struck it good again. The strike is about 2 feet between walls and prospects immense. The Boston mine, owned by Wm. Lappan, at present bonded by W. T. St. Auburn, will soon be in operation. We live in anticipation of seeing another rich mine opened. Shattuck & Co. are expected soon to commence operations on the Klein mines, The Vermont mine will also soon be in operation. This coming summer will find our district booming with population and prosperity.

Tuolumne

LOOKING LIVELY.—Tuolumne *Independent*: May 2: Fred Sutton's San Guisseppi mine a short distance west of town is looking finely. The lode runs from 8 inches to a foot wide, and the chute is about a hundred feet long. The shaft is down 70 feet. The ore is very rich, $200 rock it is supposed, and heavily charged with sulphurets. We saw some of the rock which had been burned, and the gold was thickly distributed all over and through it. A practical quartz miner, and good judge of sulphurets present, estimated that there, alone, would yield $1,500 per ton. The mine needs no puffing; it speaks for itself, and we don't think Fred wants to dispose of it. It is one of the kind that will pay to keep and work. A party above Columbia came upon the heels of what will undoubtedly prove a fine pocket last week. Several large chunks of gold and quartz were exhibited to us. Mr. Wm. Lewis, who owns a claim on the old Sugarman mine, on Bald mountain, struck another pocket on Monday of $200. He finds them frequently, but as yet they have not been as large as the one he is looking for. Messrs. Long & Hampton were in town Wednesday. They have ten or twelve men working their Willetta mine, on Kanaka creek. The lode is some 200 feet wide, of $3 rock, with a dozen or more rich veins running through it. They are on one of these now, and expect it to "bunch up" very soon, when gold may be taken out by the pound. Mr. Long has several beautiful pieces of gold quartz, very rich, taken out a few days ago. On Saturday the Mandich brothers, on the Simonich claim, were reported to have taken out another pocket of $6,000. The figures were exaggerated—the real amount being very near $2,000. The Argentum mine looks very well. A force of men are at work on the Italian Bar mine. The Chinamen engaged in working out the lumber yard lot have a good claim.

BRIEF NOTES.—Union *Democrat*, May 2: Tom Birney and R. Ham are grinding out gold in paying quantities with an arastra four miles above Columbia. The old Baldy Clark mine at Whisky Hill is turning out handsomely under the operations of a couple of miners who are making a good thing out of it. Sinking will shortly be resumed in the Lafayphier with a power drill. Arrangements are now being made for a drill and air compressor in San Francisco. The Mandich brothers, who are working the Simonich claim under a lease, struck a fine pocket last Saturday, and report credits them with taking out several thousand dollars. John H. Neal has a force of men energetically prospecting the old Sugarman lead, which has been a famous ledge for pockets in years gone by. The prospects are excellent for a strike. Harkness & Peterson, who are working a portion of the Garrett claim, took out fifty ounces last week. They have been taking out handsome bunches at intervals all winter, but have made no blow about it. Messrs. Divoll, Bacon and White are preparing to actively prospect the Bonanza mine. The tunnel has been completed and the incline cleaned out and timbered up, and the work of sinking has been commenced. Julius Halck and his partner have lately taken out a pot of money on Saratoga Hill. They struck it big some time ago, and have been getting fat takes ever since. They are rapidly becoming bloated capitalists. Captain Colby has rigged up a water wheel to pump the water out of his mine, the Bonanza Extension, He has taken some good pockets out of it heretofore, and present prospects lead him to think he is on track of another big find. Some exceedingly rich free gold quartz is being taken from the San Guisseppi mine in Dragoon gulch. The mine is the property of J. Hall, who has lately put up pumping machinery, and has a force of men developing the property. S. H. Teeters informs us that he will put up an arastra at Sugarpine right away to crush rock from the Hoyle & Dagnar mine. He will also proceed to open up the property as fast as circumstances will permit. The property shows up finely, and gives good prospects of being quite a bonanza. There are three ledges.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, May 2: On the 2,900 level, cross-cut No. 4, after entering t

ore vein at a distance of 60 feet west from the main north lateral drift, was turned laterally with the vein and is now following it in a course or direction 45 degrees west of north. From where it was turned to this direction to the face of the drift or cross-cut the distance is 53 feet, the entire distance from the main north lateral drift thus being 115 feet. The face of this drift or cross-cut is a little less than 200 feet from the Savage north line, and is all in ore which, from average assays obtained, will probably mill $25 or $30 per ton. The width of vein at this point is unknown, and can only be determined by crosscutting, which will be done at the first eligible point, but from the lay and general characteristics of the vein in passing diagonally through it, as well as from its ascertained increase in width in cross-cuts 2 and 3, further south, its width should be comparatively great—from 60 to 100 feet, more or less. The ore in the face of the drift is very loose, requiring close and careful timbering, and making progress comparatively slow. On the 3,000 level, the lateral drift south from cross-cut No. 2 was run 15 feet, following the ore vein, and stopped in ore of comparatively high-grade. This being considered satisfactory for the present, work in that direction was discontinued, and a lateral drift north started on the opposite side of the cross-cut, which is still being continued due north, following the ore vein. It is now in, or out, 35 feet from the cross-cut, and the vein, which was 15 feet wide in the cross-cut, is evidently widening as the drift advances northward. The average assays, however, decrease somewhat in value. Cross-cut No. 3, which has been run to the wall or selvage of the vein, will soon be pushed further west to a connection with the lateral drift in the vein, giving better air circulation, and testing the width of the vein at that point.

BALTIMORE CON.—The parties working on the 225 level have their winze well started, following the rich ore streak. They got some very high assays. Last Sunday they started up the old hoisting works and hoisted out a large lot of waste which was in the way. The tributers working on the 450 level have a large amount of high-grade stored in the drifts, and plenty more in sight. They will hoist this ore out in about ten days from now. Meanwhile a roasting furnace is being built at the works. When this is completed, and not before, the ore will be raised to the surface. Over 100 tons of rich ore is stored in the drifts below, ready for hoisting and milling.

CON. CALIFORNIA AND VIRGINIA.—On the 1,750 level the main southwest drift has cut into the stopes of the old workings of the Con. Virginia ground and connected with east cross-cut No. 2. The immediate object at present is to push through to a connection with the Gould and Curry 1,700 level which will give a good circulation of air. Meanwhile what good ore is met with is being extracted. An increased quantity of ore from between the 1,550 and 1,200 levels, under the Jones lease, is being extracted and shipped to mills on the Carson river.

ALTA.—The bunches of good ore found in prospecting above the 950 level are rather too few and far between for lucrative working, and operations at that point are about abandoned. The water in the shaft has risen to above the 1,200 level, and is still rising.

OVERMAN.—The winze connection between the old Lambert tunnel and the 226 level being completed, the investigation of the low-grade are resources at that point is now in progress.

OPHIR.—The main south drift on the 1,465 level is still being used as an outlet for waste from the Con. California and Virginia, which is hoisted through the Ophir shaft.

MEXICAN.—The joint Union and Mexican drift is now 200 feet in the Mexican ground, and being driven northward at a lively rate in good working ground.

KENTUCK.—The usual amount of low-grade ore continues to be yielded from the old upper workings, supplying the Rock Point mill on the Carson river.

BEST AND BELCHER.—On the 1,000 level a drift to the north-east has been started from the main north drift at a point 100 feet south from the face.

YELLOW JACKET.—Nothing new. The old stopes of the upper levels continue looking and yielding finely, with no particular change to note.

BELCHER.—The yield of low-grade ore from the old upper levels, through the Crown Point, continues with no new features to note.

CHOLLAR.—Cross-cut No. 1 from the main south drift on the 3,000 level continues in good looking quartz and vein matter.

BULLION.—The parties prospecting the croppings are still engaged in cleaning out and repairing the old Fairview shaft.

GOULD AND CURRY.—On the 1,000 level the main south lateral drift is making good progress, running in good working ground.

SIERRA NEVADA.—The north lateral drift on the 520 level is being pushed ahead at the rate of about 50 feet a week.

CROWN POINT.—The old upper workings employ a large number of men in the extraction of low-grade ore.

Columbus District.

MOUNT DIABLO. — *True-Fissure*, May 2: The west drift from the sixth level has advanced 16 feet during the week, and shows more favorable ground with small spots of low-grade ore. The winze from the fifth level is now down 63 feet, and is showing ledge matter with a little ore. The stope above this winze is looking well, and the stope between the fourth and fifth levels shows a strong ledge of $90 ore. Some ore of good grade is being taken from between the fourth and fifth levels near winze No. 1. The intermediate, between the third and fourth level, and near winze No. 4, is giving some $100 ore from a small bunch. The west drift on the third level is giving some $150 ore from a small bunch. The intermediate, between the second and third levels and west of the shaft, is yielding a little $40 ore. The east drift on the second level is giving some ore of fair grade. The workings above the second level show no change. A bullion shipment of $12,937.08 was made on the 30th ult.

Eureka District.

NEW WORKS.—Eureka *Sentinel*, May 2: The Eureka Con.'s new reductions works are fast approaching completion. So much auxiliary work in connection with the new plant has been found necessary that the completion of the same has consequently been deterred much longer than was expected. It is confidently believed, though, that the new furnace will be fired up two weeks from Monday next. The Eureka Con. mine continues to look and produce well. The Phœnix mine on Ruby Hill shipped during the past week eight and a half tons of ore to the Eureka Con. reductions works. The Summit mine on Prospect mountain sent down to the Eureka Con. furnace the other day five and three-quarters tons of ore. The Grant mine on McCoy Hill sent to the Eureka Con. furnace eight and three-fourths tons of ore last Monday. The Dunderberg mine on Prospect mountain shipped to the Richmond reduction works the past week 11 tons of ore. Owing to a number of improvements going on in the Lord Byron mine, only 30 tons of ore was shipped to the Richmond reduction words the past week. The mine continues to look well.

ADAMS HILL.—A reporter of the *Sentinel* visited Adams Hill yesterday, and took a cursory and hasty glance at the mining situation there. Quite a little army of miners are at work in the numerous mines, and every one at work appears to know but little of the dull times one hears so much of in town. To a casual observer (the reporter did not go into any of the mines) it appears strange that a district so prolific of good surface indications and rich ore should have been overlooked as it was during the palmy days of Eureka district. Ore which furnaces from $20 to $300 is being extracted from five or six of the mines there, and yet there is not a single property in the section proper that has on it other hoisting facilities than the cheap windlass. From the hasty glance our reporter took of the section and the limited information he got of what is being done in the several properties that are being worked he feels safe in predicting that Adams Hill will be some day, and it may not be a great while, the best and richest section of Eureka district.

Jackrabbit District.

RICH ORE.—Pioche *Record*, April 29: A large body of rich ore was recently encountered in the Sailor's Delight mine, of Jackrabbit district. The ore has been drifted into for about 30 feet, and assays about $30, and running through the ore body is a 2-foot vein that assays from $100 to $200. The extent of the ore is not known. The Kingfisher is developing a large body of ore, and at the present time there is no telling what a day may bring forth. The ground is broken up and is such as ore bodies live in. Feeders from a half-inch to three inches in thickness are running all through the ground. The Terror and other claims of the district are looking well, and the mine owned by Takat & Fitzpatrick has a ledge six feet in width, the second-class ore going $50 in silver. One of these days Jackrabbit district will make a record as a bullion producer that it will feel proud of.

Tuscarora District.

INDEPENDENCE.—*Times-Review*, May 1: Each cross-cut 400-foot level extended a total distance of 72 feet. Upraise from the 400-foot level to connect with No. 1 shaft has been carried up 30 feet. Fair progress has been made with the repairs on No. 1 shaft.

BELLE ISLE.—Drift north from west cross-cut 250-foot level has been extended the past week 7 feet. A drift has been started south from the same point. Drift north from the east cross-cut 400-foot level advanced 10 feet. A cross-cut has been started west on the 350-foot level.

NAVAJO.—During the past week drifts on the 650-foot level have been extended 68 feet. On the 350-foot level cross-cut and drift advanced 54 feet. Work has been suspended in the south drift, east lateral vein, 250-foot level, and work will be resumed in the south drift on the east vein 150-foot level. Cross-cut west 150-foot level extended 8 feet. Fair progress has been made in all the other workings.

ARIZONA.

MILLS ETC.—Prescott *Courier* May 1: The mill of the St. Louis Yavapai Mining Company is pounding away in Humbug district, and there are a great many well pleased miners in that portion of Yavapai county. Mr. Chase is running one of his ten-stamp mills in Turkey Creek district. He is concentrating the sulphurets. The Del Pasco mill is running successfully on the ore from the Del Pasco. The Peck ten-stamp mill and pans are running on Peck tailings. The Senator mill will be taken down next week and moved to Turkey Creek district. The Conger ten-stamp mill will be started on a long run next week. Its owners have plenty of gold rock to be pulverized by it. A great many miners want them to do custom work for them. They will do so as soon as their own rock shall have been attended to. The mill is operated by water-power, so that the cost of running it will be light. The work of opening a level in the Sterling mine is progressing. Miners have great faith in the mine and are predicting that it will soon be the most valuable gold mine in this or any other Territory. The Chase mine, which is near the Sterling, is again attracting attention. It is a gold mine; rock easily worked. Mr. J. H. Brown, who has just returned from the Conger mill and Verde valley, tells us that the mill will start crushing Conger rock in a short time. Bush Bros., who are managing mill and mines, are good business men and will, Mr. Brown believes, achieve success. Twenty tons of ore from the Bullwhacker have just been worked at the mill on Lynx creek, and Mr. Brown, who was there when a clean-up was made, is satisfied that the rock paid $50 a ton in free gold. The owner of the Ethel mine, Hassayampa district, George A. Allen, who recently bought an interest, and R. W. C. Merrington contemplate making a shipment of high-grade ore to Pueblo for reduction at an early date, the recent developments having made the owners feel pretty good.

ASH CREEK.—Arizona *Miner*, May 2: Jim Vandeburg is in town from his mines on Ash creek for supplies. He informs us that there are from fifteen to twenty men working constantly in that district, and that good returns are being obtained by arastrating the ore extracted,

PLACER.—Secretary Van Arman has returned from a trip to lower Walnut Grove, where he went to inspect some rich placer ground in that locality. He reports about 200 acres of placer ground in a body, that with water could be made to pay very largely; but thinks it an enterprise which will cost considerable money to work successfully.

GOOD FOR WOOD RIVER.—Wood River *Times*, April 29: The Union Pacific and Oregon Short Line Companies have refused to give rates on ores from Blackfoot this year. This will compel all ores east of Wood River and west of Blackfoot to seek a market at Hailey and Ketchum, or a shipping point on the Wood River branch line. If the Muldoon, Little Wood River, Lava Creek, Lost River and Yankee Fork country fulfill the promises held out by the reports received from those regions from time to time, the refusal of the railroad companies to make rates will prove very advantageous to Wood River, as it will secure to us the ore yield and trade of a vast and rapidly developing region of country.

LAVA CREEK.—Prof. Delius has returned from the Lava Creek mines. He reports several claims showing rich ore, and the country roundabout the Martin mines located for miles. Money is very scarce in the new district, however, and for this reason the Proffessor does not look for it to be developed to any great extent yet awhile.

MOHAVE.—*Miner*, May 2: D. W. Grant is taking out a nice lot of ore from the Schenectady mine at Chloride. James Cadden is hard at work on the Diana mine at Chloride and is taking out some very fine ore. We hear that some parties are about to take hold of the Empire mine on a lease. Years ago this was considered one of the best mines at Chloride and we know of no reason why it should not be so yet.

COLORADO.

CLEAR CREEK NOTES.—Colorado *Miner*, May 2: Hood & Co., lessees on the Griffith lode, Griffith mt., shipped one carload of ore to Denver on Wednesday last. Syster Bros., formerly lessees on the White lode, on Red Elephant, have taken a lease on the Eclipse lode, on Chicago creek. Swanson & Co., lessees on the Seven-Thirty lode, on Brown mountain, brought down a load of ore on Tuesday last, which returned 243 and 83 ounces silver to the ton, according to class. The Orient lode on Red Elephant, is looking very promising. Carrothers and Keazy are drifting on the 40-foot level west. The breast shows a vein of mineralized quartz eight inches thick. Holbrook & Co., lessees on the Plebeian lode, on Columbia mountain, have opened up a two-inch vein of solid ore, showing considerable silver glance. McNulty & Co., lessees on the Fred Rogers' lode, have increased their force to 15 men. They have also let a contract for driving the main level ahead a further distance of 300 feet to intersect with the engine shaft on the Fred Rogers' vein. The Last Chance lode, on Douglass mountain, is a new discovery by Chris Tarpin, who has driven an adit on the vein about 30 feet, the breast of which shows a vein of solid ore two inches thick, which assays 28 ounces silver and 75 per cent lead to the ton. The Highland Laddie lode, on Red Elephant mountain, is being developed by an adit on the vein, and has been leased and bonded to Messrs. Twining and Murdoch, who have exposed about 12 inches of ore, carrying blue and green carbonates of copper and gray copper.

IDAHO.

SMALL VEINS,—Idaho *World*, May 1: Several locations have been made this spring on small veins, discovered in California gulch, near Placerville. The veins are a mile or two north-east of Gold Hill mine, and as the Gold Hill runs north-easterly, it is believed that these veins are feeders or spurs of the main ledge. The extension of the Gold Hill vein may yet be struck in California gulch or that vicinity. James McCurdy and his partner were in town Wednesday. They brought over their dust and sold it to the bank. They have been working placer ground near Henry creek, two or three miles this side of Centerville. In working the placers they uncovered a quartz vein for 75 feet. The vein varies in thickness from four inches to fourteen inches and prospects well in places. Jim will go to work in a day or two on the Storm King, a ledge discovered last fall by himself and George Carey, and in which John Lamberton owns a third interest. This location is in Lewis's gulch. James Smith, a veteran prospector, arrived here Wednesday from North Idaho, coming via Salmon Meadows and Mineral district. He owns locations in Mineral. The ore in that district carries copper and some gold and silver, but not in paying quantities.

MINING SEASON.—The *Democrat* has been misinformed in regard to the mining season of Boise basin. It says "some of the big mining companies have already suspended work after a few days' run." All are at work on this side of the basin except one or two small companies working on Last Chance Bar, and they have water for only a few weeks every season. This will not be a first-class water season, and may not be quite up to the average, but mining still goes on, and some of the claims have been running a month, and some longer.

THE GOLD BELT.—Wood River *Times*, April 29: W. H. Atkinson came in to-day from the Rock and Camp creek region, where he spent five days looking over the country, testing the veins. At Rock creek there are at least two well-defined parallel veins, between granite and porphyry, that can be followed by the outcroppings for miles. In these veins the ore occurs in chimneys, as in other veins, and Mr. Atkinson broke out a number of samples which he tested by the oldest yet most reliable test of gold prospectors, to wit, with a pan and horn. In this way he made various tests of Camas No. 1 and Camas No. 2 ore, and got dozens of colors to a horn, indicating that the gold was comparatively free and that there was considerable of it. In Camas No. 2, for which Judge Doniphan is bringing in a mill, there is a vein 14 feet wide in the shaft—of ore said to average $40 a ton. If it goes $20, Mr. Atkinson says, the "prospect" is of such a mine as will astonish the world. Besides the rich ore, there are vast quantities of low-grade ore that will take years to open up, let alone extracting and reducing. The croppings of the Camas No. 1, Mr. Atkinson says, are as much like the old Gould and Curry croppings as any he ever saw on or off the Comstock, and he has no doubt that where there is so much "blossom," as Dan de Quille calls it, there must be considerable "fruit." The Camp and Rock creek belt, Mr. Atkinson believes, begins at Resurrection district and follows in a general north-westerly direction toward the head of Rock and Camp creeks, Deer creek and on to the Smoky and Atlanta country. There will be paying mines on this belt long after the balance of the Wood River mines are worked out, if such a day ever comes.

NEW MEXICO.

NOTES.—Silver City *Enterprise*, May 1: A big strike has been made in the Bull Dog mine, at Malone. It is owned by L. A. Snyder, John McMannigil and Allan H. MacDonald. The development of the Little Mamie in Santa Rita district is steadily progressing. A shaft is being sunk 8x10 feet. Several stringers which cropped out on the surface have concentrated, and the vein shows about 18 inches of pay ore which assays one and a half ounces in gold. The Osceola at Santa Rita is developing into a first-class property. It is claimed that 11 inches of the vein will average 45 per cent lead and 36 ounces in silver. This property is owned by Jacob Long, a thorough mining man, who has confidence in his property and is now engaged developing it. The Mimbres Company's mill at Georgetown resumed operations on Monday last, having been closed down about a month. The delay was occasioned by the non-arrival of repairs ordered from the East. Another string of silver bricks will soon be started from the mill to the Eastern markets. The Pilgrim is undoubtedly one of the big mines of Grant county. A 6-foot breast of ore has been uncovered at the bottom of a 40-foot shaft which assays from 100 to 600 ounces in silver. On another part of the mine a 4-foot breast of ore of the same character and quality is being worked. Tom Levy and Walls Brothers are the owners. An experimental run of 100 tons of ore is now being made at White Oaks upon ore taken from the Vera Cruz mine, near that place. The mine is owned by a Topeka, Kansas, Company, and it contains a very large body of ore. If this run proves profitable the company will at once commence the erection of an extensive gold mill. Lincoln is the most promising gold county in the Territory.

OREGON.

ON THE BOOM.—*Bedrock Democrat*, May 2: It is authoritatively stated that all of 300 prospectors are in and about Mineral City, and they comprise expert miners from Nevada, Colorado, Wood River and other mining districts. As these mining regions are on the decline, this new field and others in Eastern Oregon attract attention, and every confidence is expressed on their part of making lucky finds in our section. It is now almost an assured fact that extensive mining machinery will be brought into Mineral this summer for the working of the rich ore, of which there are hundreds of tons on the dump of several of the mines. Negotiations are now pending for the sale of some of the valuable properties to mining capitalists, and should this be done, the camp will be the liveliest in the northwest. It would be well for all of our citizens to keep a sharp lookout as to the value of mineral discoveries in the Mineral districts, secure the ownership of properties there and sell them to good advantage when the proper times comes, which is not far distant.

UTAH.

SANDSTONE MINING NOTES.—Southern Utah *Times* April 29: The Stormont Company is working a full quota of men in the mines and the mill is constantly running ton pans on the ore extracted. The mill may shut down temporarily for repairs before long, but the report current on the streets with regard to a reduction of wages has no foundation. It was merely an idle rumor. The Christy Company employs about eighty men, and has never before shown such signs of a brilliant future. This Company's pet properties, California and Maggie, have developed into bonanzas. The ore from these mines alone keeps the mill in constant operation. A large body of high-grade ore has been opened up on the three hundred foot level which appears to improve in quantity and quality every day. There is a large body of first-class ore exposed in the stopes of the Tecumseh and Stormy King, but there will be no ore taken from these mines before the proper air connections are made, which are about completed. If the mines of the Christy Company continue to improve, new milling facilities will be in order. Miles & Richards have struck a large body of high-grade ore in the Vanderbilt. Parties who have been out to the mine say it is one of the biggest strikes that has been made by individual mine-owners around the Reef for a long time. When Charlie Miles and Dick Richards took hold of the property the ore was supposed to be about gouged out and it had been abandoned as worthless. They took off their coats, cleaned out all the old workings, and by hard and intelligent work have succeeded in developing a valuable mine. There is a force of men at work opening up the mine and taking out the ore. The boys have met with deserved success. There are a number of idle prospects around the Reef which only need the same kind of work to convert them into paying mines. Ed. Lochney is pushing things on the Bonanza, out on the East Reef. He is at present working in the north drift at the bottom of the 150-foot shaft. The drift is run in on the ledge and shows up a body of ore between six and eight feet in width. He has hundreds of tons of ore in sight in his mine, but it is low grade, averaging between fifteen and twenty ounces. He has about fifty tons of fairly good ore on the dump.

REVIEW. — Salt Lake *Tribune*, May 1: The fine weather which has so generally prevailed this spring was continued in the past week. Ore receipts, however, were light, owing to bad roads, and bullion shipments were not heavy. The shipments of the metals out from Salt Lake City for the week ending Saturday, April 25th, inclusive, were 885,500 pounds. The receipt of bullion and ore in this city for the week ending April 29th, inclusive, were: Bullion, $63,372.65; ore, $3,850; total, $67,222.65. The week previous the receipts were $90,895.07, of which $78,095.07 was bullion, and $12,800 ore. The Ontario sent in of the above 31 bars of bullion, valued at $18,235 95, making the total shipments of that company for the present year $569,341.80, out of which regular monthly dividends of $75,000 each or (with the dividend of April 30th, to be paid in New York) $300,000 in all. The Horn Silver is still dormant. The Sandstone district of Silver Reef sent $6,930 in silver bars, of which the Stormont contributed two, assaying $3,600, and the Christy two, assaying $3,330. The product of the Hanauer smelter for the week was nine cars of bullion, $20,800. The Germania sent out two cars of bullion, $4,096.70

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

A Glance Over the Mining Field.

The mine superintendents who met at Wood River to talk over wages, freigbts, etc., did not seem after all to favor cutting down wages below $4. Colonel Wall, W. T. Watt and Professor Jenney objected to posting notices that after June 15th wages would be $3.50. A resolution was adopted that another meeting should be held June 1st to talk the matter over and ascertain what, if any, steps should be taken to reduce the cost of mine exploitation in that region.

The Eureka Consolidated and Richmond furnaces, at Eureka, Nevada, when in full blast consume 4,000 bushels of charcoal per day.

Edward Eddy, superintendent of the Grant Smelting Works, at Denver, now a part of the Omaha Works, thinks Butte, Montana, the greatest camp since the early days of Leadville.

The Parrott mine, Butte, Montana, which has been shut down for some three months, has started up again. Between 350 and 400 men are employed.

Some 300 or 400 prospectors have gone into the Mineral City mines, Oregon, lately.

Southern Oregon expects a quartz-mining boom soon.

A New Mexico paper says that in the Sierra Company mines at Laks Valley there are tens of thousands of tons of low-grade ore in sight, which cannot be shipped, while the pockets of higher grade ores, so far as they have been developed, are pretty nearly worked out. That the mining of the bodies of low-grads will develop yet other masses or veins of the richer ores is warranted by the experiences of the past. The ground is not worked over by any means. The problem to solve is the treatment of 10 to 15 ounce ore profitably.

The 20-stamp mill being put up at Quijotoa, Arizona, will not be running before the 4th of July. A correspondent states that the camp is not "booming" as represented. There are not over 60 men employed, all told; business of every kind is frightfully overdone, and only one mining company operating in all the district. Excellent prospects exist everywhere through the mountains, and the adjacent ground is all located by different parties; but they are all waiting to see the Bonanza Company begin to ship bullion before they commence operations.

Considerable excitement has been caused at Clifton by the finding of gold in the Morning Star copper mine 10 miles east of that place.

Ex-Senator Chaffee, while testifying in the Little-Pittsburgh mining case in a New York court, in answer to a question put by one of the jurors, endeavored to explain the uncertainty of mining by stating that in this mine they found what they supposed to be some very valuable blocks of ore, but on getting into them it proved to be very poor mineral and worth very little; in fact, not sufficient to pay for taking it out of the mine.

The Walker Lake *Bulletin* says: Col. Ellis has sold the State Line mine to a New York company, under the name of the State Line Consolidated.

In the northern part of Amador county the Cosumnes river supplies all necessary power used in mining and milling, while the Mokelumne river performs like service for the mines and mills in the southern portion of the county. Near the summit of the mountains in this county are several large lakes containing immense bodies of pure water, which is led to the mines and valleys below, through the Amador canal, and other small ditches.

Somebody discovers a tin mine every now and then, but so far on this Coast none of them have amounted to much. The latest discovery is in Antelope valley, Mono county, Cal., about 52 miles from Carson. A writer in the Carson *Index* states that the whole country is excited and that locations are being made in all directions. The writer believes it to be one of the greatest discoveries ever made on the Coast. There are large quantities of the ore around the hills, and future developments will be awaited with interest.

There is more prospecting being done in the vicinity of Sierra City than at any other time in the history of the camp.

Captain Drake, of the Eberbardt, is negotiating for the purchase of the Monitor Company's mining and milling property, valued at $300,000.

Everybody in the Hay Fork section of Trinity county is excited over quartz, and several good prospects are reported.

The Grand Prize mines, Tuscarora, will be started up before long.

During the year 1884 some 207 assessments have been levied on 117 mines in California, Nevada, Utah, Alaska and Arizona. Of the assessments levied it is estimated that over four million dollars have been paid. Of this amount shareholders of Nevada mines paid $3,632,950.

A number of new locations have been made recently in White Hill district, Inyo county.

Bullion Shipments.

Mt. Diablo, April 30, $12,937; King, May 3, $8,348; Barbers Mill, 3, $4,095; Christy, April 28, $1,780; Vienna, 28, $3,980; Hanauer, 28, $4,500; Stormont, 28, $3,600; Nevada ore, 28, $1,000; Queen of the Hills, 28, $1,600; Hanauer, 29, $5,600; Ontario, May 1, $31,665; Hanauer, 1, $2,200; Queen of the Hills, 1, $5,200; Hanauer, 2, $4,300; Minnie Moore, 2, $1,000; Christy, 2, $1,790; Vienna, 2, $1,980; Germania, 1, $4,150; 2, $2,282; Hanauer, 3, $2,200; Germania, 3, $2,272. Bullion shipments from Silver Reef, Utah, for the month of April aggregate $33,391.77.

The base bullion and ore output from Salt Lake for the week ending May 3 amounted to twenty-nine cars of bullion and eighteen of ore. The bullion weighed 714,298 pounds, and the ore 502,320 pounds. There was no lead shipped last week.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—San Louis Obispo and Santa Barbara Co.
GEO. MCDOWELL—Santa Clara and Santa Cruz Co's.
G. W. INGALLS—Arizona.
M. S. PRIME—Alameda County.
MRS. OZIER—California.
E. L. RICHARDS, San Diego, County.
F. W. SMITH, New Mexico and Arizona.
W. B. TURNER, California.
R. E. BUSH—Shasta, Tehama and Trinity Cos.
M. C. BAKER—Napa and Yolo Cos.

THE Smith Patent Belt Fasteners, advertised in another column by N. D. Edwards & Co., are adapted for uss on any class of belting, and are much more convenient than lacing devices. The construction is covered by several patents. The engraving shows the form of the device, and the fasteners may be procured in this city, as the advertisement indicates.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 262 Market St., S. F.]

FOR WEEK ENDING APRIL 28, 1885.

316,517.—WINDOW-SCREEN—William Bateman S. F.

316,733.—FLOOD GATE—J. S. Brown, Eureka, Cal.

316,443.—HARNESS—C. W. Burgtorf, Petaluma, Cal.

316,740.—CANOLESTICK—E. Carpenter, Lafayette, Or.

316,528.—PICK—Davis & Robbins, Banner, I. T.

316,450.—BLOCK PAVEMENT FOR STREETS, ETC.—H. G. Fiske, S. F.

316,902.—ROAD CART—E. E. Krenzel, Buena Vista, Or.

316,555.—WINDOW BEAD-FASTENER—Masters & Kimball, Sacramento.

316,559.—BUDDING KNIFE—K. McLennan, Berkeley, Cal.

316,803.—VEST AND OVERSHIRT—A. W. Mensor, Jacksonville, Or.

316,905.—MAP-RACK—F. P. Montgomery, San Jose, Cal.

316,651.—VEHICLE POLE—J. Pittinger, Carpenteria, Cal.

316,570.—SAW-GUMMER—J. Richardson, S. F.

316,488.—TAILOR'S SHEARS—S. C. Rugland, S. F.

316,669.—SMELTING-FURNACE—Smith & Bell, Sacramento.

316,670.—CABLE-GRIP—R. Solano, S. F.

316,918.—CENTERING GAGE—D. W. Standeford, Oakland.

316,586.—PHOTO FILE—W. Verbeck, Oakland.

316,592.—PROPELLER—J. Wooll, S. F.

12,189.—TRADE-MARK—Jay Eye See Liniment Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

New Patents.

DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors for the week ending March 24, 1885:

PHOTOGRAPHIC OR CARD FILE.—Wm. Verbeck, Oakland. No. 316,586. Dated April 28, 1885. This holder or file for photographs, cards, etc., consists of a series of clasps arranged so that one or two will hold the card, the sets being held together by cords or links.

WINDOW SCREEN.—Wm. Bateman, S. F. No. 316,517. Dated April 28, 1885. This invention relates to that class of window-screens in which the screen material is attached to either sash by one end and adapted to be wound and unwound from a roller mounted above or below in the window casing, whereby, when the sash is opened the screen unwinds and covers the open space, and when closed it winds up out of the way. The invention consists in a cord of any metallic nature attached at one end to a pulley on the winding drum or roller of the screen, and thence passing to and around a suitably located guide-pulley and to the window sash to which it is secured, whereby the movement of the sash operates the winding drum or roller.

BUDDING KNIFE—Kenneth McLennan, Berkeley. No. 316,559. Dated April 28, 1885. This new budding knife consists essentially in a concavo-convex or gouge shaped blade having its forward end reduced to a cutting edge, said blade being adapted to cut the stock crosswise and raise the bark, and in a flat blade set edgewise longitudinally on the convex surface of the concavo-convex blade, and having its forward end reduced to a cutting edge adapted to make the longitudinal cut in the stock. It further consists in details connected with each blade whereby they are fitted together to a suitable handle. The object of the invention is to provide a budding knife that will make all the necessary cuts in the stock and to raise its bark by a single continuous operation.

Aaron's Assaying.

Those persons who have purchased from Dewey & Co., publishers, the recent work on "Assaying, Parts II and III," by C. H. Aaron, should take note of the following errata and make the corrections indicated:

Page 91.—Lines 8 and 9, for "A mixture of carbonate and sulphate," read, "A mixture of carbonate or sulphate with galena."

Page 92.—Second paragraph: Unless the lead carbonate is dissolved on the filter (see foot-note) the solution must be filtered to remove insoluble matter before adding dilute sulphuric acid.

Page 124.—The boiling with sodium sulpbits is to be done *before* passing hydrogen sulphide. All the sulphite used should be decomposed by a sufficient addition of hydrochloric acid, a little at intervals until the last addition causes no further evolution of sulphurous acid (smell of burning sulphur).

Page 158, Etc.—The percentage of copper in the oxide should have been given, as on pages 102, 79.85. For the assay it will suffice, in general, to take 80 parts of ore,

Quartz Mill Screens.

Among the industries of San Francisco which have grown to quite respectable proportions, from our position with relation to the mining field of the Coast, is that of the manufacture of screens for quartz mills. Formerly these screens were all made of wire cloth, most of which was imported, until the factories were established here. But for the past 15 or 18 years the punched or slotted screens have been preferred by most millmen, and there is quite an extensive manufacture of them in this city. In fact the demand has been such that the largest maker here has lately enlarged his establishment. The San Francisco Pioneer Screen Works, John W. Quick, proprietor, have removed to a new and commodious building at 221 and 223 First street, corner of Tehama, where new and improved machinery, punches, dies, etc., have been added.

The slot-cut and slot-punched screens have their perforations cut with absolute cleanness, and there is an entire absence of any roughness or raggedness on the under side which would cause clogging. Mr. Quick personally attends to the manufacture of these screens, and has himself invented methods of making them. With an experience of 25 years on the Coast in this business, he thoroughly understands the wants of the millmen and miners and is enabled to comply with them.

The sale of these "Quick Screens," as they are called, is not confined to the California mines by any means. They are sent to Nevada, Arizona, Utah, Idaho, Montana, New Mexico and Colorado. They are shipped also to Mexico, Australia and Alaska. The screens made here seem to be preferred by those millmen who have ever used them. These screens are stroug and durable and will stand the wear incident to quartz-mill work. They are not liable to bulge and break and discharge freely. They are made from No. 1 to No. 15 fine, and are sold at less than Chicago prices.

In addition to this branch of metal-punching, which is a specialty of these works, sheet metals of all kinds are perforated for flour and rice mills, grain and malt dryers, furnaces, chess, cement and smut mills, separators, revolving and shot screens and all kinds of milling machinery. The very best Russia sheet-iron is used for this screen work, and Mr. Quick has been awarded medals at all the State or Mechanics' Institute Fairs wherever he has exhibited his manufactures. The new establishment is much more commodious and complete than the old quarters occupied so long by the Pioneer Screen Works, and will give Mr. Quick better facilities than he before possessed.

Mining Share Market.

There is little change to record in the mining share market or in the situation on the Comstock. In the ore-producing mines the regular yield continues, and in all the working and developing mines the usual progress is made in the matter of explorations, etc. The development of the ore vein or body in the lower levels of Hale and Norcross goes steadily forward, and the eyes and ears of a very anxious public are strained to see and hear something more encouraging from that quarter, and the very latest regarding it, good, bad or indifferent, is eagerly sought. Thus far a promising vein has been developed, carrying a good quality of ore, which may be described as something better than low-grade. And at both levels the vein has widened out boldly in going to the northward toward the Savage south line; yet, although this may be considered a decided improvement in that respect, the ore itself does not improve in richness, but the average assays are not quite as high as to the south, where the vein is more condensed. This, the *Enterprise* thinks, is no unfavorable circumstance as militating against the possibilities or probabilities of finding a rich bonanza in the north half of Hale and Norcross, extending through into the Savage. All the bonanzas thus far found on the Comstock have been surrounded by plenty of low-grade ore, and none of them have commenced abruptly with high-grade ore when approached laterally in the vein. The approach to the famous Consolidated Virginia bonanza was through a long stretch of low-grade ore, and the 1,100 drift of Crown Point ran south a long distance in barren quartz and low-grade ore before it reached that rich bonanza of the south end. Perhaps it may be found advisable to sink for a still lower level in Hale and Norcross before the present ore vein materializes into a real bonanza or a paying mine.

Market Reports.

Lumber at Wholesale.

The Redwood Lumber Association has established no prices since the first of the year.

REDWOOD. Cargo prices are at present as follows: Rough, merchantable, ₱ M ft., $13 00; Rough, clear and surfaced, $23.00; 1x10 Rustic, No. 1, $24.00; 1x10 Rustic, No. 2, $19 00; 1x8 V Rustic, No. 1, $12.00; 1x6, tongued and grooved, $21.00; 1x4, tongued and grooved, beaded, $23 00; ½-in.x3, Battens (board measure), $30.00; Shingles, ₱ M, $1.65.

PINE—Rough, $15.00; No. 2, $12 00; do do in lengths, $13.00; rough, 40 to 50 ft lengths, $10.00; do 50 to 60 ft, $17.00; T and G Flooring, 1x6, $26.00; do do 1¼x0, $28.00; do do 1x4, $28.00; do do No. 2, $21.00; Vertical Grain T and G Flooring, 1x6, $30.00; do do do 1¼x6, $32.00; Stepping, $37.50; Furring, 1x2, per lineal ft, ¾ c.

Lumber at Retail.

Prices fixed by the association April 1st, are as follows:

Pine, Rough	$15 00
" " No. 2	12 00
" " " 2 in lengths	13 00
" " 40 to 50 feet lengths	16 00
" " 50 " 60 " "	17 00

A NEW WORK ON ASSAYING

Lead, Copper, Tin, Mercury, etc.

BY C. H. AARON.

For Practical Workers. Price, $1.75.

The new book is entitled "Assaying—Parts II and III," as Part I treated of Gold and Silver Ores alone. The book is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Mr. Aaron is an experienced metallurgist who has devoted many years to assaying and working ores on the Pacific side of the American continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores," and "Assaying—Part I") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of miners, assayers, prospectors and millmen.

The following abstract of the table of contents will show how comprehensive the work is: Gold and Silver Bullion; Apparatus; Melting Bullion: Assaying Bullion: Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Xanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, $1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

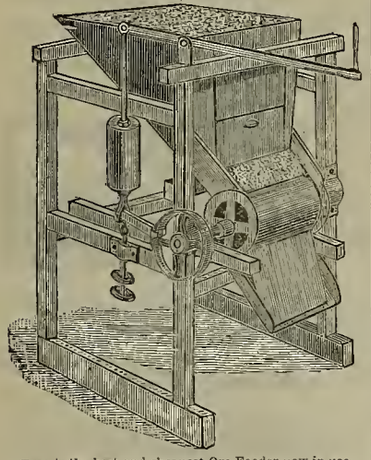
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers,

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and otber countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are tbe SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

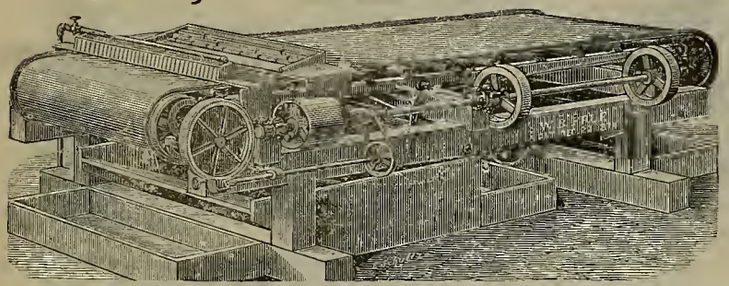
CHICAGO PLATING COMPANY, 21 Stevenson Street.

JUSTINIAN CAIRE, Dealer in Mining Material, Agent, 521 and 523 Market St, San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!

THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

RANKIN, BRAYTON & CO.,

....BUILDERS OF....

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

VOLUME XLXX Number 20.

Dow's Improved Pumping Engine.

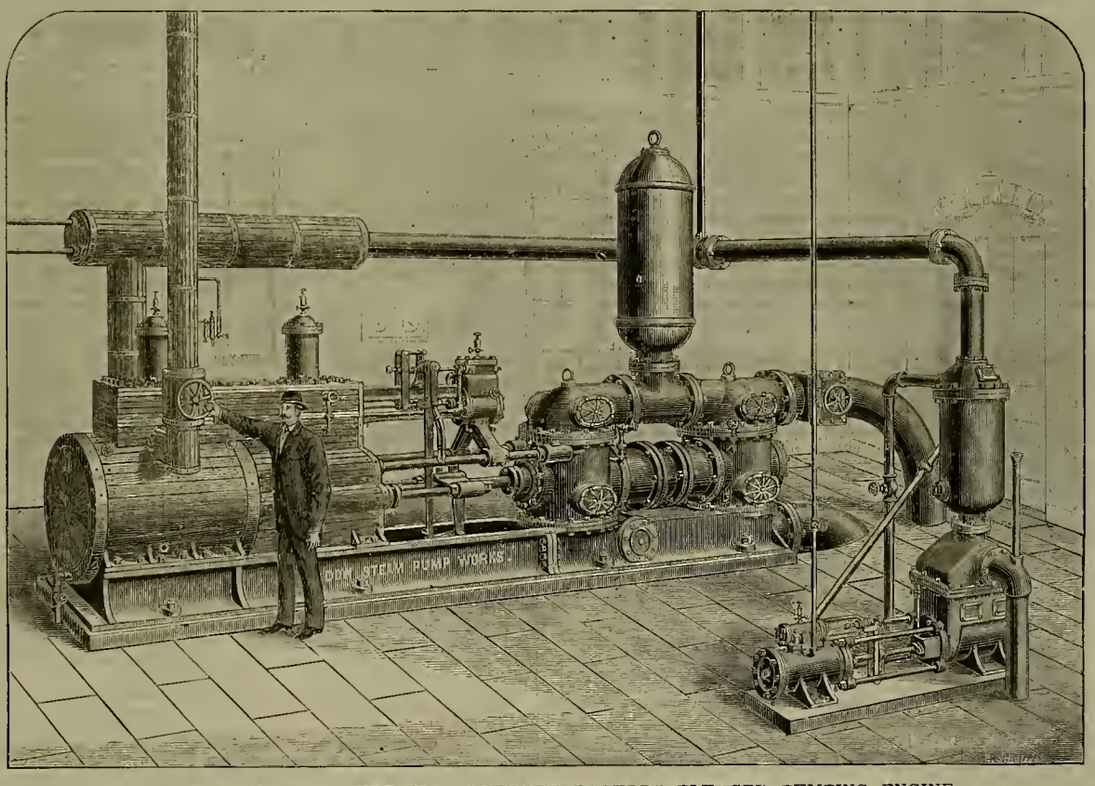
Among the great variety of adaptations in pumping machinery manufactured at the "Dow Steam Pump Works" in this city, we call the attention of our readers to the special construction of compound pumps with independent condensing apparatus, suitable for water-works purposes.

The cut shows the general arrangement of a first-class compound and condensing "outside packed" plunger pumping plant for high service, developing the greatest economy. These pumps operate smoothly under the heaviest lift. The operating expenses and repairs are remarkably small, while the chances for derangement are reduced to a minimum.

The firm is adapting this class of pumping engine, of either the piston or plunger pattern, to both high and low service, and guarantee for the outlay the highest possible degree of economy. A large number of their plants are now in successful operation in California, Oregon, Washington Territory, Arizona and Mexico, and are very strongly endorsed by engineers of the most approved experience as superior in every way.

This class of pumping engine with independent air pump and condenser, as shown, is applicable, with such modifications as are best adapted to the peculiarities of each situation, to either high or low service water-works purposes of either the reservoir, stand-pipe or direct pumping systems. No expensive foundations are required. This class of pumping engine is applicable to daily capacities of 200,000 to 2,000,000 gallons and upward. The pump of which the accompanying engraving is a representation began its work by pumping 100,000 gallons an hour at the Seattle water-works.

This is only one of the varieties of steam pumps made by the Dow Steam Pump Works, which from a small beginning a few years ago has grown to large dimensions, the pumps having come into great favor by their efficiency and durability.



DOW'S COMPOUND CONDENSING "OUTSIDE PACKED" PLUNGER PUMPING ENGINE.

"The Compulsory Coinage of Silver" is one of the subjects to be discussed at the National Commercial Convention, at Atlanta, Georgia, on the 19th inst. Colorado will send representatives so that the silver side of the question will have suitable adherents.

D. W. F. Bisbee, of the firm of Bisbee and Williams, engaged in copper mining operations in Arizona, died in this city last week. He gave the name to the town of Bisbee, Arizona, and was well known all over the Coast in the mining regions.

Foundry Notes.

At the Fulton Iron Works, Hinckley, Spiers and Hayes have just shipped a 30-stamp mill to Mexico. The mill is to be run by water-power, turbine water-wheels being used. The entire frame of the battery is made of iron, as wooden frames shrink out of shape in that hot country. The castings are all made small, for handiness in transportation. They are putting up a 5 stamp mill at Digget, San Bernardino county. It is a silver mill with pans, settlers, etc. The Works are doing the whole thing, milling and all.

Two large steel boilers are being finished up for the U. S. Coast Survey Steamer Hassler. They are also building the machinery for a new steam schooner for the coastwise lumber trade. The machinery is heavier than any so far put into the coasting schooners for auxiliary power. It is a vertical compound surface condensing engine, with a 11-inch high-pressure cylinder and 22-inch low-pressure cylinder, 22-inch stroke. The boiler is 8 feet in diameter and 9 feet, 6 inches long.

Among other marine work is the machinery for the new steamer General Grant which is to be used by the fishermen outside the heads. No sails are to be used on the vessel and no masts have been put in. She is to go outside and bring fish in every morning. The steamer is of good size and nearly ready for use. A small steam engine is to be used for hauling nets.

This foundry is doing about 750 tons of casting work for Peter Donahue's new building on Mission street between Fremont and First. It consists mainly of columns and fronts. There are about 250 tons of interior columns in the job.

Manufacture of Sulphate of Alumina.

In the manufacture of sulphate of alumina the aluminous materials, such as schists, clays, etc., are treated in the powdered state, either before or after roasting, with the requisite amount of either cold or hot sulphuric acid. In most cases a violent reaction will ensue and the aluminous material will be decomposed by the action of the acid, by which silica will be set free, and a combination of alumina, and of such other bases as may be present formed with the sulphuric acid, whereby will be produced a more or less pure sulphate of alumina. This product may be either run into cakes, which, after hardening and after being more or less broken up, will form an article of commerce known as "aluminous cake"; or, after diluting said product formed by the treatment of aluminous materials with sulphuric acid with water, the silica may be allowed to settle, the clear supernatant liquor drawn off and boiled down, or concentrated to such a strength that it will get hard when cold. The product of each of these processes is the sulphate of alumina of commerce. Sulphate of alumina as usually made contains more or less free acid. This free acid is an objectionable feature and is positively harmful when the alum cake or sulphate of alumina is to be used as a sizing material in the manufacture of paper. It will corrode the apparatus employed and destroy in a greater or less degree certain materials used in the manufacture of paper, such as ultramarine blue. It is necessary to have a neutral or basic solution of sulphate of alumina if it is desired to remove iron therefrom by some of the known processes for this purpose.

Conrad Semper, of Philadelphia, has recently obtained several patents for manufacturing sulphate of alumina. By one of these patents he produces a neutral porous sulphate of alumina containing magnesia, for sizing and other purposes. This patent covers the process of making a neutral porous sulphate of alumina, containing sulphats of magnesia, which consists in treating a hot solution of sulphate of alumina of such degree of concentration that it will harden when cold with carbonate or bicarbonate of magnesia. In another patent he covers the method of making a neutral or basic alumina-magnesian compound which consists in treating a hot acid solution of sulphate of alumina with magnesia carbonate, bicarbonate or oxide. This neutralizes the free acid present. The magnesia will unite with the free acid, as long as any remains, and after saturating all the free acid, if any surplus of magnesia should be present it will take up from the neutral sulphate of alumina as much acid as will be necessary to transform all the magnesia present into a sulphate of magnesia, leaving a soluble basic sulphate of alumina intimately mixed with the sulphate of magnesia thus formed.

The same inventor has a system of producing a *porous* sulphate of alumina containing zinc, and at the same time he obtains a neutral article in which the iron is reduced in whole or part to ferreous oxide, should ferric oxide be present in the clay from which the alumina is made he discovered that by adding a solution of ferruginous sulphats of alumina of such degree of concentration as that it will harden when cold, and just before it commences to thicken a certain quantity of sulphite of zinc, he obtains a mass in which the iron, which has been present in the aluminous material as ferric oxide, is reduced to ferreous oxide, and which is at the same time interspaced with small cavities, in which cavities sulphurous acid gas is contained. If this porous sulphats of alumina is used in paper-making it is readily soluble on account of its porosity. The claim allowed on this patent is, "The process of manufacturing porous sulphate of alumina, containing sulphite of zinc, which consists in adding sulphite of zinc to an aluminous solution made by treating an aluminous material with sulphuric acid, and from which silica has been removed, and which is of such degree of concentration as, when cold, to harden."

Mining Bureau Trustees.—Wm. Irelan has been chosen chairman of the trustees of the California State Mining Bureau, and Sol. Heydenfeldt, Jr., vice-president. The other trustees are Z. Z. Davis and Walter E. Dean.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Shasta County Mines.

EDITORS PRESS:—Shasta county was noted for the extent and productiveness of its placers in the early days of gold-digging. Even now placer mining is carried on in some sections of the county with good results; and there is considerable territory that will pay from $1 to $1.50 per day as yet untouched. Treading in the footsteps of her sister mountain counties, however, Shasta county has learned that her hopes for the future must rest upon quartz, and that the benefits arising from placer mining are ephemeral and unsubstantial. From the developments already made in vein mining, a career of great prosperity is opening before her. The large production of placer gold, already referred to, presents convincing evidence of the existence of rich auriferous veins in the mountain system of this section. All who have studied placer gold deposits are satisfied with the simple and obvious inference that the gold has been derived from the erosion or wearing away of the higher rocks and the breaking down of quartz veins, the debris being sorted and deposited by water according to its specific gravity. We always find placers lying adjacent to and below districts traversed by auriferous veins, and nowhere else, and the placer gold itself shows traces of having been torn away from its parent ledge in its rolled and rounded surface.

The actual results and developments of quartz mining in Shasta county bear out and confirm the geological facts above given. At the heads of the gulches which were rich in placer gold, fine veins of gold-bearing quartz have been discovered and profitably developed.

French Gulch is a striking case in point. This gulch paid at the rate of $100 to the running foot to the old gold diggers for its entire length. At the head of the gulch rich quartz was first struck in the Washington mine. This mine has been worked for many years with great success, and an immense amount of underground work has been accomplished. Owing to the tunnel system without air-shafts for ventilation, foul air has accumulated to such an extent in the lowest workings that the extraction of ore is slow and costly. By proper modernized methods of development there is no doubt that this mine could be made very productive. The improvements consist of a good 5-stamp mill operated by water-power. Following up the gulch the Niagara mine is reached. This is a consolidation of numerous pieces of ground, all owned by a San Francisco corporation known as the Niagara Mill and Mining Company, in which Mr. W. T. Coleman is the leading spirit. There are a 10-stamp steam mill, and a cannon-ball mill on the premises, with an aggregate crushing capacity of about 30 tons per day. The mine is a close corporation and bullion yield is hard to obtain, but outsiders put it at $20,000 per month. About 60 men are employed, all white, Mr. Coleman showing a preference for white miners, which is in marked contrast to some mine-owners who employ Chinese to the detriment of the mines and the demoralization of the young people and children in the immediate vicinity.

Near the Niagara is located the Scorpion mine, a promising claim; the Meyers claim, which shows up a large body of ore estimated at $100,000; the Green mine, running regularly with a cannon-ball mill; the Brunswick and other good mines. The formation is slate and porphyry, and the ore is generally found on the contact. The average is high, say $40 per ton. The ores carry a considerable percentage of sulphurets, which are rich in gold.

What has been demonstrated by following up French gulch has been repeated in other parts of the county. Squaw creek has been followed up to its source and large and valuable veins of quartz discovered. Some of these are from 6 to 10 feet in width and pay the fortunate discoverers good daily wages, with a hand mortar. On the south side of Squaw creek, at an elevation of about 700 feet above the bed of the stream, is situated the celebrated Balaklala mine, which is destined to become famous in the annals of gold mining. This is one of the largest veins in the county. It is believed to cover the whole surface width of the claim, 600 feet. At any rate, no walls have yet been found. The ore is rusty, black, porous gossan, carrying free gold and metallic silver. The average value per ton in gold is $12.50, and in silver $15. The presence of the silver is owing to the decomposition of nodules of silver sulphurets scattered through the mass, while the gold seems to be associated with the iron ore, resembling in this respect the remarkable gold mine recently discovered in Queensland, Australia, and leading to the belief that the precious metal has been deposited by geyser springs coming to the surface bearing in solution gold, silica, iron, alumina, etc. There are at least 75,000 tons of ore developed at present. Milling operations will soon be inaugurated. It is estimated that $4 per ton will pay all costs of mining and milling. Estimating the yield at 80 per cent of assay value and we have $22 per ton. Deducting from this $4 per ton for working, and we have $18 per ton profit, and "in sight" a profit of $450,000. The formation is feldspathic porphyry, in some places showing beautiful deposits of kaolin. This mine is one of the remarkable sights of Shasta county.

On the eastern side of the Sacramento river in the "Old Diggins," many valuable gold quartz mines are in operation, the leading ones being the Florida, O'Neal, Mammoth, Central and Harrison. In the southern portion of the county near Ono, on the Cottonwood creek, the principal gold quartz mine is the Spencer, situated about eight miles from Ono. Here considerable work has been done and a large body of quartz uncovered. At present the pay chute is nine feet in width, averaging $30 per ton. Defective milling facilities have heretofore retarded development. A good stamp-mill is to be erected this summer and then the yield of this mine will add greatly to the bullion product of the county. The vein lies between slate and porphyry.

At Bullychoop, above the last mentioned mine, considerable prospecting work is being carried on and good gold specimens are occasionally brought in. Owing to the mountainous nature of the country development is slow, but a good wagon road is now under construction.

The shipments by Wells, Fargo & Co's Express for 1884, of gold dust and gold bars from Shasta county amounted to $360,568. When we take into the account the amount carried out by private hands, the aggregate will reach nearly $500,000. The present year will witness an increase of 50 per cent on this amount. The outlook was never better for quartz production. Shasta possesses good climate, cheap labor, railroad transportation throughout its entire length, with an abundance of water-power, as well as cheap fuel for steam and mining purposes, and it presents to-day a most attractive field for investment. B. B. M.

Redding, Shasta Co., May 5, 1885.

Too Many Miners at Butte.

EDITORS PRESS:—You will confer a great favor to many miners throughout the country by warning them through your excellent paper against coming to Butte in search of work. There are at present hundreds of idle men here unable to get work, and more are coming in every day, induced thereto by the rose-colored representations in the local papers about the boom and prosperity Butte is enjoying.

The fact of it is that while there are a few buildings going up, three or four of the best mines which but lately employed 200 and 300 men are now shut down, the Lord and the managers only know for how long. The men are running in gangs here from two and three up to a dozen, and as many as 20 and 30 can be counted at one time round every hoisting work supplicating for work which they cannot get, and those who are "busted" have a hard time of it "sparring" round for one square meal a day. Almost every one of them are pouring sulphur-perfumed blessings over the city and wanting to get away, but having no money and not wanting to count railroad ties on an empty stomach—they do the only thing left open to them, remain and burn it through. MINER.

Butte, Montana, April 30, 1885.

Arizona Mining Laws.

The Territorial law just passed provides as follows: That locators place a substantial stake or monument of a permanent character at each end of the ground claimed, and others as near as practicable along the course of the ledge, and also similar objects at each corner of the claim; said stakes to contain in a conspicuous manner the name of the claim and notices to be placed in monuments as heretofore. The line of stakes along the ledge shall not afterward be changed so as to affect the rights acquired by others. All locations must be recorded within 60 days.

Recorders are to receive for recording the sum of one dollar for the first folio, and 20 cents for each additional folio. It also provides for the indexing of all locations made and to be made.

It further provides that before 60 days after the period fixed by the United States law for annual expenditures (assessment work) upon claims, claim-owners may file with the Recorder of the county an affidavit setting forth that the full amount has been expended, as required by law, and containing a concise description of the character of such work, and in and for what year. From the time of the filing of such affidavit, the same shall be *prima facie* evidence of the facts therein stated, and shall impart notice thereof to all persons; also, when one partner does not come to time with his part of the assessment work, the other may do it and file notice of having done the same with the Recorder, he to keep an alphabetical list of such affidavits.

This law applies to placer claims.

The law goes into effect three months from the date of its passage.

The Bellevue *Chronicle* is informed that the Philadelphia company will this season erect a large concentrator and matte furnace out at their Little Smoky properties. The concentrator is already en route.

The Sierra Buttes Gold Mine.

Working Low-Grade Gold Ore in California.

The Sierra Buttes Gold Mining Company is an English organization, working mines in this State. A general meeting of the company was held in London last month, when some interesting facts were presented.

The chairman, Mr. F. Tendron, said before moving the adoption of the reports and accounts, he would give them all the information in his power regarding the working of the past half, and the probable result of the present half-year, and as far as one could see a short way into the future. The tonnage stamped during the past half-year was 29,740 tons, a large increase as they were led to expect over the average of former periods for some time, at all events for several half-years. The value of the gold and silver in that mineral was $6.12 as against $7.50, the average of seven preceding half-years. In English money, and taking the the dollar at 4s., for convenience's sake, it was 24s. 6d. against 28s. 2d., a falling off as they would see, and small as the falling off was it was of considerable importance, but the reason of the falling off was a satisfactory one in its way. It was not that there was a falling off during that period in the value of the ore from the Mammoth shoot, or of the ore from the bodies between the eighth and seventh levels. The ore stamped in the Yuba was entirely ore taken from between the eighth and seventh levels, and that averaged $7.50 a ton, which was a very good average. He thought almost all of the reports they had had as to the probable value of the ore of the Mammoth shoot gave the average at something like $7 to $8; so far it was satisfactory, but the ore that was milled in the Hitchcock mill, the bulk of which was taken from the seventh level, was of poor quality. The bulk of the ore was taken from various parts of the mine along the main shoot, which was known to be poor between the seventh and sixth levels. The average of the ore crushed by the Hitchcock mill was only $4.21, or about 16s. 10d., per ton. Poor as this was it gave a profit and reduced the average working cost.

The average working cost for the six months was $3.20—15s. of our money, as against $4.43 or 17s. 10d. of our money, so that poor as the ore was it still gave a profit of 1s. 10d. a ton, and brought the mining and milling costs down considerably because of their being enabled to stamp a much larger quantity of ore. In these figures he had excluded the expenditure on the 9th level; it was an exceptional expenditure, an expenditure that was entirely for the future. A very fair amount was charged during the period for prospecting and dead work. The amount thus expended, in addition to the amount they had charged as outlay on the 9th level, was close upon 9,000*l.*, so that it really had been a very satisfactory half-year to have been able to spend on developments 9,000*l.*, and yet show a balance of profit and loss for the half-year of 6,500*l.* That was a very fair half-year, but with such good figures they might very fairly say: "Why, then, don't you give us a dividend at the rate of five per cent, which would take but little over 6,000*l.* out of 6,500*l.*, you show as a net balance for the working of the half-year, and particularly as you promised us a better dividend?" He owed them a very full explanation of why; after due consideration they came to the conclusion that they should only pay a dividend at the rate of two and a half per cent per annum, the same rate of dividend as they had been paying for a short time previous. Those reasons were partly mining and partly financial. He would deal with the mining reason first, premising what he was going to say on the point, with the remark that it was very undesirable to increase the rate of dividend unless they saw that they could maintain the increased rate. The mining reasons were chiefly arising from the horse which had split the lode in the 8th level much sooner than anticipated. He told them what the result was at the last meeting, but he said that he felt, as far as a man could feel, satisfied with that which he could know little about if they could find a good ore west of the horse; and they had gone through a period since that meeting with a certain amount of anxiety to have that expectation fulfilled. Up to the time they had decided on the rate of dividend it had not been found. The expenses were very heavy, driving in the body of the quartz, in addition to the expense of driving under the footwall. They had driven the tunnel a considerable distance, a fair distance in the hard body of quartz, but up to the time they had to decide on the rate of dividend they had not met paying ore. They got a vein which was good and contained sulphurets and a little gold, but not enough to pay. He was very happy to say they had good ore now in the lateral drifts which ran nearly parallel. They had a fair body of ore there and in the selvage; they were driving in the footwall; they had also a body of ore now making its way upward. They met it in the floor of the tunnel. It was gradually rising, and the latest news they had was that it was about four feet wide, 6-dollar ore. So far they had reason to be satisfied, but in the meantime the produce had been below the average. The quality of ore that they had been obliged to work to keep the Hitchcock mill going, and the poorer quality of the ore they had met with in the Mammoth shoot and the inability to mix that with better ore from stopes that they expected to have had above the house, had brought down the average monthly produce to something like $30,000, and the very heavy expenses of driving the lateral drifts to the eighth level and the seventh level, and the necessity now of charging the expenses of the ninth level also to the revenue, left too small a profit for three months' working of this half-year for them to see their way at all clearly to carry out the financial undertaking that they had made, and give the shareholders at the same time a dividend of five per cent. They could have given five per cent on this occasion, but they could not at present see that they would be able to give it in October.

As soon as the additional twenty stamps were fitted up in the Yuba mill, which would be in about May, they would stamp at the mill about 4,500 tons a month; they would probably shut down the Hitchcock mill. There was very little ore more than it could work, and such ore as it got at the eighth and seventh level it got at a heavy expense, and they could send that along the eighth level into the mill as that they would probably shut down the Hitchcock mill, and merely work the Yuba, where we have 60 stamps, and be able to stamp 4,500 tons a month. Taking the average value of ore at as low a rate as $7, they would then be able to earn a monthly sum of between $11,000 and $12,000. From that amount they really had to take off a certain amount for agency expenses, bullion charges, debenture interest, income-tax and London charges, so that they must not be guided by the figures they received and suppose it was an amount available for dividend. The only doubt in his mind was whether, so soon as the 1st of July, they would have laid open sufficient bodies of ore to enable them to feed the mill with such a large quantity as 4,600 tons monthly, and how it was that they had to consider what might reasonably be expected as this amount of ore that would be laid open by the ninth level. That level had been driven now for over three years, and had cost them 20,000*l.*, of which they had paid 20,000*l.* out of revenue, and it had not, up to the present, benefited them to the extent of a single sovereign. It had not yet reached the ore bodies that they had driven it for the purpose of reaching. The first ore body would probably be met with in the course of the next two months. The first body that was met with in the 8th level was at the junction of two veins, the North Cliff and the Ariel. The 9th level was being driven in the Ariel, whether the North Cliff would be near it or not they could not say; if not, they would have to drive a cross-cut to meet it. There was one other matter that he had to bring before them that he thought was of a very satisfactory nature, and would certainly help them very much in obtaining the returns he had alluded to, and that was the successful treatment of the sulphurets that had been found in the 8th level by the chlorinating process. It would be seen by the report about four tons had been treated in that way, and they gave a net profit of something like $320. They had accumulated about 150 tons of the sulphuret tailings, which Mr. Johns put down as being worth £6,000. That was a most important thing, and Mr. Johns hoped to make a permanent profit from the same source, and if that were the case there would be no question as to their ability to carry out the scheme he had mentioned of being able to pay a dividend of 5 per cent, and in two years discharging the £20,000 of obligations. Referring to the Plumas Eureka, he told them at the last meeting, although they had to submit to a reduction in dividend, he could not feel at all desponding of the future of the Eureka mine, and although things did not look very brilliant, yet such a good body of ore had been opened out in the outside mines that they might cheerfully look forward to the future, but they might expect, during the half-year, or early part of the present year, some very low returns, and they would be dependent on the Eureka mine proper, and the ore available would be small in quantity and poor in quality.

That had been the case; nearly 80,000 tons had been stamped during the half-year, and about 10,000 of that came from the Eureka proper and was of poor quality, to their great surprise; and much to the surprise of their officers abroad, they had been able to work the outside mines all through the winter right up to the present time, and the result had been that they had made uncommonly good profits. The produce in free gold and silver at the Plumas for the six months was at the rate of 7.27 per ton, as against 6.92 for the preceding seven half-years, and the mining and milling cost was 4.32 against 3 73. The cost was above the average, because of the large amount of prospecting and dead work that had been done in connection with the Eureka tunnel and with the outside mines.

LET HER BOOM.—The Downieville *Tribune* says: Judging by the talk we heard in San Francisco, Sierra is attracting more attention in the mining circles there than any county in the State. And why not? There are rich gravel channels threading their way through all these mountains, and there are thousands of untouched quartz ledges that are simply waiting to yield their treasures to the delving miner. If we mistake not the signs of the times, there will be a boom in mining in this county this summer. Let her boom.

About 24 tons of concentrations have been shipped to Colorado from the Paradise Company since the rebuilding of its works and the resumption of the reduction of its stores of ore.

MECHANICAL PROGRESS.

The Nail Trade.

Less than a century ago all nails were hand made. Now there are 80 nail factories in the United States running over 6,000 machines, with a capacity, if all were steadily employed, of over 12,000,000 kegs per annum. The largest annual product was 6,147,000 kegs of 100 lbs. each in 1872.

Nails are made in some 17 States of the Union. Among the latest States to enter upon this industry are Wisconsin and California. The latter entered upon nail-making in January, 1883, with 50 machines.

Nail Imports of California.

Up to within the past two years, all the nails used on this Coast were imported from the East. The imports at San Francisco in round numbers for the past twenty-two years have been as follows:

1863, kegs	95,000	1874, kegs	215,700
1864	94,400	1875	232,100
1865	70,300	1876	181,800
1866	103,100	1877	213,000
1867	190,800	1878	223,000
1868	158,200	1879	162,000
1869	170,600	1880	192,800
1870	103,900	1881	259,800
1871	150,200	1882	200,700
1872	225,000	1883	178,200
1873	129,000	1884	101,700
Total, 22 years			3,651,300

The imports for the last eleven years show an increase of 45 per cent over the first eleven years. The real increase has been larger, because some of the cities of the interior, which formerly drew their supply of nails from San Francisco, have lately been importing considerable quantities direct from the East. Over 30,000 of the import of 134,000 kegs by California in 1884 dropped off at the various terminal points in the interior.

Nail-Making in California.

The estimated annual consumption of nails in California has varied from 85,000 kegs in 1865 to 259,000 kegs in 1883. These figures show a monthly consumption varying from 7,500 kegs to 21,600 kegs. Dealers have been accustomed to carrying a stock of 6,000 to 60,000 kegs. Now that supplies are obtainable in California, the hardware men allow the manufacturers to carry the burden of stock. It will probably be a long time before California cuts entirely loose from Eastern supplies of this manufacture, though it is stated that the local factory has sufficient capacity to meet all the demands of the Coast.

This factory is located at Oakland, and was erected in the closing months of 1882. It is supplied with the latest improved machinery. The building is two stories high, and the machines are placed in the second story, the nails dropping through apertures in the floor to reservoirs on the first floor. A rolling-mill is attached to the works, so that the iron is prepared and all the operations completed at the same point. There is also rail connection direct from the factory with all parts of the country. The factory has encountered the usual obstacle incident to the introduction of manufacturing enterprises in California. There have been two or three strikes among the workmen concerning wages, but everything is now running smoothly. The factory made about 100,000 kegs in 1883, and 129,332 in 1884. At the close of 1884 the factory held a stock of 21,561 kegs. The managers expect to make 200,000 kegs in 1885, and claim that the factory has a capacity for 300,000 kegs. Despite this outlook from the local factory standpoint, it is probable that at least 100,000 kegs will be received at San Francisco from the East this year.

Steel Nails.

We understand that the Oakland factory has recently added a line of French wire nail machines, and is now prepared to turn out all kinds and sizes of this description. The demand for wire nails has become quite prominent in the last three years, and we are glad that they are now made here. They are largely used by sash, door, furniture and organ manufacturers, picture-frame makers, car-builders, and house and office furnishers. They are quite stiff and can be driven into hard wood without the nee of a brad-awl. They number more to the pound, and are therefore considered cheaper than other sorts.

The Pacific Iron and Nail Company undertakes to make every nail known to commerce. The enterprising gentlemen who started this industry on our shores deserve well of their fellow-citizens, and it is a pleasure to know that their efforts have been appreciated. The wonder now is that a nail factory was not started here ten years earlier. It meets a long-felt want of this city and Coast.

Steel Nails.

Within the past two years some of the Eastern factories have been making steel nails and tacks with more or less success, but whether steel will run out iron in this line of manufactures remains to be seen. It is to be regretted, says the *California Architect*, that some of the iron nails sold in this market in the past year have been of very poor quality. We do not know where they were made, but have seen them bend and break rather than enter the wood in which they were being driven by those accustomed to the use of hammers. A poor nail is about the most provoking thing in existence, and there is no excuse for their manufacture. We have heard no complaint concerning the product of the Pacific Iron and Nail Company, and it is fair to presume that the poor nails have come from abroad.

Late advices received from manufacturers of nails indicate that the demand for steel nails is so much greater than for iron nails that quite a number of nail manufacturers are abandoning iron nails and making only steel nails. This statement does not apply simply to those who have steel plants connected with their works, that is, to the Bellairs and Riverside. In the Wheeling district, for example, the Jefferson Iron Works and the Junction Iron Company have definitely abandoned the manufacture of iron nails, and will henceforth make only steel nails. At Wheeling all the mills are making steel nails to a greater or less extent, and most of them have practically abandoned the manufacture of iron nails. This grows out of the fact that the demand for steel nails is so much greater than that for iron nails that their iron nails remain untouched in the warehouses, while the steel nails in most cases are sent out as fast as made. Some jobbers still ask for iron nails, and when they do are furnished them, but the great majority only ask for steel nails.

Progress in Iron Founding

The art of producing iron from its ores, and of remelting the iron to forms, has always been of an experimental character, owing to the lack of certainty as to its component parts and their proportions. Irons themselves differ in composition so greatly that it is one of the most exactive of arts to produce an unvarying grade for certain and demanded purposes; and the ores vary so much in the same mines that those coming under the same generic, and even specific, terms are not always analogous. As an instance the Black Band ore mined at Mineral Ridge, Trumbull County, Ohio, is of one character when found under the sixth coal level, and of an entirely different character when appearing as an outcrop near the surface, where it is scarcely better than "kidney" ore or the ordinary "shell" ore, both of them too much oxidized of much value in the mechanic arts, except as makeweights. In fine castings, especially those of light weight, there is wasted usually about 700 pounds out of a ton of castings. It is evident that the intelligent selection of irons and fuels, and especially the determination of the character of ores by analysis or experiment, ought to reduce the present uncertainty of product and insure a result in accordance with the foundryman's design. This has been the endeavor of Mr. J. B. Renshaw, of Hartford, Conn., who has made a study of ores, their fluxes, the resultant iron, and the after-casting his business for several years. At length it is said that he has succeeded in putting the work of the foundry on a basis that removes it altogether from the line of speculation and experiment, and relegates it to one of the exact arts. His results from his studies are accepted in practice by a large number of manufacturers who make their own castings, and also by the managers of a number of blast-furnaces who reduce iron ores for castings and for the puddling furnace. These results are only a portion of the outcome of several years of experiments and investigations; the most important parts are those which determine for the practical foundryman the sorts of iron he should use to produce his desired result, and the proportion of the different irons.

INFLUENCE OF ANNEALING UPON THE MOLECULAR STRUCTURE OF IRON AND STEEL.—The magnetic balance shows that annealing not only produces softness in iron, and consequent molecular freedom, but it entirely frees it from all strains previously introduced by drawing or hammering. Thus a bar of iron drawn or hammered has a peculiar structure, say a fibrous one, which gives a greater mechanical strength in one direction than another. This bar, if thoroughly annealed at high temperatures, becomes homogeneous in all directions, and has no longer even traces of previous strains, provided that there has been no actual mechanical separation into a distinct series of fibers.

The highest degree of softness in any variety of iron or steel is that obtained by a rapid heating to the highest temperature less than fusion, followed by cooling in a medium incapable of changing its chemical composition. The time required for gradual cooling varies directly as the amount of carbon in alloy. Thus in absolutely pure iron rapid cooling, as in tempering, would not harden it, while steel might require several hours or days, even for pieces only 1 mm. in diameter. Slow cooling has no injurious effect upon iron when cooled in a neutral field; consequently, where time is no object, we may employ slow cooling in every case. A wire or piece of iron thoroughly annealed must not be bent, stretched, hammered or filed; the hardening effect of a bend is most remarkable, and the mere cleaning of the surface by sandpaper hardens that surface by several degrees on the scale.

GIANT PULLEY.—A grooved fly-wheel of remarkable size and weight is in course of manufacture by Messrs. Goodfellow and Matthews, of Hyde, England. The diameter is 34 feet and the weight 83 tons, while the circumferential velocity will be 5,350 feet, or over a mile a minute. The face is grooved for 32 ropes, each 1¾ inches in diameter, and capable of driving 40 horse-power. The fly-wheel is intended for the factory of the Ashley Mills Company, near Hyde Junction, and is made in 50 pieces.

SCIENTIFIC PROGRESS.

Man in Geological Eras.

The laws of nature are immutable. Cause and effect are inseparable. No particle of matter is exempt from them. Then, to examine and comprehend all the forms, conditions and properties of our material surroundings, though as easy as talking prose, is called scientific research, and the knowledge thus gained is called science.

One of the most superficial or recent formations are the Danish peat-mosses, which vary from ten to thirty feet in thickness. "In this," Lyell says, "at various depths are found the trunks of trees, especially the Scotch fir (*Pinus sylvestris*), as much as three feet in diameter. This tree is not now, and has not in the range of history been, a native of this island (England), and will not grow here now when transplanted. But it grew here within the human period, for Steinstrup found, and removed with his own hands, a flint instrument from beneath the trunk of one of those pines." The Scotch fir-tree, now extinct in that region, was followed by several species of oak (*quercus*) appearing successively at higher levels in the peat, and these in turn have been almost supplanted by the beech, which has been indigenous to that locality as far back in time as history extends. And yet, all the land and fresh-water shells, and all the mammalia found in Danish peat are of recent species. So we can begin to learn something of the age of a species.

The great antiquity of man is further attested by the chronological succession of materials used for making implements and by the rude character of the utensils. These periods are called successively the ages of stone, of bronze and of iron. The age of stone, as we have seen by the flint implement found under the trunk of the fir-tree, coincides with the period of the first vegetation in Denmark. The age of stone was succeeded by the age of bronze about the time the fir-tree was supplanted by the oak in that region. These two ages passed and were succeeded by the iron age and the beech-tree before history began. Flint implements were recently found near the Seine, in the vicinity of Paris, imbedded in gray diluvium, twenty feet below the surface. In the cavern of Arcy-sur-Yonne human bones have been found with the bones of extinct quadrupeds. Flint tools have been found imbedded with the bones of the rhinoceros and the hyena, 30 feet deep in gravel resting on the chalk at Abbeville, Amiens, and other points along the valley of the Somme. In a cave near Torquay, called Kent Hole, the bones of an extinct mammoth and flint tools of a very antique type were found mingled together in the stratum; above these were human remains, all in a matrix of red loam, and covered with stalagmite. In the Brixham limestone are caverns in which were found in a floor of stalagmite the humerus of the *Ursus spelæus* (cave bear), and still under it various flint implements; here, again, it is clear that man lived before the cave bear, which is now extinct. On the banks of the Meuse are the caverns of Engis and Engishial, both containing the bones of man and various extinct species of animals.

Many more evidences of the antiquity of man might be adduced, but already enough has been presented to show that he has outstripped most of the species of animals in the race of life that may have come into existence with him. Geology and archæology have taught us that man far antedates history, and was contemporary with many species of animals known only by their fossils. That he roamed along the banks of the Somme, Thames, Clyde, Rhine, Seine, Mississippi and the Po, and scattered stones rudely fabricated by his hands into utensils, as early as the pliocene period, and when the beds of those rivers were one hundred feet, and some of them one thousand feet, above their present level, there is no reasonable doubt.

The great and varying depth at which some tools have been found in the same locality shows that the stone period was ages in duration. Finally man became enlightened enough to work copper and tin into bronze, and this metal was used for making weapons at a time anterior to the founding of the Roman empire. Geologists calculate that it required thirty thousand years for the peat in the valley of the Somme to grow. Yet under this, and resting on the chalk, is a stratum of gravel containing stone implements. Fine canoes were found 20 feet deep under one of the principal streets of Glasgow; evidently that ancient city stands on ground which in pre-historic times was the bed of the Clyde. In the valley of the Nile a brick was found at a depth of 60 feet with the name of the Egyptian god, Amen Ra inscribed on it. Another brick was found in the delta which, according to Lyell, must have been burned 30,000 years ago.—*Phrenological Journal.*

COMPRESSIBILITY OF LIQUIDS.—From a paper recently presented to the Academy of Sciences of Berlin, by Mr. Quincke, it appears that the compressibility of liquids, which is generally considered to be practically *nil*, may be shown under pressures of even less than one additional atmosphere. Mr. Quincke experimented with liquids contained in glass bulbs, with a capillary tube attached to them vertically; the bulbs were placed in the chamber of an air-pump, and the decrease of volume resulting from increased pressure was observed, which method promised more exact indications than the opposite one of watching the expansion under diminished pressure. Water carefully freed from air by continuous boiling was compressed by 49 millionths of its original volume under a total pressure of two atmospheres. The following figures express the compressions of some liquids resulting from one millimeter additional pressure, also in millionths of the respective volumes: Glycerine, 0·03; olive-oil, 0·07; alcohol, 0·12. The observations, which extended over a large number of liquids, agreed well with one another of former, but not such extensive, researches by M. Grassi. Within the limits of pressure of one additional atmosphere the compression remains proportional to the pressure. The experiments further confirm the theory that a certain relation exists between compression and the coefficient of refraction, but as yet they are not decisive enough, whether one or the other of the various ratios, which have been based upon theoretical calculations, is correct.

How Rain is Produced.

The origin of rain is from the condensation of a portion of the vapor in the air which forms a mist or cloud. Generally this condensation proceeds slowly, and the clouds which result do not furnish rain. When this condensation takes place with sufficient rapidity, the small particles of mist increase in diameter by the condensation of more vapor, and forming drops of considerable size, descend to the earth in a shower of rain. Rain is the condensed vapor of the air, and this condensation can only be caused by cooling the air below the temperature of the dew point. This reduction of temperature may be effected by radiation, or by the contact of warm air with the cold surface of the ground, especially the surface of mountains, or by the mingling of warm air with colder air. These processes are so gradual, or limited in extent, they probably never result in anything more than a fog or cloud. To produce an abundant rain, the air must be suddenly cooled below the dew point, and there is no way in which this can be done so easily as by forcing it up to an elevation of one or two miles above the earth's surface. The temperature of the air sinks about 35 degrees in two miles of elevation. If air from the earth's surface be forced to this hight, a large portion of the vapor which is carried up with the air must be condensed. This may be caused by a mountain or mountain ranges, or from the opposition of two currents of air. The rainfall is uniformly greater on mountains of moderate elevation than it is at the level of the sea.

DRY FOGS.—In the United States dry fogs frequently occur in November, or the latter part of October. This period is commonly known as Indian summer, and is characterized by a hazy condition of the atmosphere, a redness of the sky, absence of rain, and a mild temperature. This results from a dry and stagnant state of atmosphere, during which period the air becomes filled with dust and smoke arising from numerous fires, by which its transparency is greatly impaired. This phenomenon is not peculiar to the United States, a similar condition of the atmosphere being frequently observed in Central Europe. These fogs have been ascribed to the presence of fine volcanic ashes in the air. In 1783 such a fog prevailed over all Europe, and continued for more than a month. It was preceded by a remarkable eruption of Mount Hecla, in Iceland, which for a long time emitted smoke of unusual density. In 1831 a similar fog prevailed in the United States, in Europe, and on the coast of Africa. It obscured the air to such an extent that the sun could be observed all day with the naked eye, without the interposition of any colored glass. At night the fog seemed decidedly phosphorescent, and emitted an appreciable amount of light, which could not be ascribed to the reflected light of the stars.

INDESTRUCTIBLE LIFE.—A matter of surprise and wonder to those who witness it for the first time is the rousing to life of whole colonies of infusoria by the addition of a drop of water to a few grains of earth or dust. These microscopic organisms abound everywhere in water containing decomposing vegetable or animal matter, and some forms may, in a dried state, remain for months or even years apparently dead, to be revived when water is again supplied to them. Jabez Hogg has been experimenting during the past three years with one form of infusorial life—the rotifers or wheel animalcules—and has even kept dried specimens for a time at a temperature of 200 degrees Fahrenheit, and afterward exposed them to intense cold, neither process killing them nor greatly diminishing their vital powers. Mr. Hogg supposes that as the animal dries it shuts itself up like a telescope, its skin taking an egg-like shape, and that a secreting organ coats the body with a gelatinous envelope which protects it from further change.

LUMINOUS AND HEAT RAYS.—Dr. Tyndall states that of the radiant energy set up by a gas flame only the 1-25 part is luminous; the hot products of combustion carry off at least four times as much energy as is radiated, so that not more than 1-100 part of the heat evolved in combustion is converted into light.

HELIUM.—Lava from Mount Vesuvius has given, while examined by Dr. Palmieri, the spectrum line of "helium"—an element which until that discovery was recognized only in the sun.

TABLE OF CONTENTS.

EDITORIALS.—Dow's Improved Pumping Engine; Foundry Notes; Manufacture of Sulphate of Aluminum, 313. Passing Events; Moving Day; Retorting Amalgam, 316. Fifteen-Dollar Furnace; Silver Plated Amalgamating Plates; Electric Amalgam, 317. A Glance Over the Mining Field, 324.

ILLUSTRATIONS.—Dow's Compound Condensing "Outside Packed" Plunger Pumping Engine, 313. Fig. 1—Mexican Cupellation Hearth—Section at Right Angles to Fig. 2; Fig. 2—Vertical Section at Right Angles to Fig. 1, 317.

CORRESPONDENCE.—Shasta County Mines; Too Many Miners at Butte, 304. Arizona and New Mexico, 316.

MECHANICAL PROGRESS.—The Nail Trade; Progress in Iron Founding; Influence of Annealing upon the Molecular Structure of Iron and Steel; Giant Pulley, 315.

SCIENTIFIC PROGRESS.—Man in Geological Eras; Compressibility of Liquids; How Rain is Produced; Dry Fogs; Indestructible Life; Luminous and Heat Rays; Helium, 315.

USEFUL INFORMATION.—Painted Floors; Concrete Walks; Long-Time Securities; Placard Beauties; The Electric Light and Gas; Solders for Aluminum; Making Butter by Electricity; Coffee-Colored Curtains; Sugar from Corn Stalks; To Make a Glue that will not be Affected by Moisture, 319.

GOOD HEALTH.—The Babyhood of Cocaine; The Safest Part of a Car; Overwork; To Extract Citric Acid from Lemons; Impure Milk, 319.

MISCELLANEOUS.—Arizona Mining Laws; The Sierra Buttes Gold Mines, 314. New Reduction Works; Wood River; Look Out for the Mining Interest First; On the Formation of Coal; The "Overland Monthly," 318. Building Materials, 319.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 320-21.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 324.

Passing Events.

New placer diggings are reported in British Columbia near the river Skeena. Thers have been, however, so many false alarms about placers in that region that reports from there do not attract so much attention as formerly.

So far as can be learned nothing very startling has happened at the New River mines, the scene of the latest excitement. Many men have gone in there and more are on the way but no astonishing results have been announced as yet.

There seems to he quite a revival of the Cœur d'Alene fever this spring, and a good many men are going in there. It is stated that regular shipments of gold dust are being made in considerable quantities to the U. S. assay office at Helena from these mines.

The Paradise Valley Company, Nevada, is the latest one having trouble with the wages question. Superindendent McCurdy was paying miners four dollars per day, and did not want them to work for less, hut he thought that carmen and those working on the outside sorting and handling ore should work for less. This caused the trouble and the mine has temporarily closed down pending a settlement.

Denver capitalists propose moving a thirty-ton smelter plant to Nogales, Arizona, provided the mine-owners in that vicinity can furnish 30 tons of ore per month for reduction.

Moving Day.

From the midst of dust and disorder, and punctuated by the strokes of the carpenters' hammers, as they are giving finishing touches to our new editorial habitation, comes our May Day greeting to the readers of the PRESS. We began the moving of our printing and editorial departments before April closed, and now a week of May is gone and yet arrangements in our new location are hardly complete. It has proved a great task to move such an establishment as that of the SCIENTIFIC PRESS has grown to he, hut nearly all progressive movements call for sacrifices, and we have cheerfully endured the discomfort, and the publishers have cheerfully assumed the large expense hecause it was clearly to he seen that it would he to the advantage of our readers and patrone that the PRESS ehould share in the general movement toward Market street, which is indisputahly the hackhone of the metropolie of San Francisco. So here we are with our large power press, with its folding and etitching and mailing annexes, and with onr small army of printers and other attaches of the mechanical department, and last and least of all our editorial forces, massed in spacious apartments adjoining our husiness offices and patent department at 252 Market street, corner of Front street.

The concentration of their husiness under one roof has long been the design of Dewey & Co., hecause of the manifest advantage of close association hetween the different departments of literary and commercial enterprise which they have undertaken and promoted with success. The beuefits of the chauge will largely accrue to the friends and patrons of the establishment in hoth hetter and quicker work in the husiness and mechanical departments, and we trust that even the editors, feeling the inspiration of the new and more agreeahle arrangements and environment, will do their work with increased spirit and zeal.

The fitting up of the new establishment and the transfer of material and machinery has occasioned the publishere au unusual outlay. Such being the fact, we are disposed to ask that our subscribers encourage them in the effort by a general tossing in of what they owe. The amounts are small, and can prohably be as easily sent as not if attention is called to it. The aggregate would he considerahle, and would be very acceptahle just at this time.

A few hundred new subscribers would favor us more than usual at this time.

We shall be at home to callers in a few days, and shall be pleased to greet all old friends and as many new ones as interest in our work and the general advancement of the industrial growth of our commonwealth may prompt to come.

NEW MEXICAN CORRESPONDENCE.—The descriptive letters on Carlisle and Malone mining districts of Grant county, New Mexico, written hy our traveling representative, arrived too late for this week's issue. They will appear next week. These districts are attracting the attention of minere and mining men throughout the West and South. The letters will he of special interest to mining men and also to Eastern readers of the MINING AND SCIENTIFIC PRESS, as they contain much information on the methods of mining and ore treatments of these districts.

There are not a half-dozen idle msn in Silver Reef, Utah, who really desire work. If a man fails to find work with one or the other of the mining companies, there is no trouhle in finding ground on which to chloride—in fact there are many good miners here who would rather chloride than work for anyhody else. The Southern Utah *Times* saye there are less idle men in Silver Reef than in any camp on the Coast.

Several rich strikes are reported in the mines north-east of Butte, Montana. It is a rugged, mountainous country, and ledges can be traced on the surface for miles. Some great developments are expected to take place in this region the coming summer.

S. B. MOREY, a well-known mining operator ou this Coast, died at Fruitvale on the 11th inst. He was at one time superintendent of the Yellow Jacket mine, and has been engaged in mining operations for many years in this State and in Nevada.

Retorting Amalgam.

By the ordinary system of retorting amalgam the quicksilver is distilled hy heat only and the quicksilver fumes are forced out of the retort by their own pressure. The condensation is effected by a Liehig cooler. The disadvantages of this system are, first, that at the end of the retortiog the retort must remain filled with the quicksilver fumes; second, that it takes a high temperature and a long time to remove all the quicksilver from the hullion; third, the condensed quicksilver contains a large percentage of black slum, which is merely quicksilver in a finely divided state. Mr. C. A. Stetefeldt, the well-known metallurgist, formerly of this city, hut now a resident of New York, has devised a new system of retorting amalgam, which consists in forcing the quicksilver fumes out of the retort hy means of a steam blast, condensing eteam and quicksilver togcther, and conetantly circulating a stream of air through the retort and condenser. The effect is that at the end of each retorting no quicksilver fumes are left in the retort; the retorting is done at a lower temperature and in lcss time, and the condensed quicksilver does not coutain a trace of the black slum mentioned ahove.

To carry out this method of retorting a cast-iron retort of the usual form is set into a fire-place of the customary construction. The retort connects by means of a pipe with a condenser. This later ie a box made of hoiler iron, which is perforated hy numerous tubes like a tuhular boiler, or surface-condenser, in order to give the condenser a large cooling surface. The condenser is divided into numerous compartments hy partitions which have alteruate openings at top and hottom, one reaching from top nearly to hottom, and the next from hottom nearly to top.

At a suitable point in the pipe connecting the retort and condenser a steam hlast is introduced, which creates a vacuum or suction in the retort. In consequence of this suction the quicksilver fumes and air from the retort are rapidly drawn into the condenser. Here the quicksilver and steam from the steam blast, condensed in passiug up and down over and under the partitions and the air leaves the condenser through a pipe. This same pipe leads hack to the front or cover of the retort again; hence the same air which was originally in the retort and condenser keeps in constant circulation. The hase metals iu the amalgam, as soon as the retort gets red hot, absorb the oxygen of the air, and finally leave only a nitrogen atmosphere, hy which a possible oxidation of the quioksilver is prevented. The quicksilver and condensed water accumulate in the condenser, each one up to a certain level and then run out in a continuous stream through suitahle outlets which are provided.

The air-pump which carries the air from the condenser back to the retort is connected hy means of a T connection with another pipe. The object of this latter pipe is to equalize the pressure caused hy the expansion of the air inside of the retort at the heginning of the operation, and the falling off of quicksilver fumes in the retort at the end of the operation. The condsnser is surrounded hy a hox which is supplied with cold water, arranged so the cold water will circulate through the condenser tuhes, and the warm water run off.

The operation is as follows: The retort ie charged with amalgam and closed by the cover in the usual way; then the pipe connecting with the condenser is connected with the retort through an opening in the cover. The fire is started and as soon as the retort gets warm the steam hlast is turned on. As soon as the quicksilver commeuces to "run" the fire is kept very low, the distillation going on very rapidly. When the quicksilver runs light, the heat is increased. After the quicksilver ceases to run the steam blast is kept in operation for half an hour longer, in order to draw from the retort every trace of quicksilver fumes. The cover of the retort can then be removed without the slightest risk while the retort is still hot.

GLOWING accounts have been received for some time from Victoria, British Columhia, relative to the alleged richness of the mines on Lorne creek and the Skeena river, and now comes the statement that on Kilsam Kalem creek, ahout 40 miles from the mouth of the Skeena, diggings hav. been struck which prospect $4 to the pan.

Arizona and New Mexico.

Mines, Mills and Smelters.

[Notes from our Traveling Representative.]

THE Mimhres mill, near Georgetown, has started up.

HAGGIN & HURST ship their Victoria ores from Gague, N. M., to the Benson smelter.

THERE is a very quiet state of affairs in mining circles about Lake Valley and its honaoza mines.

THE Kelley mine, near Magdalena, N. M., is shipping all its ores to the Billiugs smelter, at Socorro.

THE Billings smelter at Socorro has heen running night and day since it hlew in, nearly two yeare ago.

THERE is a rumor that Chicago oapitalists have bought the Young Man mine at Malone, near Lordsburg.

MINING interests about Tucson are looking up somewhat, hut as yet are not pushing thiugs to their full capacity.

THE 30-ton smelter at Deming has been purchased hy partiee who intend buying and treating ores trihutary to that place.

SAILSBURY & WHITE'S emelter at Benson is only running one Water Jacket, improved pattern furnace. The capacity is 60 tons per day.

THE Tombstone Mine and Milling Company are not working a very large force of meu in their mines at present. Their mill at Charleston is runniog.

TEAMS that have been hauling coke from Wilcox to Globe for the smelters have been taken off. The copper company at Glohe has closed down for the present.

WORK on the Black Hawk mine in Grant county has been partially suspended. Ths closiog down of this property is a detriment to both husiness and mining interests of the district.

MINING men in Grant county are anxiously awaiting the completion of H. H. Carpenter reduction Works at Silver City. The succ.ss of these works will result in adding much to Grant county's output and lessening many dump piles now waiting a low-grade treatment.

THE Territorial Mining Company, at Dos Cabesos, are down 130 feet on a vein that shows six inches in width near the surface and eighteen inches at the hottom of ths shaft. The ore runs over $100 by sorting. Some talk of a mill in the near future is indulged in.

TOMBSTONE miners are now paid $3 per day. No difficulty is experienced in securing any numher of men at these wages. At present the supply exceeds the demand. Until work is further advanced and a few more companies start up miners in search of employment will do well to look elsewhere.

TOM EWING, of San Francisco, and Wilson Waddingham, of New York, visited Malone and Carlisle mining districts during the past week, their ohject heing to see and huy. As hoth are experienced mining men and represent a goodly amount of capital, there is a proha-hility that a sale or two may result from their visit.

THE Mammoth group, at Stanton, 60 miles from Tucson, in the Santa Catalina mountains are putting up a 30-stamp mill to be ready for work in 30 days. They will mill hy battery and plate amalgamation. Seventy-five men are now employed by this company. A numher of Michigan capitalists control the affairs of this property.

EASTERN men who fail to put up money to properly develop their mines and treat the output are making failures in every instance. Several mines in hoth Arizona and New Mexico have closed down recently on account of the timidity of investing stockholders, and trying to develop a mine with the expectation of dead work paying expenses.

COL. J. A. MUIR, superintendent of the S. P. R. R. at Tucson, has one of the finest collections of minerals in the South. The specimene embrace an extensive variety and are noticeable for their beauty and value. A glance at the cahinet of Col. Muir speaks volumes in behalf of hie popularity among mining men and his taste in the artistic display of so valuahle a collection. Thousands would not huy the cahinet, and when complete a more varied gathering of minerale cannot be found in any private cahinet on the Coast. Superintendent Muir is a Cali-

fornian, and his interest taken in mines and mining has pleased the many patrons of the Southern Pacific. All now lacking to complete the Colonel's collection is a cabinet in which to place this handsome lot of specimens. His many friends and admirers will no doubt supply this ere the gentleman is ready to use it.

RETURNS and shipments from the San Xavier district, 20 miles south of Tucson, are attracting attention. The ores are argentiferous galena and sand carbonates. Regular shipments to the Benson smelter have been made by a number of mines of late from this district. The San Xavier mine has over $100,000 of development work done. A recent strike exposed a large body of yellow carbonate ore running about $25 in silver and 42 per cent lead.

THE Grand Central mine at Tombstone is pushing the work of putting in the mammoth pump and expect to have it operating by July next. The cost of this improvement will be about $125,000. A raising capacity of 1,500,000 gallons per day is the work the pump will accomplish. The Grand Central is down 650 feet, with a three-compartment shaft. Water below the 600-foot level has stopped work until the big pump is in place. The ore output is 80 tons per day. The company's mill at Contention is running at full capacity. Over 200 men are employed by the Grand Central company.

DOS CABESOS mines are looking up prospectively, and the other way as to development and output. The Tornado Mining Company, of Cincinnati, Ohio, recently ordered a suspension of work on the mines and mill of the company. The ores are free-milling, but of a low grade, running from $8 to $20 per ton. They have a 10-stamp mill, battery and plate amalgamation. The erection of ten additional stamps is necessary to lessen the cost of treatment and enable the handling of the great body of low-grade ores profitable. It is feared that the Eastern management of the mine will not make the investment necessary to place the property on a paying basis. F. W. S.

Silver-Plated Amalgamating Plates.

For a number of years past, for saving gold in quartz and placer mining, the millmen on this Coast have preferred to use plates which have been prepared with a silver surface and very few plain copper plates are now used. As a consequence, the manufacture of silver-plated amalgamating plates has become quite an industry. Mr. Denniston, of the San Francisco Silver-Plating Works has filled not less than 3,000 orders for this kind of plate, and as showing how they accomplish the purpose he is enabled to give satisfactory references to all these purchasers.

The reputation of the establishment has been built up on the merits of the work produced. Full weight of silver has always been put on work of this description, and as they have all the latest and most improved methods for furnishing this class of work and skilled workmen to carry them out, the plates are known wherever any gold milling is carried on. They have been making these plates for the past seventeen years, and have sold them all over the Coast in every direction, and sent them to Alaska, Australia, Japan, Mexico and South America.

These plates have almost entirely displaced the old style, and give much better results. Labor in cleaning plates is saved and the quicksilver is enabled to perform its duty readily. In purchasing silver-plated amalgamating plates millmen should get good ones. It must be remembered that light silver plating looks as well as heavy, and therefore poor plates are sometimes sold by incompetent manufacturers, but they have no durability. Mr. Denniston prides himself in giving full weight of silver on all his plates, and as he has been in business here a great many years and still continues, his customers are evidently satisfied with his work. Full and complete instructions for handling these plates will be furnished on application. The largest plates of this kind ever made have been turned out at the San Francisco Plating Works, which is outfitted so as to make them of any desired size or form. Mr. Denniston has been awarded every first premium medal for silver plated amalgamating plates at the Mechanics' Institute Fairs for the last thirteen years.

The Calumet & Hecla mines, Lake Superior, produced last year 4,047,500 pounds of refined copper.

A Fifteen-Dollar Furnace.

Some time since W. Lawrence Austin, of Santa Barbara, Chihuahua, Mexico, read a paper on "Smelting Notes from Chihuahua," in which he briefly described a cupellation hearth commonly met with in the northern part of Mexico, called there *un caso*. Since writing the paper he has had occasion to construct a hearth of this description himself, using it, in conjunction with a water-jacket, for the reduction of a very refractory ore in the form of concentrates, and in a recent paper before the American Institute of Mining Engineers he qualifies some of the statements made in the paper referred to. At the same time, Mr. Austin presents some sketches which will enable any one to run up a similar furnace within three days, should occasion demand it.

As it is built entirely of common clay (the more refractory the better) and the ashes of scrub-oak taken from the ash-pit of the furnace itself, the materials necessary for its construction are available anywhere. Even the grate-bars of the fire-place are made of adobes cut in two. There are, scattered over the West, small deposits of refractory lead-silver ores, which, because of their rebellious nature or the isolation of the locality, do not admit of the ordinary smelting process and are not amenable to amalgamation or any other system of reduction commonly practiced; yet, with the help of litharge, or, in other words, by performing a crucible assay on a large scale, these ores can be readily and cheaply beneficiated, even where iron and coke are unattainable.

Mr. Austin says he is at the present time engaged in an operation of this description and is producing fine silver from a mixture of galena, pyrites and blende, using as fuel oak-charcoal, doing without the valuable fluxing ores attainable in most smelting camps, and depending wholy upon the litharge produced by the little adobe hearth about to be described. In doing this he is only imitating the common Mexican practice which has been in use for a century or more. Mr. Austin says:

In building the furnace which is the subject of the accompanying sketch I made use of labor and materials as follows, which gives cost of constructing one furnace:

300 adobes @ $ .01	$3.00
40 gals. clay, 80 gals. ashes, for test	—
One builder four days, at $1.20	4.80
Two helpers four days, at $ .60	4.80
Two boys four days, at $ .30	2.40
Total	$15.00

By comparison with my former figures these will be found somewhat in excess, a fact which arises from two causes. First, the inaccuracy of the statements upon which my calculations were based, and secondly the fact that the natives of Mexico, from one of whom I obtained the figures referred to, are, in their own country, always able to get work done more cheaply than a stranger can. This fact, by the way, it is well to bear in mind when forming estimates in that country, since the cheap operations of small proprietors often allure the inexperienced to commit grave errors of judgment. It will only be in rare instances that the profits of native proprietors can be augmented by handling large amounts of their ore with American machinery.

The Mexican is a good miner and a better metallurgist. It is well to examine closely the property he offers for sale, especially when it has a fine record and still cannot yield him sufficient for his simple wants.

But to return to our *caso*, the difference between the figures given above and those of my former paper is so slight as not to merit comment were it not for the lesson it conveys.

Lead ore, even when poor in silver, is very desirable in silver-lead smelting operations, and is sometimes paid for beyond its value. Again, the shipment of silver bars may, under certain conditions, be preferable to handling lead bullion. When a cupellation hearth can be put up, a cheap lead flux provided and the advantages of the former method of shipment tested without incurring serious expense, it might, in some cases, be worth a trial. The Mexican *caso* requires no expense for castings, no exhorbitant freight charges on the material for its construction, in fact it is simplicity itself, and answers very well for an experiment or where limited amounts of material are handled. In firing up care is necessary not to crack the test, but heat can be applied immediately after tamping in. Eighteen hours later the furnace is hot and ready for charging. Should the test be defective or worn out, chisel off the surface for six or eight inches, tamp it in again and the furnace is ready for firing. In putting in the the test the whole amount of material (clay four parts and ashes eight parts by measure), after being thoroughly mixed and dampened so as to retain the form of the hand when pressed, is thrown in together and tamped solid with wooden poles five feet long and three inches in diameter, sharpened at one end to a point one and one-fourth inches square. The reason for putting the whole amount of material in at once is that by this means the whole is beaten into a compact mass, whereas by tamping in a little at a time thin layers are formed, which easily peel off. After the whole is thoroughly pounded in the test is cut out with a piece of hoop-iron. The accompanying diagrams, exhibiting cross-sections and plan of the furnace, are self-explanatory. The adobes, or sun-dried bricks used, are 18x9x4 inches, excepting those forming the roof of the canal leading from the fire-place and covering the test, which are 26x11x3½ inches. Extra care is necessary in this preparation, and they are dried in the shade to avoid sun-cracks. The capacity of a furnace of this description is something over one ton of lead bullion in twenty-four hours, consuming less than half a cord of wood and requiring the attendance of four men, two on a shift, whose collective wages amount to about $2.80 per ton.

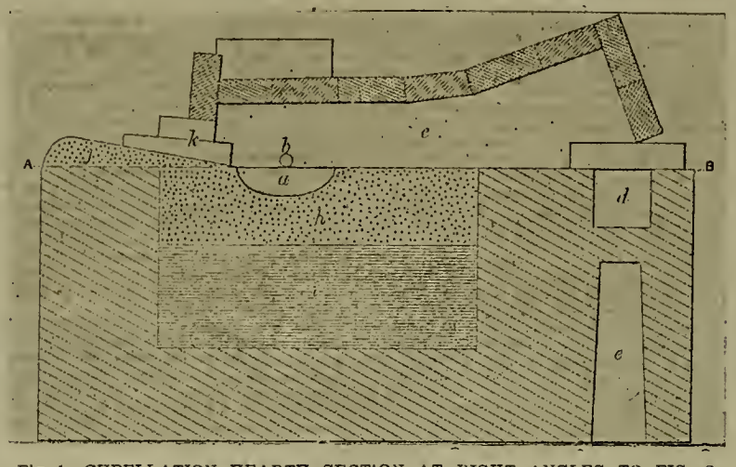

Fig. 1.—CUPELLATION HEARTH—SECTION AT RIGHT ANGLES TO FIG. 2.

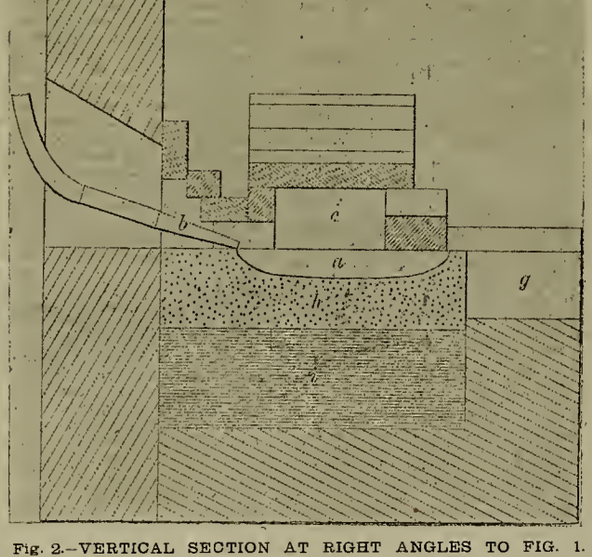

Fig. 2.—VERTICAL SECTION AT RIGHT ANGLES TO FIG. 1.

We have, therefore, in this apparatus, a $15-furnace, built in three days, capable of reducing one ton of bullion to almost pure silver in 24 hours, at a cost of $6.30 per ton. The operation of the furnace is very simple. The bullion is placed on the inclined hearth at *k*, where the flame passing over the molten metal strikes and gradually melts it down. Blast is not put on until the test, which holds 300 pounds of lead, is filled, when its strength is so gauged as to cause slight ripples to play over the surface of the bath. The litharge is drawn off as it accumulates into a basin outside the furnace, where it solidifies and is lifted off in cakes. It is noticeable that no stack exists, yet the flame shoots fiercely out over the metal whenever a stick of wood is laid in the fireplace. Repairs on the test, made necessary by the corroding properties of the litharge, are attended to when the silver is taken out. An old test pounded up finely and mixed with wood-ashes furnishes the material for making such repairs. The silver is allowed to cool gradually in the furnace, and, when solid, is removed, and the cake is thrown into water.

Electric Amalgam.

A short time since reference was made in the PRESS to an "electric amalgam," for use in the beneficiation of ores. The mercury was apparently charged with electricity in such a manner that, when used, it was kept in an active state and very "lively," which is a great advantage in amalgamating. This seemed like storage of electricity in mercury; but whatever it was, there is no doubt that a small piece of the prepared amalgam, dipped into a quantity of mercury, set the whole into a very active state, which could continue several hours.

Dr. J. H. Rae, who came to this Coast recently, while engaged in manufacturing the amalgam in this city, has discovered that he need not make a hard amalgam, but that he can prepare the mercury so as to answer the same purpose. By suitable manipulation and passing a current from a dynamo machine through it, the mercury becomes charged, and is able apparently to retain the current for some time.

A few pounds of this prepared mercury placed in a vessel and covered with brine was properly connected with a small electric bell, and there was energy enough in the mercury to keep the bell ringing constantly for 24 hours. Another portion was connected with a galvanometer, and even after 24 hours the needle would be deflected when both poles were connected. Dr. Rae is making the electric amalgam at the California Electric Works, 35 Market street, and will show the results to any one wishing to see them. Further experiments are being made, and when concluded we shall refer to the subject again. All who have used this amalgam have ordered second and third lots, which is the best sort of recommendation as to its efficiency.

New Reduction Works.

The Process at the Paradise Valley Mill.

Last November the Paradise Valley Mill and Mining Company's quartz-mill, on Martin creek, was burned to the ground. The Superintendent, J. V. McCurdy, who had, as if by magic, in a few months transformed the Paradise mine from an assessment to a dividend-paying mine, was in California at the time of the destruction of the mill. Being a practical and an experienced millman, he looked about to see if any improvement had been made in the method of reducing ore in the last quarter of a century. He became satisfied that there had, and he decided to erect concentrating works on the site of the burned mill. A representative of the Silver State recently visited the

New Reduction Works.

These works are situated on Martin creek, about seven miles from the town of Paradise and six and three-quarter miles from the company's mines at Spring City. The mill is erected on a steep hill-side, the main building being 40x100 feet in size, with two wings, one of which is an engine-room 38x40 and the other a drying kiln, 28x38. The ore is dumped from the wagons at the upper end of the mill and run through an 8x10 Blake rock-breaker, which reduces the hardest quartz to small pieces. It then passes between Cornish rolls, with 24-inch shells, which reduces the lumps of quartz to a smaller size and discharges into a hopper which supplies the pulverized ore to the three Huntington crushers, which are capable of reducing ten tons each per day. From the crushers the ore passes through Nos. 7 and 8 punched screens, or 45 wire mesh. From these crushers the ore is fed automatically to six Triumph concentrators of a capacity of five tons each per day, though where the ore is unusually heavy with sulphurets less than that quantity is concentrated. The quartz or gangue is carried by sluices to a tailings reservoir and the sulphurets are deposited in a bin, whence they are taken to a

Drying Kiln,

which consists of a revolving cylinder with six lifters. In the kiln the concentrations pass through screens, which prevents them from caking while drying. The kiln has a capacity of five tons per day, and it discharges into a hopper, from which the concentrations are drawn off into sacks for shipment.

The Motive Power.

The works are run by water-power, though a boiler and engine are being put in place in the building, to be used in the event of a scarcity of water or breakage of the water-wheel. The water is conveyed by a ditch about a mile in length from Martin creek to the mill. The dam is 70 feet long, 20 feet wide and faced with a four-foot wall of stone laid in cement. A short distance above the dam the water from two hot springs flows into the creek and raises the temperature of the water, so that no ice forms in the ditch or tail-race in the coldest weather. The power is furnished by a Leffel turbine wheel, 13¾ inches in diameter, with 51 feet head of water.

The Result.

Though some changes suggested by experience will be made in the new mill, the result so far is satisfactory and the success of the crushers and the concentrators is practically demonstrated. A crusher of 10 tons capacity, through a 40-mesh screen, requires no more power to run it than one and a half 900-pound stamps. The ore is worked up to an average of 80 per cent of its assayed value, while by the old amalgamating process it did not work over 60 per cent of its assayed value, and besides, the cost of reduction is greatly reduced. The pulp assays of the ore now being worked rangs from $40 to $60 per ton, and the tailings average about $11 per ton. The ore when concentrated assays about $650 per ton, and it is shipped to Salt Lake and sold. At present the works produce about 3,000 pounds of concentrations per day, and their capacity is to be increased by the addition of three more concentrators, and pans and settlers for working tailings, of which there are several thousand tons from the old mill on hand.

Other Matters.

The ore is hauled to the mill by ox-teams, which are found to be less expensive than horses. The company own nine quartz wagons and three sage-brush wagons. The wagons weigh from 4,000 to 7,100 pounds each, and carry from 12,000 to 24,000 pounds of ore. Every load arriving at the mill is weighed on Fairbank's scales, and at present there are 800 tons of $50 ore at the mill, besides some 700 tons of blanket washings, which average $70 per ton. Sage-brush is used in the drying kiln only as there is sufficient water-power to run the machinery. Near the mill are stables for the oxen, where everything is systematically arranged, and where, as at the mill, order prevails. Superintendent McCurdy and his family reside on the creek below the mill.—*Silver State.*

WHAT has become of the New River road project? Is it "teat?" It was understood that Col. Crossman would have a survey of one or more routes perfected before this date, but we cannot learn that anything has been done in that direction. If our citizens had not taken so active an interest in the matter we should be quiet. Perhaps the ground is too dry to make road now.—*Eureka Times-Telephone.*

Wood River.

A correspondent of the Virginia *Enterprise* says: Thinking that a description of this country would interest many who have an idea of locating in this neighborhood, I will endeavor to describe some of its good and bad points to the best of my ability.

Wood River contains four towns, situated within a radius of 12 miles; namely: Bellevue, Hailey, Ketchum and Bullion. Bellevue has a population of about 1,000 inhabitants. The principal industries are farming and mining. It is situated in a valley, and is a very pretty summer resort, the surrounding hills being all covered with grass four feet high, and is splendid for stock. The principal mines are the Queen of the Hills and the Minnie Moore, the Queen of the Hills employing about 70 men, and the Minnie Moore 40, and are good bullion producers. The ores extracted contain galena and silver. The Queen has a ledge containing seven feet of ore, and the Minnie four feet. The ore is put through a process of concentration called jigging, and then shipped to Salt Lake City for reduction, by rail.

Hailey is the county seat for Alturas county and contains about 1,200 inhabitants. It depends chiefly on the surrounding mines and farms for support. It contains many fine business houses and private dwellings, and is the central depot for the surrounding towns, mining camps and farmers. It is situated four miles from Bellevue and eight miles from Ketchum.

Ketchum contains a population of 1,000 inhabitants, and mining is the chief industry. The Parker is the principal mine and employs 70 men. There are a great number of prospects around Ketchum and some of them are doing well. Bullion is situated seven miles from Hailey and contains a population of about 400. There is quite a number of bullion-producing mines around Bullion. The principal ones are the Bullion, Ophir, Mayflower, Idaboan and Jay Gould, and I have no doubt but what this will be a big camp some day in the near future. There are a great many old Comstockers in this country, and they all seem to be doing well, but if they should turn out a bonanza on the Comstock it is more than probable that they would turn their faces that way again. It is quite dull here at present, but things are beginning to look better, but I would not advise any one to come here to look for work for a while, as the mines are full-handed and there are many idle men to be seen on the streets.

The Wood River Branch Railroad connects with the Oregon Short Line at Shoshone, and brings many emigrants to this country. They make a trip daily to Ketchum and return, and judging from the number of freight cars they are doing a good business. There is plenty of timber within a few miles of here, and lumber sells at $15 per thousand. Staple articles are also cheap. Potatoes one and a half cents per pound, flour $3 per 100 pounds, and everything in proportion.

Look Out for the Mining Interests First.

In the following letter to the editor of the Helena (Montana) *Independent*, a correspondent offers a suggestion which is applicable in other places as well: Of late I have seen several articles in the *Herald* in reference to paving our streets, the probable cost of it, etc. While a paved street might be a nice thing to have, we are inclined to think it is a little ahead of the times. My idea is that if the city can raise money enough for paving purposes, that they had much better take the money and take steps toward building a smelter or reduction works, something that is much more needed at present than paving our streets.

If we don't begin very soon to look more to our mining interests and less to something that can very well be gotten along without, what will become of us? Let your mining interests go? What use will a paved street be, unless it would be to keep the grass from growing in our streets. A smelter or reduction works in the vicinity of Helena would be a big thing. It would scatter many a dollar among us that a street pavement wouldn't. Just think of it, the amount of business there would be for a smelter or reduction works. There is the Ten Mile district alone would make it pay besides the new Helena district, Scratch Gravel, Mt. Helena, Last Chance, Stemple and a large number of other important districts. Why, one smelter or works couldn't begin to do the business.

The *Herald* is too much for style and not enough for good solid industry, something that is needed in any mining country. Now do let up on the pavement racket and give us something that will tend more to building up our city. After we have smelters, etc., then there will be plenty of time, and our citizens will be by far more able to build your pavements. The mines are what want looking after now.

DIANA MILL.—Jack Millner has been running the old Diana mill at Benton for the past three weeks, and is not yet through. We are told that the ore works up to about $1,000 a ton; also, that by means of suitable slum-pumps, all the water and slums carrying minerals in solution are pumped back for further manipulation, so that scarcely anything of value is lost.—*Inyo Register.*

On the Formation of Coal.

A correspondent of the *Coal Trade Journal* says: Among the coal-producing sections of Pennsylvania we find the strata of coal horizontal in sections west of the Allegheny mountains, and eminent geologists have pointed out that they were the most Bituminous; as we travel to the south-eastward, however, these same seams became progressively debituminized in proportion as the rocks become more bent and distorted.

Right here is where there seems to be a slight divergence from the rules governing the two sciences of chemistry and geology, for at first on the Ohio river the proportion—as determined by actual tests—of hydrogen, oxygen, and other volatile matters represented in these coals, ranges from 40 to 50 per cent, while eastward of this line, on the Monongahela, for instance, it still approaches 40 per cent, but careful measurements prove conclusively that the strata begins to experience some gentle flexures. Again on entering the Allegheny mountains, where the distinct and marked anticlinal axes begin to manifest themselves, but before these dislocations are very marked and apparent, the volatile matter is generally in the proportion of from 18 to 20½ per cent, so the teachings of advanced geology are not so inconsistent with those of modern chemistry as first appearances would indicate. So when we arrive at some insulated coal field, associated with some of the boldest flexures of the Appalachian chain, where the strata has been actually turned over, as it is near Pottsville, we find the coal to contain only six per cent of these volatile matters, consequently is entitled to being classified as Anthracits.

Thus, some gigantic upheaval, constantly appearing wherever valuable deposits are found, leaves us sadly at sea when we attempt to prove the presence or absence of matter by the principles we have been taught to recognize as responsible for the same, when in reality some force or combined forces of nature have transposed this entire strata of entire sections, perhaps entire continents.

As we examine closely into all coal deposits we find bands and nodules of what is called clay-ironstone, formed of carbonats of iron mingled with earthy matters resembling that which constitutes shale, this union seems to be purely a mechanical one, and what are termed chemical combinations and affinities have acted no part in their formation. Mr. Hunt instituted a series of experiments for the purpose of fully illustrating the production of this substance, and claimed that decomposing vegetable matter, such as would naturally be distributed through all coal strata, prevented the further oxidation of the proto-salts of iron and converted other peroxide into protoxide by taking a portion of its oxygen to form carbonic acid, such carbonic acid meeting with the protoxide of iron in solution, would unite with it and form a carbonate of iron; and this mingling with fine mud, when the excess of carbonic acid was removed, might form beds or nodules of this argillaceous ironstone; though this theory was not received by practical geologists generally when Dr. Hunt first advanced his views, it is now pretty generally admitted as the correct one.

Again we have found in the coal deposits of all sections of both America and Europe, wherever we have conducted experiments, the association of fresh brackish water and marine strata with coal seams of terrestrial origin, this is of quite frequent occurrence here. Thus some deposits in Pennsylvania, in all probability formed in brackish water, have often been described in the technical journals, and are generally the youngest members of the coal measures of any district, and at a point where they are in contact with the Permian group. It generally consists of shale and sandstone of variable thickness, with coal and traces of plants, including a bed of limestone from two to twenty feet in thickness, which is cellular, and resembles the lacustrine limestone of France and Germany. One place in Alabama it has been traced for miles, and can be easily recognized at points far distant even in the partially developed coal fields of Indiana.

THE MINER.—Hon. M. J. Farrell, of Austin, has been contributing a series of interesting papers to the *Enterprise* upon the silver question, and at their conclusion offers the following panegyric to the miner: He is a pioneer of the world. He braves all risks and dangers and opens up the wilderness for the more timid. He occupies the waste places of the earth, which but for him would never benefit mankind. He endures hardships, dangers and privations, and after wearing out his life for the benefit of mankind generally dies poor. Unlike that of the farmer and manufacturer, his contribution to the world is practically imperishable, and the dollar that comes from his hand is not that transferred from one to another of the money already existing, but is a dollar wrested from the bowels of the earth and added to the world's treasure. He sends forth from the barren fastnesses of nature a stream of wealth that flows through all the channels of trade and commerce, imparting life and vigor to the business of the world, and giving bread to earth's toilers to its remotest confines.

Owing to the fame as an ore-producer of the Copper Queen, of Arizona, the name has become a favorite and many new "Copper Queens" have resulted.

The "Overland Monthly."

This favorite magazine, the only one of the kind published on the Pacific Coast, continues to improve and furnish its readers with a varied literary feast each month. The table of contents of the May number is as follows: "Rambles in the Rockies," by Edwards Roberts; "Mrs. Jones and her Old Man," M. A. Ross; "Bergamo," W. Winthrop; "The Priest's Tale," Lonise P. Heaven; "A Ramble in the Foothills," Dagmar Mariager; "Little Jethro," Sara D. Halsted; "Riverside London," Samuel J. Rea; "Barbara's Story," Katharine Royce; "In Memoriam," L. P. H.; "The Capture of Porto Prayo," W. H. P.; "Deaf-Mutes and Their Education," Douglas Tilden; "The Gold-handled Riding-whip," Alhin Putzker; "To a Young Man," E. L. Huggins; "The Essential Principle of Poetic Art," G. H. Howison; "Ballad of the North Wind," Alfred A. Wheeler; "Prehistoric America," "The Religious Aspect of Philosophy," Basnett's "Theory of the Sun," "Recent Biographies," "Etc.," and "Book Reviews."

In the "Etc.," in speaking of "Pacific literature," occurs the following paragraph:

But how about the special function of a Pacific magazine? As a Pacific writer should simply seek the best excellence of which he is capable, without worrying about being intensely Pacific, should the magazine seek the best excellence attainable, without reference to local quality? If it were the only medium of current literature to the readers of its Coast, yes. To do otherwise would be as absurd as to limit our public libraries to local subjects or the work of local authors. But the best work of Eastern writers comes abundantly to our community through other sources; the study of Eastern subjects is amply provided for otherwise. In its marked discrimination in favor of Pacific writers and Pacific subjects, therefore, the magazine accepts not so much the provincial position of a local paper, as a specialized function, something as a journal of science, or art, or history, or criticism does. If in some not impossible far future it should hold a *commanding* position in American literature, it should undoubtedly become cosmopolitan in its aims, taking all Anglo Saxondom for its province; but meanwhile it can never be to advantage to a journal to spend much effort in occupying any field it cannot command.

ENCOURAGE THE PROSPECTOR.—When prospectors from other portions of the State come into this county for the purpose of exploring and developing our mines they should not be annoyed by demands for poll and road taxes. It is fair to presume that these men pay such taxes in the counties where they reside, and that they are only temporarily among us. When a petty official with a view of making his percentage harasses them and threatens to seize their baggage and prospecting outfits for taxes, a natural prejudice will be aroused in the bosoms of the hardy miners, and they will give our mining field a wide berth. Even if they do not pay poll-taxes in other places, Shasta county can afford to lose the few dollars demanded of them. The prospector, though poor and sometimes ragged, is the forerunner of capital and enterprise. By his efforts new mines and sources of wealth are discovered and brought to the notice of men of means. Capital follows him and prosperity and a demand for labor ensue. Take the history of the last three months as an illustration of the benefits arising from the labors of the prospectors; see the number of men brought into the county and the thousands of dollars that have been expended for supplies, and what we have seen so far is only a fraction of what we will see in the future. By all means the prospector should have a chance, and nothing should be thrown in his way to hinder or discourage him. He is working not alone for himself, but for all of us, and through his efforts the county will grow rich and prosperous. —*Shasta Democrat.*

THE ALBION MINES.—The new mines near Albion, in Cassia county, Idaho, are coming to the front. The district is located four miles north-east of the little town of Albion, and about 200 locations have thus far been made. The first claim located, known as the Albion lode, and owned by Lucas & Wells, was struck late in the fall of 1884. No development was made during the fall and winter, but recent developments show it to be a well-defined lead, 14 feet wide, and traceable on the surface for about one mile. Assays from this claim run from 50 to 400 ounces in silver to the ton, with a small percentage of lead and a trace of gold, the average being, however, about 100 ounces and 14 per cent lead. The climate and altitude of this camp are such as will enable prospectors and miners to continue their operations the year through.

PROSPECTING.—Ben Bowen, the Buckskin Ranger, an old prospector well known here, returned last week from a prospecting trip to the Henry mountains. He has been out there the greater part of the time for three years past. He brought in some samples of very fine rock, which he claims to have taken from discoveries made by him while out there. He has had some assays made here which show a high percentage of silver. He says that his claims lie about sixty miles south of the White Canyon country, over which there has been wild excitement of late.—*Southern Utah Times.*

Bnilding Materials.

Building materials in the rough and their preparation coustitutes oue of the most important and growing branches of trade on tho Pacific Coast. First, we have the lumber product which, including the Puget Sound supply, is probably the most extensive on the continent, to say nothing of tho vaet unexplored timber tracts of Alaska.

Our northern neighbor, British Columbia, has a vast forestry of lumber, which is already being utilized to somo considerable extent, especially in the neighborhood of Burrard Inlet, where many cargoes are annually furnished for exportation.

During the past few years English capitalists have been largely attracted to points on the Pacific Coast other than those of British Columbia, in pursuit of valuable timber lands. They have also succeeded in securing some considerable investments—notable among which is the California Redwood Company. This incorporation, which ie composed chiefly of British capitaliets, has secured many thousands of acres of redwood timber land iu Mendocino county, and in furtherance of their business plans, have erected wharves, etc., at Port Costa for storing their lumber preparatory to its shipment to England. They have already exported some ten or more cargoes of redwood lumber to Europe, and this branch of their business promises to be of steady growth.

Many American lumber companies are also largely engaged in exporting. While exports of lumber have been quite active during the past year, at the same time shipments of doors, windows, mouldings, etc., to the Australian colonies havo been large; while De Lesseps' Panama Canal has been and still is a large purchaser of lumber. New York drawe upon us for redwood shingles, while one or two cargoes of ship spars and redwood lumber have also been sent to the Atlantic States upon orders. Chile has also taken several cargoes. Low coasting lumber freights have been the rule during the year, and this of itself has been an inducement to outsiders to ship lumber to market, and in some cases they have heeu forced to sell their cargoes at a trifle more than enough to pay for freight and charges.

Business At and About Seattle.

The Seattle Lumher and Commercial Company, according to a local paper—the *Post Intelligence*?—furnishes employment for ahout 80 men, and is engaged in the manufacture of rough and dressed lumher, sash, door, lath and shelving. During the year they have made a great deal of trimmings for churchee around the Sound and vicinity. The cspacity of the mill is estimated at 50,000 feet per day.

The Stetson and Post mammoth mill employs 90 hands, and turns out a vast amount of material. The estimate of material made daily is as follows: 65,000 feet rough lumber, 25,000 laths, 100 doors and 100 windows. They have added new machinery and have improved their mill generally since 1883. One noticeahle improvement is the introduction of the steam feed, by which the carriage is driven to and fro. The Seattle Mill Company employs 20 hands and manufactures sash, doors and all kinds of rough and dressed lumber. The capacity of the mill ie ahout 30,000 feet. The Western Mill Company employs ahout 20 hands and makee all kinds of lumher, sash, door, etc. The Michigan Mill Company employs 15 men and makes rough and dressed lumher. Yesler Mill employs 65 men. This mill suppliee a great deal of the Puget Sound trade. It has a capacity of 30,000 feet per day. There have been several new machines added during the year. The Oregon Improvement Company's mill employs 22 men and makes sash, doors, etc., hesides the rough and dressed lumber used in constructing the company's improvements. There has heen added to the mill during the ycar a 50-foot hed planer.

The O. I. Company's new mill stands uncompleted, with much of the fine new machinery scattered on the floor. It has cost the company ahout $22,000 already, and unless the Puget Sound Shore Line finds a need for the site of the old mill, the new one will remain in its uncompleted condition. The Occidental mill stands all ready to hegin operations, but the property heing in litigation, the owners will undouhtedly be compelled to allow it to remain in idleness.

TONS OF GOLD COIN.—At the last session of Congress an appropriation of $100,000 was made for transporting a portion of the money in the vaults of the United States Sub-Treasury, in San Francisco, to the Treasury at Washington. Though no official notification of the time of removing the coin has heen puhliehed, it is helieved that the transfer will be made ehortly. The *Alta California* saye there will he on hand by the end of the present month at least $90,000,000, and if necessary all hut $5,000,000 can he withdrawn. Of this largc sum $50,000,000 is in gold coin. It weighs 83 tons and will require 8 cars to carry it. The heavy coet of transporting hy exprese companies arises from the fact that they have to give honds for safe keeping, and are ohliged to keep extra guards over it during the entire passage.

The Richmond mine and furnaces at Eureka have started up again, putting about 150 men at work. A gang of non-union men, at reduced wagee, is working in the mine.

USEFUL INFORMATION.

Painted Floors.

That carpeted floors aro harborers of disease is a queetion which, to thoso who have heen placed in position to fully investigate, has but one side; and since some of our leading jouruals have called to mind long arrays of unquestionablo authorities proving that carpets, however clean and free of dust apparently, give off at every step or movemcut infinitesimal germs of lung irritants, the pcoplo seem to have indorsed the theory, and in many a fine house carpets have given place to Eastern rugs which, occupying a central position, leave a fino opportunity for the paintcr to display his taste iu decorating the intervening space betwecu the rug and wainscoting. It will, however, place the work aud imperfections of the carpenter more prominently before the people, inasmuch as the floor, being constantly exposed, must he made smoother and of better lumber than often finde ite way into the floors of our houses, for when the floors were entirely covered with carpets, damp, unseasoned lumher or timber or the same affected with dry rot, could he used, and the occupants ho little the wiscr for the deception; but now the floors must he of good lumher and nicely fitted, else the painter, whose work supercedes that of the carpet-layer, will not accept the floor as the carpenter left it, for his work being on top, he will be held responsihle for its appearance forever afterward.

If this change in fsshion hrings ahout this revolution in floor-making, the change will have another argument in its favor; for others, as well as we, have seen damp, unseasoned lumber put in floore, which in turn were laid upon the joists of the same or even worse quality, and then a carpet covered over all. The poor inmates were thus compelled to hreathe the moisture of seasoning lumher after it was filtered through a carpet, which tended to render it still more unhealthy; and hence we are of the opinion that carpets are respousihle for far less disease than charged with; nevertheless, we are decidedly in favor of the rug system of covering floors, for the reason that it is much more economical. It is hygienically and otherwise a very wise plan, hesides the facility of often removing and thoroughly shaking the rugs, without employing a lot of workmen to take up, and heat and put down again. It looks as though carpets, like the Chinese of the Pacific Slope, "must go."—*The Manufacturer and Builder.*

CONCRETE WALKS.—An engineer tells how to make a cement or concrete walk requiring no great skill in preparing materials. These are water, lime aud gravel or ashes, or both. The gravel and ashes are put in a heap and wetted. One harrel of the waterlime is mixed with sharp, clean sand, dry, heing shoveled over hack and forth several times to get a thorough mixture. A portion is then mixed with water into a thin, soft mortar, and five parts of the wet gravel or ashes are well mixed with it, so that every fragment is coated with the comhining mortar. This is important for ohvious reasons. The concrete is spread on the graded walk and heaten down with a rammer until the moisture gathers on the surface; some of the dry sand or cement is then scattered over the surface to absorh the moisture, and the surface is smoothed over with a plank ruhher having a sloping handle to work it back and forth. In a few days this is hard, aud it becomes harder with time. By making divisions of thin strips of wood or tarred paper the cement may he laid down in blocks, squares or diamond-shaped, and for extra good walks the blocks may be colored hy mixing the finishing coat with brown or gray, or other colors, alternately.

LONG-TIME SECURITIES.—It is very common among railroad corporations to have leases executed for such a long term of yeare that perpetuity is practically secured. So accustomed have railroad managers thus hecome to the fixing of very long periods for their operations that it is not surprising to notice a tendency toward the greater extension of the limits in which their honded indehtedness will become due. The longest period of this kind which has yet come under our notice is the one proposed last week at a meeting of the stockholders of the Pittsburgh, Fort Wayne and Chicago Railway Company. It is proposed to issuc honds to he due at the option of the company after the year 2868, or only a little matter of 984 years hence. The time is coming—if, indeed, it has not already come—when bonds of this kind, repreeenting undouhted value, will he in very good demand by investors in thie country who desire to put their money where it will not he dieturhed every few yeare hy their securities heing paid off, caueing them much trouhle in seeking other investments.

PLACARD BENISONS.—We eometimee eee at the doorstep of some house the word "welcome" imhedded in the rock or ou a foot-mat. It ie pleasant to he so cordially and promptly invited within, but we must divide this gushing hospitality with the merest wayfarer, the peddler and the tramp. If it were thrown down just once and for us only, what a different train of thought it would suggest! But a hospitality eo hroad overlaps itself and losee its suhtle and most cherished fragrance, for the truth is, neither love, friendship nor religion can he profited hy tricks or rude puhlicity. Their graces and henedictions, their benisons and henefits, come with silence and secrecy.

THE ELECTRIC LIGHT AND GAS.—When the electric light was introduced the city of Boston was paying $2 per 1,000 feet for gas, and private consumers were paying $2.80. Now the city pays $1.30 snd private consumers $1.80. Boston has been a liberal patron of the electric light. Its streeta havo probably been lighted more hrilliantly for tho past two or three yeare than those of any other largo city. And the police department of Boston has borne testimony to the value of this extra lighting as tending to prevent crimo. But the gae has not hecu entirely crowded out of the streets, aud it is now proposed to light the city again with gss, on tho ground of its being more economical.

SOLDERS FOR ALUMINUM.—Aluminum may bo soldered by means of solders of tin and zinc, or of tin, bismuth and aluminum. Those of tin and aluminum are to be preferred. According to the working that the soldered piecce have to undergo the solders must have different compositions. If the metal is to be molded an alloy of 45 parts of tin and 10 parts of aluminum should he used, which is malleable enough to withstand the hammering. Pieces that are not to he further worked are easily soldered with an alloy of tin and a less quantity of aluminum. The process is the same as in soldering tin plate or it can be effected still hetter with the flame.

MAKING BUTTER BY ELECTRICITY.—A patent has heen taken out in France hy M. Tichenor for a process of butter-making hy electrieity. It is stated that, the milk being placed in a vessel of special form, a pair of electrodes is introduced and connected to a dynamo capahle of yielding a current of 40 volts, when in from three to five minutes the hutter accumulates at one end of the poles in the form of little halls. The claims incinde the removal of rancidity from hutter, and the manufacture of cheese, by the help of the current.

COFFEE-COLORED CURTAINS.—The easiest and most satisfactory way to dye them is, after washing, to use yellow ocher powder. A small quantity does for one pair of curtains, mixed firet with a little water, and then diluted according to the depth of ehade wanted. They shonld not be wrung, but just well pressed between the hands and carefully hung up to dry, and then mangled when thoroughly dry. By this process one procures a rich coffee tint, without anything disagreeahle.

SUGAR FROM CORN STALKS.—The helief of some persons that sugar in paying quantities can he got from corn stalks, as well as from sorghum, recalls the fact that the State of Connecticut gave to Edward Hinman a patent for making molasses from corn stalks, in October, 1717, or nearly 167 yeare ago.

TO MAKE A GLUE THAT WILL NOT BE AFFECTED BY MOISTURE.—Take of good common glue 2½ lhs., resin 2 lbs., and red ocher 1 lh., with a very little water. Glue melted in skimmed milk is also recommended—1 lb. of glue to 2 quarts of milk.

A BAVARIAN chemist is reported to have invented an enameling liquid which renders any species of stone or cement harder than granite, and gives it the indelihle appearance of any mineral that may he desired.

WIDOW PENSIONERS.—Twenty-one thousand widows of soldiers of the war of 1812 are stated to he still drawing pensions from the Government.

GETTING PARTICULAR.—Leeds, England, has a "society for the suppression of noisy trades in residential localities."

SILK to the value of $17,000,000 is produced annually hy the 60,000 people employed in that industry in Switzerland.

GOOD HEALTH.

The Babyhood of Cocaine.

I. Claihorne, Jr., writes to the *Herald of Health* as follows:

Since the invention of vaccination and the discovery of general anæsthesia as a consequence of the inhalation of chloroform and ether, no more wonderful and eimple secret hae been filched from nature'e healing stores than that revealed through the recent discovery of the local anæsthetic, cocaine. The discoverer, in the course of chemical experiments, accidentally noticed that an application of a two per cent solution of the muriate of cocaine to the eye rendered it ineensihle to contact with the finger. He was quick to realize the scientific importance of his discovery, which has eince heen fully established hy numherless experiments hoth in Europe and in thie country.

Cocaine is an alkaloid belonging to the same class of chemicale ae quinine, strychnine and atropine. It is ohtained from a small tree six or eight feet in hight, the leaves of which, when green, are said to resemhle those of the tea plant. It grows wild and is aleo cultivated in South America, chiefly in Peru and Bolivia. Its wonderfully stimulating properties had been recognized by the natives long before medical men had any knowledge of them. By chewing the leaves together with a little vegetahle ashes containing some alkali, the natives of these countriee are enabled to bear with ease the toils of long journeys in the heat of a tropical summer. In such high esteem was it held among these people that they called it the "Divine Plant." Its leaves, made into amulets, were secreted about the persons of the young and old as a talisman against evil spirits and disease. In 1569 the first medical treatise upon the plaut was written by a physician of Seville, and in 1749 it was first brought to Europe. Siuce the latter date it has steadily found favor with the scientific world, until in the fall of 1884 ecientific research culminated in discovering its anaesthetic properties when applied locally upon any of the mucons membranes of the human body. As the alkaloid itself, cocaine, is not freely soluhle in weter, its soluble salt, tho muriste of cocaine, has heen used, and is found to possess all the properties of the alkaloid.

The local anæsthetic effect of the drug has proved itself of incalculable value in enabling surgeons to perform the most delicate and otherwise torturing operations on the eye without infliction of pain. All the operations performed upon the eye, save those upon the lids, can now he done painlessly, without the neccssity of the patient's undergoing the general insensibility produced hy ether or chloroform.

The Safest Part of a Car.

It was well said by the conductor, who, when asked what was the safest part of a car, replied, "That part which happene to be in the shop at the time of the accident." It is a popular superstition that the center of the car is not only the safest part, but is also much the easiest riding. One of the greatest trials of a Pullman conductor's life is the fact that ahout every passenger aske for a lower center herth the first thing, and is frequently indignant becausc it caunot he had. If the center of a car rides any easier than the end, then our cars, huilt as solid and as strong as they are, spring up and down in the middle precisely as does a huckhoard. If they do not, why should it rise any easier? As for safetv, if you are in the rear of the last car on the train, and another train runs into the rear, you are liahle to get hurt. In all other accidente you can conjure up as liable to occur, it is the safest. If a head collision, there is nothing hack of you to add force to the hlow. If the car leaves the track and collides with a bridge or any ohstruction on a side track, it will not he in your end. If the train is thrown down an embankment there is nothing to land on top of you. Then, this location is the most pleasant. From it you can watch all the movements of your fellow passengers, often a good way of passing the hours of a long aud tedious journey. If your eye happens to catch a particularly fine view, you can, hy turning in your seat, or stepping to the door, take it all in. If there is a safest part of a train, it is in the last seat in the lsst car.

OVERWORK.—"To have as much work to do as one can do, and a little more," has been given as the hest recipe for cheerfulness and contentment; hut while readily concurring in the first part of the sentiment, we cannot hut suggest that it may be, perchance, that very "little more" which is at the root of half the ill-health, pale faces and fractious nerves of the present day. It is that last drop in the already full cup, that last straw on the already well-laden hack, which is too much—just one degree too much for the sorely-pressed men and women, who are fighting in the fight of life, and it is that overplus from which they ought if they can to ahstain. They will not see it; they will not do it. Each allows that in the case of another that other's duty in the matter is plain enough; hut for him or herself—and then follow excuses, arguments and ohstinacy not to he shaken. Everyhody, it would seem, must attempt something over and ahove what he or she can possihly accomplish; everyhody must drain a little more out of their worrying, feverish hrains, than can be yielded consistently with only wholesale effort and energy; everyhody must fly at game heyond their reach, if only it he within their sight.

A NEWARK, New Jersey lady has recently ohtained lettere patent for a spoon that may he used by iuvalids and children without spilling its contents. The improvement consists of an attachment to the cdge of the larger portion of the bowl of an ordinary spoon, and is highest opposite the handle and tapered each way toward the end of the spoon. The lip may he made outwardly similar in form to a section of an inverted spoon-howl. This spoon will prove of great convenience for those who have the care of children or pereons that are eick.

TO EXTRACT CITRIC ACID FROM LEMONS.—The juice of lemone is allowed to ferment, the chalk added to form calcium citrate. This salt when treated with sulphuric acid decompoeee, giving rise to calcium sulphate, a white insoluble powder and citric acid, which is in eolution. The latter ie then evaporated and the citric acid purified hy crystallization. It is in good demand and regularly sold by wholesale drug houses.

IMPURE MILK.—Of eeventy-five milk dealers, the contents of whose carts were inspected a few days eince in Brooklyn hy the Inspector, nearly all were found to contain large quantities of water, and eeven were disposing of impure milk.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

MILL.—Amador *Sentinel*, May 6: Work on the Shugert & Morgan mill in Hunt's gulch is being pushed as rapidly as possible. Considerable grading has been done on a point just below the tunnel, and here the work is in progress. The management decided to grade for a 40-stamp mill, but at present will only erect 20 and a building to cover the same. A large ore bin on the slope of the hill is about completed. The mortar blocks are up, and all the timbers belonging to the mill proper are on the ground, mortised and fitted for position. The mortar blocks and heavy framework are of Oregon pine, coming by way of San Francisco. The intention is to make the mill as complete as possible in point of compacity, and to this end self-feeders and improved concentrators will be put in, all the machinery to be run by water-power. A pipe to the ditch on Murphy's ridge will give about 450 feet pressure. We learned it was the intention to open up the Amador Queen near by and make that claim the real producer of ore, but likely running on quartz from the Murphy's gulch side. The claim will be run by machinery geared to a water-wheel. When the Amador Queen shaft was sunk several years ago, plenty of ore was shown up that prospected well. All ore raised can be run across a trestle to the mill, only a short distance. From present indications the mill will probably commence crushing ore during the summer months, starting on two quartz piles that are expected to pay handsomely.

HEAVY SALE OF MINING PROPERTY.—W. A. Nevills got back from the city on Sunday evening. As far as we can learn, he has sold to parties in Chicago one-half interest in all mining property in this section, embracing the Mammoth mines, Big Tunnel, Moore mine and Little Ranch. We have it on good authority that the price was $400,000; $250,000 cash, balance conditional in one year. Mr. Nevills still retains one-fourth interest in all the property. Senator S. P. Jones holds one-fourth, and the Chicago capitalists one-half. Work at the Big tunnel and also at the Mammoth mine and mill is proceeding as usual, under the management of Mr. Nevills. The appearance of a clerk is the only change at present.

GOVER.—Amador *Ledger*, May 9: Important discoveries have been made in this mine, near New Chicago, which encourage the stockholders to believe that a return of the days of dividends is not far off. In running a drift west, at a depth of 450 feet from the surface, a large body of quartz has been struck. The width of ledge we have not heard. The ore is said to be of paying grade, and futhurmore it is confidently claimed that it extends clear to the surface. The mill has been started to its full capacity of 20 stamps. A large force of men has been put to work, and everything betokens a long and successful career of activity for the mine. New Chicago is already feeling the stimulus of this new life; it now boasts of three boarding-houses.

MISCELLANEOUS.—The St. Julian claim at Middle Bar made a division of the proceeds during the past week, between the owners and lessees. The terms of the lease provide that the net proceeds, after paying all expenses, shall be divided equally between the contracting parties. The first division under this agreement was made last Tuesday. We understand that a snug little sum was divided among the owners, who are entirely satisfied with the results so far.

MAHONEY.—Amador *Dispatch*, May 9: We learn that arrangements have been made for starting up the Mahoney mine at Sutter Creek, in a short time, on a grand and substantial scale. The company now having control of the mine have an unlimited amount of capital and will be able to go ahead with the work without any financial drawbacks. Morris Brinn has been installed as general superintendent, and Humphrey Reese as underground foreman.

SUTTER CREEK.—Cor. Amador *Ledger*, May 9; The Iowa mill was started a few days ago. The mine is still yielding ore of high grade. Mr. Stewart is still running 20 stamps of the Lincoln mill, on the dump pile. At the McIntyre mine, the developments continue to be of a promising character. The Amador Sulphuret works are expected to resume operations in a few days.

SOUTH SPRING HILL.—The contract has been le for sinking the shaft 200 feet deeper. The price we are told is $8.50 per foot. The new hoisting works are running smoothly, and the mill is kept steadily at work.

Del Norte.

HANES FLAT.—Del Norte *Record*, May 6: Messrs. Yates and Morse, interested in the Hanes Flat mine in this county, went below on last steamer, and we are informed that their business there is to purchase the machinery for a little saw-mill to be erected on Coon creek. It is the intention to add the water from this creek to their former supply and bring the water to their claim by means of flume, thereby increasing the supply and obviating much expense in the way of repairing that from time to time becomes necessary.

Inyo.

THE MAXIM.—Inyo Co. *Register*, May 7: Wm. Stansfield, of the Maxim propeity on the river near old Cbrysopolis, has completed the work of putting in place and operation two new concentrators. A great deal of excavating was necessary to place them in correspondence with the tanks and tailings reservoir. The machines are the Duncan patent of 1883, entirely new to this part of the country. They are constructed wholly of iron, in general appearance, much like the well-known Hendy machine. The revolving tables have a peculiar oscillating motion which throws the water down through the center, while the heavier sulphurets fall into a lower rim from which they are discharged into tanks. Those best informed think that their great practical success will come when the mill gets to running on the vast quantities of low-grade gold ores with which the district so abounds. The mill will probably commence running day and night during the present week.

GAVILAN.—*Independent*, May 9: A crushing of 18 tons of ore from the Gavilan mine was made some days ago at the arastra at Hunter's canyon. This is the ledge belonging to Cohn & Straus that was discovered last fall. This ore yielded $43 per ton. The cost of mining was $4 per ton; packing the ore to the arastra, $6 per ton; crushings $10 per ton; total cost, $20 per ton, leaving a margin of $23 per ton. The ledge is four and a half to five feet wide, and stands up in the side of a deep canyon, exposing a large amount of ore.

COLUMBIA MINE.—The Columbia is one of the most promising mines of the Darwin district. Frank Silva is getting out ore the best of which will go 120 ounces per ton in silver and 70 per cent lead; this he is sorting for shipment. There is much ore in this mine that will go from 35 to 40 ounces in silver. The last shipment of bullion made by J. C. Eddy from Snow's canyon was of the value of $2,641. The bullion was of silver, 987 fine, and contained $72 in gold. Two or three times each month Mr. Eddy ships small lots of gold ranging from 12 to 30 ounces. Most of this comes from Old Coso district. Other parties at Darwin ship about as much more. Last Monday Billy Hedge brought down some samples of ore from the mine owned by himself, Dick Eldred and Dan Crough. The vein is found over the whole of their claim, and also over the claim of Welch and Dons adjoining. All of these parties are getting out ore right along. John Alexander came down from the While Hill mine last Wednesday. He says the mine continues to show up quite as well as at any former time.

LOOKOUT.—Start furnace on the 10th inst. Everything in and around the mine is looking well. Daily output of ore from South Lookout is six carloads. Have resumed sinking main winze, South Lookout; nine miners employed.

Mariposa.

DEVIL'S GULCH MINES.—Mariposa *Gazette*, May 9: Dr. W. N. Martin has come up to see his mining property situated about 12 miles east of town on Devil's gulch. During the past season the doctor has been to great expense in supplying the necessary machinery to work the heavy bank gravel mines by hydraulic process. About the time everything was in good working order and ready for action, instead of a rainy season as is customary, a season having no rain in it for mining purposes followed up most severely and still continues, hence the property, contrary to all expectations, has been idle and unproductive, all for the need of water. There is a large field of pay dirt and gravel in that section which has never been disturbed by the pick of the delving miner.

THE DILTZ BONANZA.—Captain Diltz was in this week and he informs us that the opening out of the quartz rock upon the face of the new shaft is most remarkable. The outlook of ore exceeds all expectations, for it covers space of 110 feet in width and indicates widening out as the shaft goes down. Captain Diltz is getting out timbers with a view to stoping rock from any portion of the mine desired. It seems almost useless to bring any more ore to the surface until one or two mills are built to get away with what ore is already in sight. Captain Diltz's mode of working the mine by washing away everything in sight through his enormous sluices, and piling up the profitable class of ore will probably be continued by him as long as he owns the mine.

THE BUENA VISTA.—This fine mining property which has about as much traditional history as most any mine in this section, is located but a short distance from the Diltz mine on or near Saxton's creek. Like many others of our best mines, it has had its ups and downs and has really never got into a well-settled groove of honest management whenever an attempt bas been made to work it. This Buena Vista mine has, we are assured, a fine character of ore already developed sufficient to guarantee its going ahead and producing its monthly quota of bullion as much so as most any other mine in this county. It has a new 10-stamp mill and as we are informed it would require but little outlay to set everything going as originally intended when the mill was built. The property has been in litigation for a year or two past and is now offered at Sheriff's sale.

Nevada.

PENNSYLVANIA MINE.—Grass Valley *Union*, May 6: Work on the Pennsylvania mine is progressing very favorably, and the prospects for its developing into a good mine is very flattering. The main incline is down 250 feet, and at that point crosscutting for the ledge is being done, and it is very probable that the ledge will be cut within a few days. On the 175 level some very good ore is being taken out, which shows well in free gold, rich sulphurets and galena. Work throughout the mine is being pushed with vigor, and as soon as there is room for more men they will immediatcly be put to work. There is no doubt but the Pennsylvania will be one of the paying mines of the district in the near future.

MINE PURCHASED.—Foothill *Tidings*, May 6: Last year a party of our citizens bonded the quartz ledge, now known as the Horse Shoe, from J. Mellow and partners and on Tuesday (yesterday), the present Horse Shoe Company purchased the property out and out. The Horse Shoe Company now own the adjoining ground (the Oakland) and it is their intention soon to erect a water-wheel and commence active operation in the way of developing the mine. The Horse Shoe ledge is all the way from six inches to 20 inches in thickness and the ore from it has averaged by mill process, $43 per load.

RICH ROCK FROM THE GREEN MOUNTAIN.—Sims & Co. yesterday had a clean-up at the Rocky Bar mill of nine loads of quartz from the Green Mountain claim which yielded $195.50 per load, without the sulphurets. The highest estimate placed upon the yield of the rock was not exceeding $80 to $90 per load, which would have been a fine yield. From indications the Green Mountain mine will become as noted as formerly for its rich product.

SOLD.—North San Juan *Times*, May 9: The Sweetland Creek Gold Mining Company's mining property has changed hands. A syndicate composed of some 25 Chinamen purchased the property on the 6th and took possession on the 7th instant. It was sold for a good round sum of money, but in our opinion for less than its real value. Ga Sue, of this place, is the agent for the Chinese owners, many of whom are from Dutch flat.

Placer.

FOREST HILL.—Placer *Argus*, May 7; A big clean-up was made at the May Flower mine on Saturday. The May Flower bas been the dispenser of more money on this divide than any company for a great many years. The Washington mine, situated about a mile from Forest Hill, having been freed from the water in the works, has resumed operations this week. The main shaft has been sunk to a depth of 340 feet, and the prospects are regarded as very flattering by those most directly concerned and who are best able to judge. George T. Murdock, an experienced miner, is the superintendent of the mine, which employs fifteen or twenty men. The Baker Divide mine, located on Shirt-Tail canyon, about six miles from here, is said to be giving rich promise. At present the company are building houses for the use of the workmen engaged in the mine. They are also constructing about a mile and a quarter of flume to supply water whereby to run the air compressor. Work in this mine is run mostly by contract, I believe. Wm. Dodge, Jr., is the superintendent.

IRON MINE.—A representative of the *Herald* made a visit to the Iron mine or Hotaling recently, and found quite a number of people in the town and some work going on. A force is at work in the mine taking out ore, of which they have considerable on hand. Marble stone, for slag, is piled up in large quantities, and the immense coal sheds are full to the gable. At the kilns near the works is about 5,000 cords of 4-foot wood, and scattered throughout the woods the company has from 10,000 to 12,000 cords more already cut. Everything around the place would seem to indicate that the company is getting ready for a big run, although nobody seems to be able to answer the question as to when they expect to start up.

FOREST HILL.—Placer *Herald*, May 9: Work has been started up again in the Washington mine, near Forest Hill. A tunnel is being run to tap the shaft at 60 or 80 feet through which the water from the pumps will be emptied to save lifting so high. The shaft, we believe, is down to gravel, and as soon as the water can be gotten out Mr. Murdock, the superintendent, hopes to commence drifting.

Plumas.

FROM WOLF CREEK.—Cor. Plumas *National*, May 9: Away up in the pine mountains of Plumas, two or three hours' ride from Greenville, on the west bank of Wolf creek, is located the mine and mill of the Gold Stripe Mining Company. In the early 50's Wolf creek yielded the placer miner large returns for his labor, and more than one fortune was extracted from its gravelly bed. But nearly all the old-timers have long since abandoned Wolf creek for more promising mining regions, until, at the present time, but one or two of the original miners remain; and they, seemingly loth to forsake the scenes and associations of lang syne, still manage to make a living by turning over again the "tailings" that were worked for the first time more than a quarter of a century ago. Hardly had the placer miner turned his back upon Wolf creek before the quartz prospector came in. Immense quantities of float quartz were to be found on every hand, and it was not many months before several promising ledges were discovered. The owners of these ledges being poor men, but little more than assessment work was done on them for several years. About ten years ago, however, the Gold Stripe Mining Company, (a New York company), purchased the Wisconsin mine, put up a large mill and went to work in good shape. This venture proved so remunerative that another mine, the Great Western, was also purchased by the Company, and extensively developed. These two ledges furnished sufficient ore to keep the mill pounding away for seven or eight years, and during all this time good dividends were realized. During the time that the mill was running there was quite a lively little village on the banks of Wolf creek, and which bore the same name as the creek. But about three years ago the company lost the ledge, and the works were shut down, and since then but little more than assessment work was done. But the indications now are that this dreary monotony will be agreeably varied during the coming summer. Mr. Standart, the superintendent of the company, is now in New York City on business connected with the mine. During his absence a force of six men are engaged in sinking an air shaft to connect with the main tunnel, and a few more days will suffice to complete this part of the work. Mr. Standart is expected back, and he will immediately put a force of men in the tunnel to run it ahead at least 250 feet and perhaps farther. It is thought that by running ahead this distance the main ledge will be tapped, and if so the mill will be at once started up and good times will come again. In addition to the above named mines there are several other ledges that have been more or less prospected. The trouble with these latter is that they are owned by parties who do not possess the necessary capital to develop them, and the probabilities are that these ledges will remain comparatively worthless until capital can be induced to take hold of them.

A VALUABLE MINING PROPERTY.—Greenwich *Bulletin*, May 6: Near the head of North canyon, just below and north of the Round Valley reservoir, is a mining property, or series of properties, which is destined to be in the county second only to the Plumas Eureka. This series of claims, beginning at the bed of North Canyon and extending westward, are, in their order, as follows: First, the Johnny Bull, 320 feet in width and joining on the east end of the Ellis. Second, the Ellis, 1,500 feet in length. Third, the Pacific, joining the Ellis on the west and running nearly at right angles to it, 500 feet in width. Fourth, the Compromise, lying between the Pacific and the Forest King, 200 feet. Fifth, the Forest King, 1,500 feet in length. Fully twenty years ago, ground sluicing on the line of this series of claims was done near the top of the hill. It paid richly. Less than a year ago the Forest King was discovered. Work was begun at one, a mile leased and the ore tested. A large profit was obtained. A second tunnel was run in this mine, which proved that the pay chimney widened, lengthened and became richer with depth. The hauling of ore from the tunnel has already begun, and crushing at the Arcadia mill will commence in a few days. The Ellis is owned by J. R. Drury. In a tunnel run 350 feet, Mr. Drury has fine pay ore in a large ledge. Experienced miners whose judgment is reliable say that it is the best mine in this part of the country, the Green Mountain not excepted. This ledge tapped by a tunnel run on a level with the bed of North canyon, would give 1,000 feet of backs. The extraction of ore from the tunnel which has already been run, could begin at once, but the owner is unable to erect a suitable mill, which should be located at the bed of the canyon. A good site for a mill could be obtained. Situated below the level of the Round Valley reservoir, and but a short distance from that body of water, as the mill would be, an enormous water pressure could be utilized for running the machinery.

INDIAN VALLEY.—About fifteen men are now employed in connection with this mine. A tunnel is being run to tap the Indian Valley shaft. At the junction of the shaft and tunnel hoisting machinery will be placed to be run by water-power. The water from the ditch will be conducted by a pipe down the shaft. The plans and drawings of the necessary machinery, etc., have been submitted by Mr. J. P. Kenner for the consideration of the company. As soon as can be done to advantage, a large force will be employed.

LUCKY S.—Plumas *National*, May 9: Uncle John Hardgrave, of Taylorville, gave us a call Tuesday, and reports this mine running steadily on good rock and is making a good showing. Everything indicates that the owners have a good paying property. The men that put up their money to develop the country are deserving of success, and we hope they may make a fortune out of it.

Sierra.

GRAND PRIZE.—*Mt. Messenger*, May 9; The main tunnel of this company is in 1,660 feet, and now being run through soft bedrock. An upraise was recently made of 15 feet to lava through which a drift was run 25 feet to the apparent edge of the flow where fine, red-colored cemented gravel was found with bedrock at a half-pitch into the mountain. The indications are very favorable for an early development of a rich, wide and extensive pay channel eastward up the ridge—a large tract of unprospected country for miles to the Red Oak mine. The Bald Mountain Co. has just completed a shaft to bedrock on the rich channel they have been working lately, some two hundred ft. further upstream than they have heretofore prospected. A nice looking bed of gravel was found, but it is thought that the lowest part of the channel was not reached. The company will clean out the shaft in Lowel avenue, and more thoroughly prospect the channel at that point. The Young America Company expect to have their wagon road to the ledge from the Sierra valley road completed this week. Carpenters are busy getting out timber for the mill. Haggerty and Garfield will furnish the lumber, and will commence hauling as soon as the road is completed. Mr. Deidesheimer has made arrangements below for ample funds to put the mill in working order, and to fully develop the ledge. The amount secured is said to be $15,000.

THE WALLIS CON.—The Wallis Con. Mining Co. have commenced work in a tunnel at Jim Crow canyon with the intention of running into the ridge for the lead. A special meeting of the company was held at Forest City last week and James Lowell elected as director, to succeed H. C. Stout, deceased. J. O. Jones was elected secretary. This company owns a very valuable tract of mining ground on the ridge above Forest City, and it is only a matter of time when all the owners will probably be made rich out of it.

MILL TO START UP.—Sierra *Tribune*, May 8: The quartz crusher, purchased of Taylor & Forbes, at this place, has been placed in position at the Belmont mine, Poker flat, and will be started up to-day. There are already about 60 tons of ore on the dump. The mill will crush about five tons of ore per day and the owners do not anticipate any trouble in keeping it running steadily. We expect to receive some good reports from the Belmont mine in the near future.

THE SUNNYSIDE.—At the Sunnyside gravel mine, the main tunnel has been run in 300 feet. A raise of 40 feet was made from the face of the tunnel and a drift run ahead from that 60 feet. From the present indications it is expected to strike the channel in about 200 feet. The owners of this claim are Messrs. Hougb, Dorsey, Carmichael and Reynolds.

BULLION YIELD.—One hundred and fifty ounces of gold is what the Bald Mountain Extension Company, at Forest City, cleaned up Sunday as a result of their week's work in the South fork ground. The total yield of that mine for the month of April was 753 ounces of gold. Not a bad showing.

WORKING IT UP.—H. H. Purdy, who has control of the Good Hope quartz mine, at this place is negotiating with parties below to operate the property. The Good Hope is known to be a good mine.

BUNKER HILL.—At the Bunker Hill claim, situated near American Hill, they are in fine quartz gravel. A gangway is being run to the right of the main tunnel at present.

Shasta.

PROSPECTING.—Shasta *Democrat*, May 6: About 20 prospectors are on Squaw creek hunting for gold leads. It is thought that the Bullychoop tollroad will be completed in about 6 weeks. Several miles of the worst part of the road have been finished. Messrs. Hughes, Scott and another gentleman have struck a fine prospect of silver ore on the Silver King belt north of the Silver King. The ore assays in gold as well as in silver. Mr. Russ, an old Buckeye miner, recently struck a rich pocket near Buckeye and has been taking out from $10 to $30 per pan, and it does not appear to be near worked out yet. The Whitton & Small mine on Squaw creek was bonded last week to San Francisco parties for a period of 5 months for $10,000. One thousand dollars was paid down Mr. J. W. Stoufer, assayer, returned yesterday morning from a trip through the Backbone region. He went over considerable of a mineral belt where, in his opinion, some good mines will be discovered. The people of Copper City are elated. The Winthrop Mining Company have milled about 20 tons of ore with very satisfactory results, and have proven beyond a doubt that they can work the refractory ore and make a good profit. The company is building another furnace and intend to further enlarge their milling capacity. The Scott Valley *News* says that much interest is manifested in mining circles over the projected draining of a creek fabulously rich in placer gold, but cannot be worked owing to the great volume of underground water. This stream to the extent it has been worked has paid remarkably well in former times, and if the scheme of drainage is succesfully carried out vast sums will undoubtedly be extracted. A. J. Loomis and others of Red Bluff are interested in the move. Two mining men from Arizona, Messrs,

Gilchrist & Finley, in company with Jim Brincard and Andy Fife, have located a gold quartz vein on Salt creek a short distance this side of Lower Springs. Formerly the mine was owned by John Tiffin and a man by the name of Tilden, who years ago sunk a shaft on it and took out rich rock near the surface, when the pay run into heavy sulphurets which they could not handle, and finally they practically abandoned the mine. The new locators have pumped the water out of the old shaft and at the bottom found ore that assays between $4.000 and $5,000 per ton in sulphurets. Messrs. Gilchrist & Finley claim that the rock is tellurium gold rock, a character of ore they came to this county especially to find.

Tuolumne

ARGENTUM.—Tuolumne *Independent*, May 9: Argentum mine, 8 miles N. E. of Columbia, is looking well. They have a 36 to 40 inch vein, which shows first-rate. They washed up Saturday night, after a run of 60 tons of quartz, which yielded $10 per ton in free gold. The rock is also heavily charged with sulphurets, which are estimated to be worth $2,000 per ton. It is cotemplated to increase the capacity of the 5-stamp mill to 15 or 20 stamps. It is also the intention to build a road from Columbia to Italian Bar, and also to the mine. It is considered cheaper to locate the mill at the river, as there can be obtained unlimited water-power, and the rock can be delivered there, from the mine at 50 cents per ton.

RIVERSIDE.—It is said that Messrs. Grove & Star, of San Francisco, owners of the Riverside, will start up that mine right away. They will continue work on the lower tunnel, which is now in about 400 feet, and push it until they strike the main pay chute. This will tap the vein some 400 feet below the surface. They will also put a force in the upper works and get what ore they can, until the main chute is struck below by means of the tunnel.

Messrs. Bluett & Prof. Shrall have struck some pieces in their mine on the Italian Bar trail. Wm. Erwing has been gathering in a few chispas from his mine during the past spring. Prospects are very favorable at the Gem mine, near Gold Springs.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Virginia *Enterprise*, May 9: The main southwest drift on 1,750 level has been turned a little more to the south in order to avoid the bad working ground of the burned out stopes, and come to a connection with the Gould and Curry 1,700 level sooner for air connection. About 40 tons per day are extracted from this level on company account, assaying about $20 per ton on the average. The ore is worked at the Morgan mill, on the Carson river. The ore stopes of the old bonanza section, between the 1,550 and 1,200 levels, are yielding over 100 tons per day, assaying about $21.50 per ton on the average. This ore is extracted under the Jones lease, and is worked principally at the Eureka mill, on the Carson river. The heavy timbers for the new gallows frame over the old Consolidated Virginia shaft are being prepared, and the frame will be up in working position in about two weeks.

HALE AND NORCROSS.—The big hydraulic pump kept up its lick steadily yesterday, reducing the flood of hot water quite rapidly. Last evening it had it reduced down to the cap timbers of the 3,000 level and the drainage of that level was commenced. Superintendent Keating says he expects to have both levels sufficiently drained and cooled off to resume work on both the 2,900 and 3,000 levels the first of next week. The much needed ventilation from the Combination shaft cannot be secured until the water is out of the 3,000 level.

OPHIR.—An upraise will be started to-day from the 500 level, to connect with the old Mexican shaft. The water has been slowly draining from the shaft, through this level, for some time past, and now it is thought feasible to make connection with it by means of this upraise. The waste from the explorations of the Mexican and Union Companies, on their 500 level, and also that of the 1,500 level explorations of the Consolidated California-Virginia Company, is all hoisted through the Ophir shaft.

BALTIMORE CONSOLIDATED.—The new roasting furnace is about completed, and the tributers working on the 450 level will shortly hoist their accumulated ore to the surface to be dry crushed, roasted and amalgamated. They have over 100 tons of it. The parties working on the 225 level are finding some very good ore, which they are saving for future reference.

CROWN POINT.—Under the Jones superintendence and management, the low-grade leavings from the old bonanza sections are being actively extracted, after the style of the Jones lease in the old bonanza sections of the Consolidated California-Virginia.

ALTA.—Some more small stringers and feeders of good ore have been found in the prospecting above the 950 level, which are being extracted and saved for reduction. They may lead to a bonanza of some kind yet.

YELLOW JACKET.—Stoping out the large reserves of low-grade ore in the old upper workings still progresses at a lively rate, from the 1,200 level up. The supply seems almost inexhaustible, and the ore is of pretty good grade.

CHOLLAR.—No new feature has, of course, been developed in Chollar except a full proportion of the hot water borrasca invading its adjoining neighbor, the Hale and Norcross.

KENTUCK.—The extraction of low-grade ore supplying the Rock Point mill, on Carson river, goes right straight along, and the old stopes hold out well.

MEXICAN.—The joint Union and Mexican drift, running north on the 500 level, is being advanced at the rate of 50 feet a week in good working ground.

GOULD AND CURRY.—On the 1,000 level the main lateral drift south is still being advanced at the rate of about 50 feet per week, toward the Savage.

OVERMAN.—About 10 tons a day of low-grade ore are now being extracted from the 226 level, through the old Petaluma-street tunnel.

SIERRA NEVADA.—Good work is being done in advancing the main north lateral drift, the ground working well.

BEST AND BELCHER.—The northwest drift from the main north lateral drift, on the 1,000 level, is being steadily driven ahead.

BELCHER.—The old upper workings still continue their regular yield of low-grade ore, with plenty of it in sight.

Centennial District.

BLUE JACKET.—Elko *Free Press*, May 8: The Blue Jacket mine, in Centennial district, in the northern portion of this county, which belonged to the estate of Thomas Blythe, the deceased San Francisco millionaire, has been purchased by James B. White, for $135,000, and work on the mine will soon be resumed. Monday evening J. M. Dawley, J. D. Dunlap and W. D. Fredericks arrived from San Francisco on their way to the mine for the purpose of taking charge of the property. While here Mr. Dawley purchased a team from W. T. Smith, and will take out the necessary provisions, etc., from Tuscarora, for which place the party departed Wednesday morning. A force will be put on at both the mill and mine. This is considered valuable property, though it has not been worked for several years. The resumption of operations will undoubtedly make things lively in that district.

Dun Glen District.

LOOKING WELL.—*Silver State*, May 8: Stephen Thomas, who came over from Dun Glen yesterday, reports the Ross mine as looking well, the mill as running steadily on gold-bearing quartz. Thomas & Hendra are working the Good Hope mine, and have now about forty tons of ore out, much of which is rich in gold. Heretofore they have been reducing the ore in an arastra, but they have concluded to ship some forty or fifty tons to J. F. Clark's mill, on the Humboldt, below Mill City, and have it worked. There are several gold-bearing veins in Dun Glen, but only the Lang Syne, or Ross mine, and the Good Hope are being worked at present.

Tuscarora District.

MAYFLOWER.—*Times-Review*, May 5: The Mayflower mine near the North Belle Isle bids fair to develop into one of the principal bullion producers of the district. It is owned by Frank Parsons and Geo. Bird. The incline is down 40 feet. The ledge is of good proportions and well-defined and is producing at that depth a considerable quantity of antimonial silver ore of a high grade. It has continued to improve from the surface and the present indications justify the presumption that a short distance below a compact and continuous vein of the same character of ore will be developed.

NAVAJO.—Drift and cross-cut on the 650-foot level were extended 58 feet the past week. On the 350-foot level the work was advanced 56 feet. West cross-cut, 150-foot level, extended eight feet. Fair progress made with the work at all other points.

INDEPENDENCE.—*Times-Review*, May 8: Fair progress is being made in the upraise from the 400-foot level. Repairs in No. 1 shaft are nearly completed, nothing special at any point to note.

ARIZONA.

MORENCI.—Clifton *Clarion*, May 6: The mines of the Detroit Copper Company have never looked more promising than at the present time, particularly the Yankie and Montezuma. Large bodies of ore have lately been opened up in what is locally known as the West Yankie, which, from its position in juxtaposition to the wire tramway, on which two intermediate stations have been erected, renders the ore comparatively easy of access from the said stations. The ore is transferred to the Montezuma ore shoots. The portion known as the Middle Yankie is showing large and extensive bodies of blue carbonate ore. The ore from this part of the mine was formerly conveyed to the furnaces by means of a burro train, but is now connected with the main Yankie shaft by means of a 200-foot tunnel, and hoisted to the surface by means of a 25-horse-power hoisting engine, thus effecting a saving of $1 on every ton of ore hauled.

IDAHO.

WOOD RIVER.—Salt Lake *Tribune*, May 8: Mr. James McGregor came down from Wood River yesterday, and reports the camp on the river very quiet. The trouble with the Miners' Union is ended, and a large number of mine owners made a reduction of wages on the first instant to $3.50 per day, to be followed by all others on the 15th. Mac. says times are liable to remain quiet for some time, but a large number of moneyed men are expected to visit the river during the present summer to look about for investments, and he anticipates during the fall some transfers of property. Generally speaking, the mines and prospects are all looking well, and every indication points to permanent prosperity. Men with small prospects are holding on tenaciously, prospecting carefully as they go, in anticipation of a revival of better times, when they hope to make sales or secure sufficient capital to develop ther properties. Mr. McGregor thinks the general reduction in wages of 12½ per cent will result in the employment of 20 per cent more men, largely increased shipments of ore, and prove an advantage by way of inducing the investment of outside capital.

A MILL FOR THE GOLD BELT.—Wood River *Times*, May 6: The first wagon load of machinery for the mill to be erected at the head of Rock creek left Hailey yesterday, and the remainder will be hauled out to the site before the machinists are ready for it. The foundry work alone weighs over 40,000 pounds. The mill will be erected and got ready to run as rapidly as possible. The property of the company constructing the mill is said to be bonded to an Eastern syndicate for $300,000, the bargain to be a sale provided the ore pays a certain profit per ton by mill process. It is not certain that it will, however, as the character of the ore may be such that a different process may be required. But as there is plenty of ore there, if the first process tried does not extract the precious metals, very little time will elapse before the right process shall be ascertained and applied. If the mill about to be erected works successfully the Rock and Camp creek district will be the seat of as big a mining boom as was ever seen anywhere.

NEW FINDS.—Houston *Press*: During the week past several good prospects have been located near the head-waters of the Alder and Antelope creeks. Some finds of very fair ore were made on the divide a little north of the Big Copper group, and some fine specimens were brought in from the foothills west of town. From one of the finds on Alder creek—a ledge which has been traced nearly a quarter of a mile—a specimen was brought in which assayed 168 ounces in silver and 23 per cent in lead. This promises to turn out to be another bonanza mine for Big Lost River. The mining outlook is brightening very rapidly in this section.

FROM RESURRECTION DISTRICT.—J. A. Edie is in from Silver creek and Resurrection district. He says about the only development work going on there is on Hon. John Hailey's claim, which is showing up magnificently. The ledge is "so big you can't tell how wide it is"—probably from 60 to 100 feet. Assays run from nothing to $200—gold and some little silver. There is about 500 tons on the dump, that ought to average $20 under the stamps. Mr. Hailey will be here some time this month, and will probably take immediate steps to erect a mill on Silver creek or near the mine.

LOST RIVER.—Wood River *Times*, May 6: The usual high water in Big and Little Lost rivers has been much below the average this spring. The Monarch mine, owned by Messrs. Curtis & Driscoll, is now classed among the best ore-producers. Clayton is reported to be a lively camp—one of the best, in fact, in the country, all things considered. The smelter started up a few days since, and money is plentiful. A big strike is reported in the Alice mine. Just how extensive it is, is not known as yet.

MONTANA.

MONTANA.—Butte *Miner*, May 6: Everything about the mines and works of this company show a remarkable activity this week. Preparations are being made to put in position another new boiler at the Colusa mine. This makes the second boiler put up by this company in the past few weeks. At the company's smelter everything is in working order the same as usual.

PARROTT.—During the past four or five days work at the mine has been resumed, and about 70 men are now employed there, under the foremanship of B. Tibbey, in extracting ore. At the smelter things in general have assumed a rather more busy appearance, and some 60 men are now at work there. The concentrator will start up to-day, everything being in readiness, while the reverbatory furnaces, it is expected, will be running again in full blast by the 10th inst. In fact it is conceded by that time everything will be working except the old concentrator.

GREAT EASTERN.—Ore taken from the bottom of the shaft is of excellent quality, avcraging from 50 to 80 ounces. Some three years ago a large, rich boulder, about a ton in weight, was found near the surface where the shaft now is. The boulder assayed 328 ounces in silver, and the owners of the property are now confident they have struck the ledge from which it is supposed to have come. Consequently they are vigorously at work in timbering and sinking the shaft.

ELLERMALOU.—A rich strike is reported at this mine which is located about three miles to the northwest of Butte. A rich vein of ore which runs way up into the thousands has been cut near the surface. On last Thursday seven tons of this ore were extracted from what is known as a blanket lead, but which is now dipping into the earth at an angle. A shaft will be sunk immediately.

ALICE.—The work of sinking the main three-compartment shaft has steadily progressed until the 800-foot level has almost been reached. This will require but a few more days when a station will be cut. The Alice still holds its reputation as the best paying investment of capitalists west of the Rockies. To-morrow's shipment will include 14 tons of bullion, with an aggregate value of $12,000.

SWANSEA.—During the week another cross-cut has been started from the main drift, running north, which looks exceedingly well. A small lead of rich copper-silver ore has been struck, which gives rich promise. Another cross-cut on the same drift on the 200-foot level is entirely in vein matter. The mine is being thoroughly timbered and the work of prospecting progressing rapidly.

BUMMER.—Work on this property is progressing rapidly and a ledge three feet wide of 40-ounce ore is looking more favorable as depth is attained. About 30 tons of this ore was shipped last week to the Lexington mill for reduction.

WILD BILL.—Stoping continues on the upper level, while the drift in the lower level is in about 80 feet, and looking well. About 100 tons of ore per week are taken out and shipped to the Oxford Copper Company at Constable Hook, New Jersey.

LITTLE DARLING.—During the past week a great deal of new work has been done and the ore bodies are improving. Some 25 men are now employed and the mine is furnishing sufficient ore to keep ten stamps at the Lexington engaged.

COLUMBIA—Stoping which has been progressing of late, will cease and during the coming week the work of sinking the shaft will be resumed. About 25 tons of ore of excellent quality is taken out every week.

CHIEF JOSEPH.—The low-grade ores of this mine are being shipped as fast as taken out. The main drift is now in about 70 feet from the shaft, and progressing.

MOUNTAIN VIEW.—From south vein on the 600-foot level some very rich ore is being taken out, which appears to be gradually improving.

THE UNION.—Continued development of this mine indicates that it is one of the most promising mining properties in the district.

OREGON.

THE CLEVELAND MINE.—Bedrock *Democrat*, May 4: Many rich discoveries of quartz have lately been made on Burnt river, but probably the one on which the most work has been done is the Grover Cleveland, situated about twelve miles from Huntington and four miles from Weatherby, and one mile from the place known as the Jordan ranch. The O. R. & N. Co.'s railroad passes within one mile of the mine. At the southern boundary line of the claim an incline has been run for 60 feet, at the end of which, 30 feet below the surface, a ver shaft has been sunk about 35 feet from the bottom of which shaft drifts have been run on the ledge—south 50 feet, north 30 feet—showing the ledge and walls 60 feet below the surface. At this level the ledge is 33 inches wide, with well-defined walls—foot-walls of porphyry and hanging walls of slate. The ore is very largely decomposed and carries free gold. It is a white quartz, full of sulphurets of red and dark brown color. In much of the ore native gold can be seen, but the richest is that which is banded and spotted with dark sulphurets. Most of the latter is exceedingly rich, and assays made by D. C. Marchand, of this city, has given it as high as $800 to the ton. A great deal of the ledge matter is so soft that it can be easily crushed in one's hands. The location of this mine facilitates opening by cross-tunnels, as the hill is very steep and the vein running with hill or ridge can be cut hundreds of feet vertically below the out-cross with comparatively short tunnels, which would dump the ore on to a smooth hillside a short distance above the Connor creek wagon road, and by the use of chutes the ore could be easily conveyed from the dumps to a wagon on the road, thence to the O. R. & N. railroad track. It is the intention of the owners to ship several hundred tons of the ore to Salt Lake City over the Oregon Short Line, and there to go through the reduction works. In the same mineral belt as that of the Grover Cleveland, other discoveries have been made of exceeding richness, and upon which considerable work of development is now progressing. The gentlemen interested in these discoveries are live and energetic, and no stone will be left unturned by them that will tend to the opening out to the world the mineral wealth of their prospects. We look upon it as fortunate that Baker county has at last received as citizens men whose whole feeling goes into their work, and which will tend to the advancement of the mining resources of the entire county and Eastern Oregon.

GOOD ASSAY.—The owners of the Enterprise mine, located in the upper end of the town, sent some of their rock to Portland this week for assay, and the answer is that it goes $50.25 in gold with traces of silver. To bring matters into shape an incorporation will be formed composed of the following gentlemen: J. G. Birdsey, J. Nunan, Wm. Hanley, J. A. Cardwell and I. W. Thomas. It is the intention of the company to continue the work right along, and they now feel confident that they have struck a bonanza.

NO FAILURE YET.—*Sentinel*, May 9: While meandering around yesterday afternoon we dropped into C. C. Beekman's express office when we saw him put up a package of 25 pounds of gold dust, the result of the week's purchases from the miners living near by. The mining season has been an exceedingly poor one on account of the scarcity of water, but this showing proves that we have good paying ground if we only get water to work it.

UTAH.

REVIEW.—Salt Lake *Tribune*, May 8: The output of bullion from this point for the four months of the present year, excluding all ores, and aside from recent Horn Silver shipments and some concerns which make no current reports, has been $1,240,936.30. The week ending May 6th, inclusive, was generally warm and clear, with but occasional brief storms, all save one very light. The movement of ores and bullion has therefore been fair. The receipts in this city during that week were $82,572.58 of bullion and $13,060 of ore, a total of $95,632.58. For the week previous the receipts were $63,372.65 of bullion and $3,850 of ore, a total of $67,222.65.

The Ontario shipped during the week 45 bars of bullion, $31,665.71, raising the total shipments of the year to date, to $601,007.51. The mill is now shut down, we understand, for the annual clean-up and repairs, so no more shipments are expected for a fortnight or more. The regular monthly dividends continue with unfailing regularity of 50 cents per share. Receipts from Silver Reef for the week have been of Christy silver, 4 bars, $8,510; Stormont silver, 4 bars, $5,920; a total from the sandstones of 8 bars of silver, assaying $14,430. The Hanauer smelter produced during the week 9 cars of bullion, $19,750. The product of the Germania smelter was 4 cars, $8,706.87.

SANDSTONE NOTES.—Southern Utah *Times*, May 6: The Christy company has crushed an average of 45 tons of ore during the week. The air connections in the New Shaft are completed, and a force of men can be put to stoping out ore at any time. The California is looking fine. The bulk of the ore which runs the Christy Mill at present comes from this mine. The mine continues to improve the more it is worked. The Vanderbilt, about which there is so much talk of late, continues to show up more and more as a bonanza. The drift at the bottom of the 134-foot incline is run on the ledge twenty feet north and thirty feet south. The whole drift is in ore and there are twenty tons of high grade ore on the dump which has been taken from this part of the mine. The face of the drift is in ore from top to bottom. What she will be time will tell, and judging from present indications we think she will be immense. The Lamb & Steele is an extension of the Vanderbilt. Dick German continues to develop the mine in good shape and is taking out some very good ore. He is working for and expects to find a continuation of the Vanderbilt ore body lately struck on his claim. Winze No. 29, running between the fourth and fifth levels at the extreme south end of the Savage, is completed. A body of fine ore is opened up by this winze, which the miners have begun to stope out. A body of fair ore is exposed in the stopes of the sixth level south, which is being worked at present. The mine is producing a daily output of between 30 and 35 tons. The Thompson & McNally is furnishing between 12 and 15 tons per week. There is an abundance of ore on the dumps, and unless some act of God interferes to wash out the roads or flood the Virgin river the company's mill will continue to grind out its regular amount of ore daily—between 35 and 40 tons. Holling & Dawson have made a shipment of 50 tons of ore from the Gisborne mine, which is situated on the White Reef just south of the Thompson. The ore sampled 40 ounces. A force of men is still engaged in extracting ore. Bailey, Nesbit & Co. are working three shifts at their Leaching Works over at the old Leed's mill. They run 25 tons of tailings through their leacher every 24 hours.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.

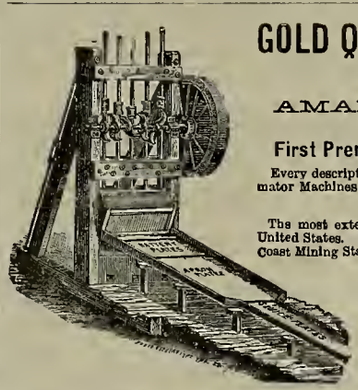
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.



GOLD QUARTZ and PLACER MINERS

Silver Plated

AMALGAMATING PLATES,

For Saving Gold

First Premium Awarded at Mechanics' Fair, 1884.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought or gold separated for low percentage of result.

A Glance Over the Mining Field.

The Granite Mountain and Hope mines and mills at Phillipsburg, M. T., are in full operation. The former produces from $3,000 to $4,000 per day in silver bars, and the latter from $800 to $1,000 per day.

The Cornish pump at the Alice mine, Butte, Montana, cost $57,118.

As showing what "discount" on silver means, the Alice mine, Montana, yielded between January 1st and April 1st, $262,272, with $47,772 off for discount on silver.

Wells, Fargo & Co. have closed their office at the Vulture camp, Arizona. The business of that office was mainly derived through the mining company in the shipment of bullion, and the recent loss of $6,000 by highwaymen has convinced Wells, Fargo & Co. that the profits derived are too little to run such large risks in the future.

One of the largest copper properties in Arizona has just been located, about twelve miles west of Tucson. It is said to be a mammoth quarry of splendid ore.

Mr. Carl Henrich, lately superintendent of the Detroit Copper Company's smelting works at Morenci, Arizona, has left San Francisco for New Zealand, where he is to erect and manage copper smelting works, the plant for which has been built by Messrs. Frazer & Chalmers, of Chicago.

The Shasta *Courier* says that the town is full of men bound for New River. One of the prospectors passed up with a pack mule on which hung a label reading: "This fellow has packed grub and blankets for me to Denver, Leadville, Deadwood and Tombstone, and now we are bound for New River to strike our eternal fortune and live on barley and beer for the rest of the time allotted to us on earth."

The shipments of little dabs of gold from Lone Pine, Inyo county, during April, aggregated about $13,400. Most of the metal came from Beveridge. This is quite a nice little sum to be added to the business of a village during one month.

The Nevada *Transcript* says that Postmaster Williams has been figuring a little, and he finds that during the past 22 years there have been shipped through Wells, Fargo & Co.'s express office at Nevada City gold bullion weighing in the aggregate 50 tons avoirdupois. This represents considerably less than half (probably about one-third) of the gold produced by the mines of Nevada county within the time specified, the other bullion shipping points at present being North San Juan, Sweetland, French Corral and Grass Valley.

The last week's work of the Bald Mountain drift gravel mine, Sierra county, cleaned up 209 ounces of gold—a pretty good showing. The mine yielded in April 753 ounces of gold.

The new works of the Selby Smelting Company, at Vallejo, will soon be completed. A shaft sunk to obtain fire-clay has struck what seems to be an endless supply of the material.

The Carson & Colorado Railroad is said to be doing a better business now than for many months. This looks well for the mining region thereabouts.

From a twenty-five days' run of the Delhi quartz mine, near Columbia Hill, a bar of gold was produced worth $6,000, the cost of producing it being $1,200.

Dan De Quille has an article upon "Americans as Silver Miners" in the issue of the Chicago *Current* of May 2d. He describes the crude methods under which the first mining operations were conducted, and tells how, by close attention to the work and inventions made upon the spot, Americans have come within a comparatively few years to be the best silver miners in the world.

The concentrations from the Paradise Valley Company's mine are worth $650 per ton. About 27,000 pounds were shipped to Omaha the other day.

As indicating what very low-grade gold ore can be worked to profit in this State, where there is plenty of it, it may be stated that over 80,000 tons of ore were worked during the past two years by a mill in Calaveras county, the yield per ton, ranging from $1.80 to $1.95 per ton. The ore assayed a little more, but all was not saved.

The Virginia *Chronicle* says: "The bullion product of Storey county for the year 1885 will foot up over $8,000,000 or nearly $550 per head for the entire population."

The New River fever has abated somewhat, and prospectors seem to think Shasta and eastern Trinity afford a much better field for prospecting than the much-talked-of new El Dorado.—*Shasta Democrat.*

Mining Share Market.

Business has been rather active in the stock board this week, and prices indicate that there is hopefulness in the Comstock situation. The breakage in the discharge pipe of the big hydraulic pump at the combination shaft has caused considerable trouble, but the water is now nearly all out again. Still this accident did not seem to affect the market much, as such changes usually do. The low-grade ore bonanzas of the north and south ends show an increased yield, and are the main feature of the Comstock ore production, if not the sole future basis of its mining prosperity. It certainly will prove to be so, unless the much hoped for bonanza in the middle mines develops into a tangible reality. From 80 to 90 carloads a day pass over the railroad from Virginia and Gold Hill, the south end furnishing a slight majority of it.

The total amount of the pay-rolls of the Comstock mines for the month of April was about $110,000, of which the Crown Point, Belcher, Yellow Jacket and other Gold Hill companies have paid about one-half.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco:

WESTERN MILL AND LUMBER CO., May 11—Object, manufacturing, buying and selling of lumber, buying, selling and improving real estate, and transacting a general merchandise business in the State of California and Washington Territory. Principal place of business, San Francisco. Directors—John F. Kennedy, Daniel L. Randolph, Angus McLeod, Sampson Tams, A. J. Turner, Colin M. Boyd, H. J. McLerie. Capital stock, $250,000, divided into 2,500 shares.

CALICO MINING AND REDUCTION CO., May 11.—Location, Daggett, San Bernardino Co. Directors—Valentine Baltz, John Kremer, Dr. Julius Koebig, H. J. Forchini. Capital stock, $30,000, in 300 shares.

NORMAN MAUD M. CO., May 12.—Location, Yuba Co. Directors—Chas. H. Wells, A. A. Hobe, Geo. J. Hobe, W. S. Moses and Chas. E. Hazeltine. Capital stock, $14,400.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

FRIEND to the rich and poor—Muller's Pebble Spectacles, 135 Montgomery St., near Bush.

Market Reports.

Lumber at Wholesale.

The Redwood Lumber Association has established the prices since the first of the year.

REDWOOD.—Cargo prices are at present as follows: Rough, merchantable, ₱ M ft., $13 00; Rough, clear and surfaced, $23.00; 1x10 Rustic, No. 1, $24.00; 1x10 Rustic, No. 2, $19 00; 1x8 V Rustic, No. 1, $22.00; 1x6, tongued and grooved, $21.00; 1x4, tongued and grooved, beaded, $23.00; ½-in.x3, Battens (board measure), $30.00; Shingles, ₱ M, $1.05.

Pine—Rough, $15.00; No. 2, $12 00; do do in lengths, $13.00; rough, 40 to 50 ft lengths, $16.00; do 50 to 60 ft, $17.00; T and G Flooring, 1x6, $26.00; do do 1¼x6, $28.00; do do 1x4, $28.00; do do No. 2, $21.00; Vertical Grain T and G Flooring, 1x6, $30.00; do do do 1¼x6, $32.00; Stepping, $37.50; Furring, 1x2, per lineal ft, ¾ c.

Utah and Montana Machinery Company.

A company bearing the above title was organized in this city on the first of this month. The object and business of this company is to buy, sell, manufacture and deal in all kinds of mining, milling and other machinery, engines, boilers, mining supplies, iron and steel, and real estate. The capital stock is $50,000. The incorporators are L. C. Parke, B. T. Lacy, Joseph Powning, C. P. Mason, H. C. Newhall and J. O. Harron. The officers are L. C. Parke, president, B. T. Lacy, vice-president, J. O. Harron, secretary; C. P. Mason, manager. The treasurer is banking-house of T. R. Jones & Co., in Salt Lake city.

This company is the successor to the old house of Parke, Lacy & Co., at Salt Lake, Utah, and Butte, Montana. They will run in the same line as Parke and Lacy do here.

At both the towns mentioned establishments have been maintained, but will be continued hereafter by the incorporation under the new business title.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING MAY 5, 1885.

317,072.—SUPPORTS FOR CENTERS OF MASONRY ARCHES—C. H. Ackerson, S. F.

317,288.—FOLDING DESK—D. D. Bowman, Eureka, Cal.

317,106.—SIDEWALK AND PAVING BLOCK—Henry G. Fiske, S. F.

317,107.—ARTIFICIAL FACING BLOCK—Henry G. Fiske, S. F.

317,108.—PAVING BLOCK—Henry G. Fiske, S. F.

317,013.—SEED SOWER—Jacob Price, San Leandro, Cal.

317,021.—FOOD FOR CALVES—Sam'l Sanborn.

317,041.—CARTRIDGE—Wm. Subleh, S. F.

317,044.—RAILWAY CROSS TIE—H. Thielsen, Portland, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FOOD FOR CALVES.—Samuel Sanhorn, S. F. No. 317,021. Dated May 5, 1885. This is a preparation which is to be used as a food for calves and young animals in the place of or as a substitute for milk; and it consists of a combination of nutritions ingredients. These ingredients are mainly sugar, nat-meal, salt, phosphate of lime, phosphate of sodium and soda mixed in suitable proportions.

MACHINE FOR GUMMING AND SHARPENING SAWS.—John Richardson, S. F. No. 316,570. Dated April 28, 1885. This invention relates to the class of machines used for gumming and sharpening saws, in which an emery or file wheel, adapted to be moved by the various adjustments of the machine to whatever position is desired, is employed to do the grinding or filing. The invention consists in a machine in which certain adjustments can be made, the object or result of which is to throw the wheel to whatever position may be required, in the best possible manner; and also to various constructions by which these adjustments are made and the wheel driven. The main adjustment to approach the wheel to the saw is given to the frame of the machine, which is adapted to be moved to any inclination on either side of a vertical line. The further adjustment of this nature, and also to throw the wheel itself to whatever angle is necessary to conform it to the edges of the teeth, is given to a cross-head or bar sliding on and pivoted to the frame, whereby it may be drawn back and forth and turned to any inclination on either side of a horizontal. A further adjustment back and forth is given to the wheel shaft directly, to fit the wheel accurately to the tooth, and a certain arrangement of belt and pulleys is made in connection with the machine, which will permit these adjustments, and yet continue to exercise their function in driving the wheel.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—San Louis Obispo and Santa Barbara Co.
GEO. MCDOWELL—Santa Clara and Santa Cruz Co's.
G. W. INGALLS—Arizona.
M. S. PRIME—Alameda County.
MRS. OZIER—California.
E. L. RICHARDS, San Diego, County.
F. W. SMITH, New Mexico and Arizona.
W. B. TURNER, California.
R. E. BUSH—Shasta, Tehama and Trinity Cos.
M. C. BAKER—Napa and Yolo Cos.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the intcrests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its valumore widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

A NEW WORK ON ASSAYING

Lead, Copper, Tin, Mercury, etc.

BY C. H. AARON.

For Practical Workers. Price, $1.75.

The new book is entitled "Assaying Parts II and III," as Part I treated of Gold and Silver Ores alone. The book is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Mr. Aaron is an experienced metallurgist who has devoted many years to assaying and working ores on the Pacific side of the American continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores," and "Assaying - Part I") that have been successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of miners, assayers, prospectors and millmen.

The following abstract of the table of contents will show how comprehensive the work is: Gold and Silver Bullion; Apparatus; Melting Bullion: Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, $1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

A $3.50 Premium for $1 to Subscribers of this Paper.

Picturesque Californian Homes.

A VOLUME OF

Forty Plates, Plans, Details and Specifications of Houses.

Costing from $700 to $15,000, and adaptsd to Families having Good Taste and Modsrate Means.

CITY AND COUNTRY HOMES.

This work is designed to meet the wants of that large number of persons who have but a limited amount of money at their command, and in building a home wish to uss it to the best advantage. Drawn by Samuel and Joseph C. Newsom, Architects, San Francisco, who have taken much pains in its preparation, and confidently assert that mechanics, clerks, salaried men, workingmen of every calling contemplating building, carpenters and builders in cities, towns and villages, will find this book a useful aid, worth many times its cost in the information and practical suggestions which it gives.

The Plans are clear, and finely drawn on Lithograph Plates, and handsomely printed; size, 9x13 inches.

Subscribers to this paper (old or new), who pay one year in advance of the date of application for this premium, can have the same by paying $1 additional. Sent by express unpaid, or on receipt of $1.10 postpaid.

The California Perforating Screen Co.

Al kinds of Quartz Screens, slot or round holes; zinc, copper and brass for

Flour and Other Mills.

Quartz Mill Screens a Specialty.

Land Business at Washington.

Having associated with us able counsel at Washington, we are now prepared to obtain Patents upon Pre-emptions, Homesteads, Mines, Mexican Grants, and all classes of Land Entries; and to manage contests before the Commissioner of the General Land Office and the Secretary of the Interior. Advice will be furnished upon favorable terms. All business will be attended to promptly and on reasonable terms.

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

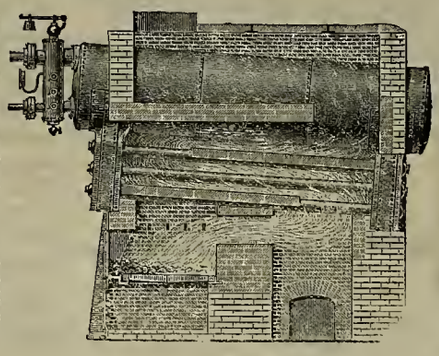
HEINE PATENT SAFETY BOILER

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

Nos. 129 and 131 Fremont Street - - - SAN FRANCISCO, CAL.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. Those CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATES BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 126 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

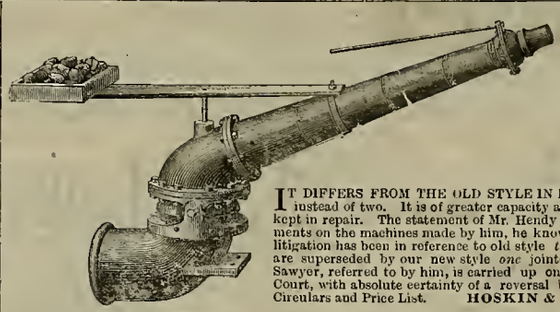
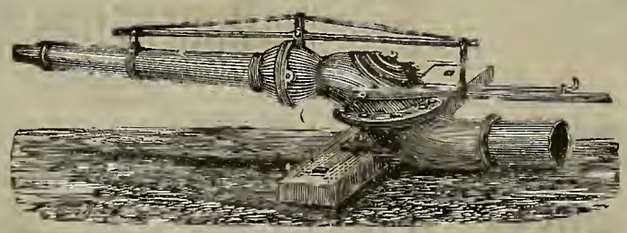
PATENTS. Thousands of Inventors throughout the Pacific Coast can and will willingly attest to the promptness, reliability and success of Dewey & Co.'s U. S. and Foreign Patent Agency. No. 252 Market St., Elevator 12 Front St., S. F.



THE CUT REPRESENTS OUR
IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. ☞Send for Circulars and Price List. HOSKIN & CO., Marysville, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All other styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

VOLUME XLXX Number 21.

Improving Sediment-Bearing Streams.

In order to improve torrential streams in a permanent manner it is necessary to determine how the formation of detritus can be decreased, and how the detritus can be stored near its sources. The leading principle of any improvement is to attack the evil at its very source. Small slides and erosions, in their first stats of formation, can be stopped easily at little cost, but if allowed to attain larger dimensions, they become rapidly more powerful, and require much more extensive and costly works.

In the southern and central part of Europe they have been dealing with these questions in a practical manner for many years, and a study of the work of European engineers, in reference to the permanent improvement of sediment-bearing streams, cannot fail to be of service to the solution of this question in California.

A short time since Mr. Geo. J. Specht read and elaborate paper before the Technical Society of the Pacific Coast, giving a resume of the work of this class done abroad, and describing the systems adopted for restraining the debris. Mr. Specht says the protection of the shores against undermining and the bed against erosion is principally done by the erection of "thalsperren." The German word for these structures is more significant and comprehensive than the English expression, "restraining wall." It includes works which are not walls, but have the same duty, but in a less degree.

A thalsperre, says Mr. Specht, is a structure erected across the bed of a stream to diminish the grade of the same and to decrease the power of the water; also to raise and thereby widen the bed, and to retain stone or detritus. A distinction is made between "dead and live thalsperren." The first are built of rock or timber, and the latter of hurdle-work and fascines made of green branches. The latter have that advantage over the former, that their resisting power will increase from year to year, as the branches drive their roots into the river bottom, and the growing twigs oppose greater obstacles to the water. The thalsperren of rock are either curved or straight. They can be built of dry masonry, or of masonry in mortar, or both. Wooden thalsperren should be used only where stone or rock cannot be obtained economically.

If a series of thalsperren has been built so that the line connecting the foot of the upper one with the top of the lower one corresponds to the profile of the equilibrium, *i. e.*, the grade on which the water is not able to carry away any more detritus, then it is evident that the detritus carried by the torrent will lodge above the thalsperren. If these thalsperren are sufficiently high and the river-bed has been widened by the deposits, and the water is compelled to run in the center of the thalweg away from the shores, then the problem of the permanent improvement of the torrent is solved.

But as the grades of the torrents are generally very steep, the distance between two such thalsperren would be very short, and the number of thalsperren necessary to arrive at the desired result very great, which would involve a heavy expense. Therefore, all what can be accomplished is to create the profile of equalization, and then construct such other additional works, which will prevent the erosion of the deposits and the undermining of the shores.

Such works consist generally of strong hurdles erected lengthwise equidistant from the center line of the thalweg, or the future river-bed, and of cross-hurdles placed at regular distances, forming steps, the upper edges of which lie in the line of equalization. To prevent undermining of the cross-hurdles, they should not exceed 1.5′ in hight, and the toes should be protected by rocks. The brush in the hurdles soon takes root and sprouts, thereby securing the river-bed and breaking the power of the high water. The space between the longitudinal hurdles and the shores must be filled with earth and be planted with willows set in rows under an angle of 45° with the center line of the torrent. Finally trees, driving strong and deep roots, should be planted.

Where stone is abundant, the hurdles are replaced by small thalsperren (2 3′ high) of dry masonry (rustic-thalsperren).

The works so far outlined have been employed successfully in France; they, however, refer principally to that class of mountain streams which derive their detritus solely by undermining the shores and eroding their own bed.

The other class of mountain streams, which receive their detritus from large accumulations of rocks, formed by the disintegration of the mountains or by glacial action, require additional works to neutralize the damaging influences of the continuous supply of material. These consist in the retention of the same near its source, or if this is not possible, in its storage near the foot of the mountains. The remedy in the first case is a restraining dam, a large thalsperre (in contradistinction to this kind, the previously mentioned thalsperren are called "consolidation-thalsperren,") built up in the mountains, or in the second case, a storage reservoir for the detritus on the talus of the torrent or at some other convenient place. As the restraining dams are built for the purpose to store as much detritus as possible, it is important that they should be built below places with gentle grades and of large lateral extent. They must be constructed so that they can be raised from time to time, by either putting a new section upon the thalsperre continuing the same slope, or by building a new one a little back of it. This latter method has the advantage that by the succession of steps the power of the falling water is broken; also that in case of injury or break of one of the steps the whole work is not endangered. The above mentioned storage places have the purpose to receive all the detritus not restrained by the upper thalsperrs. They consist of dams or levees, enclosing a larger or smaller area, with a waste-gate at the lower end, through which the clear water runs off. When the place is filled with detritus, trees are planted and another storage place is prepared.

The Ossslitzen thalsperre is the most important one in the district of the river Gail in Austria, and is represented in the figures, which are self-explanatory. The apron, made only of loose rocks, was soon carried away, but was replaced in the same manner, which will be continued until the bedrock is reached.

This thalsperre will store 42,000 cubic yards of detritus. It was built in 1877. In 1881 it was entirely filled up, an average quantity of 10,500 cubic yards having been deposited annually. This equally distributed over its watershed gives a wash of but 1·64″ per year.

Mine Pointers.

Ornamental gentry at high salaries may be of use to non-resident directors who put them at the mine, but nine cases out of ten they are a positive detriment to a mine. They absorb money that would be better spent in paying for labor on the works. The fewer pairs of smooth white hands there are around a mine, the better, as a general proposition.

Yea, verily, I say unto you, he that sticketh to his mine will be a bonanza king, but he that sitteth around on candle boxes and beer kegs will make a failure of it.—*Idaho Springs Gazette.*

A mere statement of assays does not prove much to an intended purchaser, but the result of mill-runs means a good deal.

A sale of a mine at a fabulous price far beyond what its real value is known to be by "insiders" instead of being a good thing for a camp is more likely to be bad for it in the long run. When purchased under such conditions there is sure to be disappointment and a consequent bad name for the district.

Mining purchases by capitalists are not always based on good business judgment. Few men can look calmly upon ore treasures in bulk and maintain their composure after they are offered an interest, whole or partial, on terms they consider favorable to themselves, and this is the direct cause of failure in mining investments; or at least this has been the case in the past.

Because a man strikes a rich claim he need not think his future is made, and then sit down and wait for 20-dollar pieces to be poured into his pockets. People do not hold open other pockets and pour money in. The finding of the claim is only the first step and it requires energy and work to utilize the discovery. The successful miners are not those who sit around and tell how rich their claims are.

News has been received that work has been resumed in the Paradise Valley and Wild Goose mines at Spring City, and everything is going along as usual at the mines and mill. The miners and Superintendent McCurdy had a conference, discussed their differences and amicably adjusted them.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Central Idaho.

Some Big, Rich Silver Mines.

EDITORS PRESS:—The Lost River region, in east central Idaho, is exceedingly rich in metallic wealth. Silver, copper and lead abound in all the ranges in large true fissures. Some of these veins contain an appreciable quantity of gold; especially those that are heavy in iron. Nearly a dozen large mining districts have been organized in this region since four years ago. In the Blackburn district near Little Lost River there are some immense veins of lead-silver ores. These lodes all show splendid bodies of galena and carbonates, most of which is of good grade; while some of the cupriferous ores, like that at the Ingersoll mine, assay over a thousand ounces silver per ton. The Ingersoll ore is principally galena and carbonates—steel galena and gray carbonates, with some black copper containing ruby and native silver. The vein is a large contact fissure between gray and black quartzite, of the potsdam period. The gangue of the Ingersoll is quartz; the vein stands vertical and shows a solid outcrop of good ore for 1,200 feet. There are close to 1,500 tons of ore on the dump, and many thousand in sight. The Ingersoll is the richest extension on the Tyndall lode. The mine will be developed this season.

Another extension on the Tyndall, known as the Daisy Black, is a bonanza. The D. B. shows many thousand tons of galena and carbonates most of which is good in silver. The whole of the famous Tyndall lode is in a quartzite formation. The vein is about five miles in length. The Alice extension, Great Northern Combination, Silver Queen and Dixie are all showing fair ore. Other extensions on the great lode show very favorable indications for subterranean bonanzas.

The Blackburn district is a new camp and its known mines all show standard geological evidence of proving a great and rich mining district. All that is needed is labor and enough capital to put in some mining machinery, concentrators and smelters. After that is done a vast amount of rich bullion will flow from this region. The Tyndall lode is evidently a Comstock No. 2, not a milling ore, but "a great zone of smelting ore" that can be easily treated and cheaply smelted. If such a showing were in Virginia City, Nevada, I can almost imagine that you would or could almost hear the miners away down in San Francisco. I know they would make a noise, and there is enough to justify a noise, a thunder and lightning clamoring, clattering racket, if you like. The best thing for the old Comstockers to do, if they have really exhausted the famous old bonanza, is to try elsewhere. I think there are greater and richer mines than the Comstock, and they will be found before another century.

Foolish Mining.

It is nonsense and foolishness to tunnel through mountains of barren granite when there are so many favorable looking outcrops showing on our mountains. That is why so much money is lost at mining. It really seems that some men expect to find mines whether there is any possible show for them to exist or not; in fact, where there is no possible show for them to exist. I know of many instances, but will just cite one here: "About 15 miles north of Salt Lake City, directly east of the town of Farmington, there are some deep cuts—holes in granite, genuine archæan granite—and this work was done by an Eastern company expecting to find "a big vein of coal." I know that practical mining men will smile at the idea, and well they may. Just think of it—coal in archæan granite! Such a thing was never known; in fact, it is a geological impossibility, for the very rudiments of geology prove it. Why do men search for coal in a formation that was formed millions of years before there was a bit of coal on the globe? But what is the use of trying to give knowledge to fools? Did they not burn Bruno to death because he taught the world is round and not a plane held upon pillars? Did not they keep the old astronomer Galileo in prison for many years for teaching the same doctrine? It really seems to me that there are many people in this world that have no desire to know the truth or any fear to believe a lie. For the salvation of humanity the time has come for science and reason to declare war against theology and modern superstition. Truth must ever be the criterion, even though the heavens fall. I am glad to know that liberal or scientific civilization is rapidly changing these many theological errors that are standing ghost-like, merely to frighten the innocent into mental slavery. There is altogether too much of this priestly blight here in Utah, and it is a shame that such traitors and polygamists are allowed such immoral liberty and protection or even toleration among honest men. What next? Well, kind reader, I beg your pardon for this digression. I will return to my subject and promise to leave it no more.

Central Idaho.

Just twenty miles east of the Blackburn mining district is the Oriental district. This district is in the eastern portion of Alturas county, and contains some large lead silver mines, prominent among which may be mentioned the Blackburn and Solfatara. These are immense galena carbonate veins, situated in a pronounced igneous formation—or rather in quartzite among dykes of basaltic lava. The Blackburn mine shows an outcrop of galena, carbonate ore from 5 to 40 feet wide, and this for a distance of 800 feet. The property will be extensively developed this season. There is already over a thousand tons of ore out, among which may be observed some big chunks of almost pure galena—going 80 per cent lead. The Solfatara is a great spur breaking squarely from the center of the Blackburn mine, and striking out at right angles to the latter. The Soltafara dips directly into a basaltic lava butte, and the indications are strong for a vast ore body under this ground. The Blackburn mine shows a variety of good heavy ore—some very fine crystalized carbonates. The wall-rock is "green with copper," and the lode contains clean, pure ore heavy in metal and free from gangue. These mines are only 6,000 feet above ocean level and can be cheaply worked. The great Snake-river lava fields come almost up to these mines. The flood is 60 miles wide and fully 600 miles long. This great outflow occurred during tertiary time. Then it happened this region was a little "warm."

The Blackburn and Solfatara are the most accessible mines in the Oriental District. Ore shipments will begin in June and continue all summer. About 20 miles north of the Blackburn is the great Viola mine, an immense vein of crystallized carbonate ore. The Viola can average more than a hundred tons daily the year round, and is producing all the time. Mr. Nichols, the superintendent, is doing good work, and his management is very creditable. About 12 miles westerly from the Viola is the Texas and Spring Mountain districts containing many veins of lead-silver ore, several of which will produce and ship ore this season, among which I can mention the Latest Out, Mammoth, Jumbo, Big Windy and Alleghany and some other prospects.

Big Lost River.

The mines on Big Lost river are copper, lead and silver—rich in all these metals. New mines are being discovered daily. The Big Copper, near Houston, is a second Anaconda. Big? yes, big! lots of it! immense! Heavy in copper and fair in silver. The Mammoth, near the Big Copper, is another good property. Many others in this region are good, rich and valuable. On Lava creek, a few miles south of this copper belt, are some big rich veins of milling silver ores.

The Horn Silver is a rich mine; several tons of this ore sampled over 800 ounces silver per ton. After a personal examination of this region, the geology, its mines, its mountains, the writer is constrained to say it is a new and important field, vast in mining resources and almost inexhaustible in metallic wealth. This country is now opening up; the grizzly must retreat. The *genus homo*, the genius of this age, is now on the ground. The time has come for Idaho to make her how and commence action. You will see good results.

COSMOPOLITE.

Oregon Mining Interests.

The mining interests of Baker county are just now assuming considerable prominence, and from the different discoveries being made on every hand and the reliability of the persons into whose possession they have fallen, the signs point to a new era in mining in this county and throughout Eastern Oregon. The decline of mining properties in other States and the Territories have sent mining capitalists and prospectors in quest of new fields for investment and work, and as this county in the past and more extensively at present presents that field they have sought for, no wonder they are turning their heads Eastern-Oregonward, where positive assurances are given them that capital invested in the mineral resources of this section is attended with that degree of safety that inspires confidence in all operators. The days of "wildcat" speculations are past, and realizing this the average mining capitalist is entertaining more safety in his investments. The people of this section have no desire to "shoe-string" the mining man who enters our boundaries for legitimate investment of his capital. This swindling business need not be feared at all. Within our county lines have already been discovered, and new revelations are coming to light every day, more legitimate paying quartz leads and offering better inducements for investment than any section in the northwest. Our gravel deposits, too, have only been partially explored, as evidenced every spring by the opening up of new ground, and the increased output of the gold product. We feel safe in saying that within the eye's reach of Baker City alone thousands of gulches will eventually be found to pay good wages to those who have the energy to bestir themselves and work them. To this end we need rustling mining men to take hold of the inducements and prospects offered, and we have no fear but that the result will be alike remunerative to them and to the whole county.—*Bedrock Democrat.*

A reduction of 50 cents per day has been made in the wages of the employes at the Navajo mine, Tuscarora. The reduction is general, with the exception of the Burleigh drillmen, who are paid at the old rate of $4 per day.

Get Your Ground Patented.

There are a great many mining claims in our three districts which have had all the work prosecuted on them and more than is necessary to obtain a patent. The title to these claims, in all cases, must be renewed from year to year, in order to keep it perfect and prevent relocations by other individuals. There are cases where prospectors continue to dwell on and work their claims steadily from year to year, and do much more than the necessary amount of work for the annual assessments. This is all well enough and not objectionable, but suppose some man comes along and is favorably impressed with the claim and is willing to pay the price asked for it, how is the owner going to guarantee a perfect title to the purchaser? The man of money will not be foolish enough to take the prospector's word for a title, and neither will he purchase unless he knows the title is bona fide. And, again. Suppose the miner suddenly comes upon a large body of ore and has no title only that which he has acquired by possession and actual work, how will he be able to keep blackmailers from trespassing upon his ground, and how can he avoid an expensive law suit? We all know that blackmailers are always on the alert—parasites, preying upon honest toil and hard labor. No man can guard his dumps so closely as to prevent everybody from knowing the nature of the ground in which he is working. A prospector may hide away in his underground workings the bunches of ore he comes upon before reaching the vein or greater body, but his dump will tell on him in spite of all he can do to prevent it. In a great many instances locks and keys do not accomplish anything. Every year the prospector's claim is watched by jumpers, who claim the right to relocate if the annual assessment is not done at the required time, and the law protects them. If a man locates a dozen or more claims in a good district and does not prosecute his annual assessment work as required, the law gives some other miner or prospector a chance. If a man expends large sums upon claims and is confident, or knows by the formation, that he has valuable ground, it is his duty to get it patented: and when he secures his title from the Government it is secure from all blackmailers or blackmailing schemes. It looks unjust and cruel for a man to be robbed of his mining claim after expending large sums of money upon it, but our law makers have said that assessment work must be done annually in order that the owner may keep in possession of his claim. It makes no difference what business matters call him away unless he leaves his claims properly guarded, when he returns he is liable to find some one in possession. The absence of tools, or any other sign of abandonment is grasped with avidity by mine jumpers, and the only safe way is a United States patent. When the miner obtains one, then he feels secure. Business may call him away for two or more years, and when he returns it will be found as he left it. It is necessary to have your claims patented and that just as soon as possible. It is the only safe way to conduct the mining business, and when a purchaser comes along you can present your bona fide title from the Government, and you sell at a good margin without any danger of lawsuits.—*Park Record.*

TEMPERING MINING PICKS.—There is probably no service to which steel can be put which so effectually tests its value as in mining picks. The tempering of a pick is a very nice piece of work and should be done with great care. In the first place a good charcoal fire is necessary; next, good steel, and then a good light hammer with a smooth-face anvil; and lastly a man is needed with a good keen eye, considerable experience and excellent judgment. No good pick can be turned out if any of the above essentials are wanting in the process. A pick should never be "upset," or hammered endwise, nor raised above a full red heat. The steel should be, moreover, heated as quickly as possible, as long exposure to heat—even if the heat is not in excess—injures its texture. Many blacksmiths find great difficulty in tempering picks, because they do not choose good steel. After being heated the pick must be worked with care, special pains being taken in drawing it out, to hammer on all sides alike, in one place as much as another, and on one side as much as the other. When ready for hardening, it should be heated in the blaze of a charcoal fire until red hot, and then plunged into cold rain-water, and kept there until it is nearly cold; but if kept too long in the water or until it is quite cold the corners are liable to fall off. Some blacksmiths use hot water; no salts of any kind should exist in the water, but the water should be cold; if the water is warm and a little ice should be thrown in to chill it, the tempering will be all the better. Pure soft water for hardening will make a tougher pick, and one less liable to crack at the edges than where salt water is used. The last hammering of a pick should always be given on the flat sides, across close to the edges and then up each side about an inch. By so doing the corners will be less liable to crack off.

It is stated that J. B. Hunt has sold his big 80-acre placer claim on the banks of Snake river to New York parties for $150,000. This is one of the flour-gold gravel claims some 30 miles west of Shoshone.

A Discovery Must Precede a Location.

The case of Upton vs. Larkin, recently decided by the Supreme Court of Montana, furnishes a fresh illustration of the losses that result from this carelessness of mine claimants.

A location was made with the discovery shaft sunk on the patented claim of another person.

The lawyers, in arguing for the validity of this claim on the ground of the lode having been found in the proper lines of the location after the error of the original discovery, relied upon an instruction of Judge Sawyer, in another case, in these words: "If a party should make a location in all other respects regular, and in accordance with the laws and the rules, regulations and customs in force at the place at the time, upon a supposed vein, before discovering the true vein or lode, and should do sufficient work to hold the claim, and after such location should discover the vein or lode within the limits of the claim located, before any other party had acquired any rights therein from the date of his discovery, his claim would be good to the limits of his claim, and the location valid." But Chief Justice Wade, of Montana, decided that "this instruction, if it is the law, would be applicable to a case where a person enters upon the public mineral land and discovers what he supposes to be a vein or lode and makes a location by virtue of such discovery before he has discovered the true vein or lode, and subsequently, and before any other person has acquired any rights, makes such discovery. Such a case would differ in many respects from the one under consideration. In this case, the appellants, without any right or authority, and as mere trespassers, entered upon the Shannon mining claim, which had been patented and was held and owned as private property. * * * and sunk a shaft within the boundaries of such claim. * * * The question is whether such a location becomes valid by the subsequent discovery of a vein or lode within the limits of the claim located." It is decided emphatically that it would not. "The statute does not permit a location and then a discovery, but in all cases the discovery must precede the location. We cannot do away with the express language of the statute and hold that there may be a valid location of a mining claim before there has been a discovery on the claim located. And especially we cannot maintain a location made by virtue of a shaft sunk on the patented claim of another person. If, subsequently to the location of the Camanche claim, a discovery was made thereon, then was the time to have made a valid location of the claim.

Antimony Mines.

The antimony mines which are being developed by the citizens of Los Angeles are thus mentioned in the Ventura *Free Press:* The antimony mines, situated about 60 miles from Ventura, in Ventura county, are being worked at the present time with considerable success. They are on the north slope of the San Emidia mountain five miles from the summit. Our informant, who has just visited the spot, says a mill is in the course of construction and will soon be in working order. The mill is located in San Emidia canyon, and about two miles from the mines. The trail is steep and zigzag, but when reached there seems to be a mountain of ore represented by short tunnels at different levels, and showing ore everywhere. In some parts of the mine the ore assays 150 ounces of silver per ton. About this mine hangs a mystery that nothing but the future can reveal. It has been rumored for many years that somewhere in the San Emidia mountains is an old mine worked by the Mission Fathers, but its whereabouts has been so completely concealed that it has never been rediscovered. A Santa Barbara gentleman told our informant that a relative of his as far back as 1854 went into the mountains with a party of men, accompanied by an old Indian who was to take them to the lost mine which was reported very rich, but after many adventures the search proved a failure. It is not unlikely that this antimony mine was worked by the early Fathers.

THE NEW RIVER ROUTE.—We notice that correspondents writing to papers below from Weaverville are endeavoring to boom up the route to New River from that place, promising to subscribe quite largely toward building a pack trail. The route from this county is over an old trail of early days, costing only $70 to improve by cutting out the brush grown, and has been traveled for two months past by parties desiring to visit the new Eldorado, and also by pack trains in furnishing supplies in the way of farm products and general merchandise.—*Yreka Journal.*

CUSTOM ORE.—Superintendent Clark of the Moulton company says that at no time since the Moulton mill was built has there been such an abundance of ore offered for custom treatment. The Moulton ore house is full, and still it rolls in faster than the stamps can crush it. The prospects north and east of Walkerville are all showing up finely, and producing more or less of high-grade ore. The coming season promises to be marked by an unusual production of ore from hitherto unworked prospects.—*Butte Inter-Mountain.*

MECHANICAL PROGRESS.

Economy in the Use of High-Pressure Steam.

The importance of the use of high-pressure steam, says W. B. Van, in a paper read before the Franklin Institute, Feb. 18, 1885, cannot be too constantly urged upon engineers and manufacturers, and that the employment of low-pressure engines is extremely wasteful; yet clear as this is or should be to all intelligent engineers and steam users, they do not seem to recognize the truth. One may often hear an engineer boasting "I have got an extremely good engine; she is the boss and will drive the whole load with forty pounds of steam," never reflecting that, when he is using steam at only forty pounds above atmospheric pressure, in a non-condensing (high-pressure) engine, one-third of all the fuel is consumed in getting the steam up to atmospheric pressure; while if he were to use the steam at 125 pounds, only one-ninth of the fuel would be so wasted.

But few engineers stop to reflect that when they are using non-condensing engines at low pressure the loss is great, owing to the pressure of the atmosphere (about 15 pounds) being a greater percentage if a low instead of a high pressure is used.

The secret of economy in running steam-engines is chiefly due to the adoption of the highest practical pressure of steam through jacketing about the steam pipes, cylinders and steam chests, and in employing the earliest cut-off at which the engine will do its work, and as perfect a condensation of steam as possible after the engine has done that work.

"It has been proven both in practice and theory that the greater the difference between the steam pressure on the piston and the resisting forces of the condenser or atmosphere, the higher will be the mechanical efficiency of the steam—hence the necessity of employing high-pressure steam in order to obtain the fullest effect of expansion."

"In the boiler the test of economy is the quantity of water evaporated into dry steam for each pound of coal burned. If this quantity be above eight pounds, the boiler is economical, and ten pounds is the maximum realized in the best boilers. Apart from the evaporative power of the boiler, its cost, durability and convenience for repairs are important considerations, and demand due attention."

* * * * * * *

Superheated Steam.

For some time past engineers have abandoned superheating, although its value is well understood, but this has been from the want of proper packing and lubricants. In the present advanced state of the arts the above objection to its use can now be overcome.

The advantages to be gained in the use of superheated steam cannot be over-estimated. The use of wet steam augments cylinder condensation, whereas by the use of superheated steam cylinder condensation will be reduced to a minimum, from the fact that the latter conducts heat very slowly.

[We would introduce in this connection the following item from a late number of the *London Engineer*, which says: "It seems a little remarkable that in the pursuit of economy engineers have abandoned superheating. Years ago its value was well understood, and the superheater was found in almost all ships pretending to have good engines and boilers. The conditions under which superheating can be employed are now much more favorable than they used to be. Asbestos and metallic packings are now available, which were unknown before, and mineral oils can be used as lubricants instead of the tallow, which alone was at the service of the engineer as a cylinder greaser. If we assume that 350 degrees is a safe temperature, then it follows that steam of 85 pounds with a temperature of 328 degrees might have 25 degrees or thereabouts of superheat imparted to it without the least danger. Indeed, a greater degree of superheat would do no harm, because the steam is certain to be cooled down the moment it enters a cylinder. A superheater will send dry steam into the engine, and not a mixture of steam and water. Another advantage is that superheat will tend to prevent cylinder condensation."—EDS. PRESS.]

Priming.

The worst defect a boiler can have is a disposition to prime; in other words to send water as well as steam to the engine. Whether a boiler primes much or little, the defect is serious. Priming is in conventional terms nothing more than a boiling over. The steam as it is generated, instead of escaping freely from the water, is entangled with it, and carries over in its grasp a certain portion of the fluid.

PROFITS OF GERMAN IRON-WORKS.—Some interesting facts have lately been collected by the German Ironmasters' Association concerning the financial results of the working of 102 companies engaged in the iron-making and machine-construction industries in each of the years 1879 and 1883. In the former year the net result of the operations of these companies was a profit of 1.6 per cent on the capital invested; whereas in 1883 the net profits on the same concerns amounted to 6.79 per cent on the invested capital. This shows a gain of 5.19 per cent. This gain in 1883 is all the more remarkable when examined in reference to the iron-working concerns alone, leaving out the machine-construction industries. It appears from the statistics that 50 of the latter companies, with a total capital of 268,764,000 marks, realized only sufficient in 1879 to pay an average dividend of 0.94 per cent., whereas in 1883 the profits earned allowed of an average dividend of 6.14 per cent being paid, the net profits amounting to 16,500,000 marks in the latter year, against rather over 2,500,000 marks in 1879.

Electricity in Mechanics.

Electricity is rapidly working its way into general uses. The latest addition to its uses is that of

The Working of Cranes.

A 20-ton foundry crane, says the *Electrical Review*, is operated by electricity at the works of M. Farcot, at St. Ouen, France, the crane having previously been worked by hand. The generating dynamo is at a distance of about 100 yards from the crane. At the speed of 1,550 revolutions per minute it produces a current of 13 amperes and about 350 volts. The secondary dynamo is fixed upon the crane itself, and makes 1,000 revolutions per minute, developing about four-horse power. The crane gearing itself has not been altered, and the electric machinery has been so fixed that the crane can also be worked by hand when the steam-engine is stopped. A special rheostat allows progressively-increasing resistances to be introduced up to 60 ohms, by means of which the lifting speed of the crane can be varied. A Megy brake, acting by centrifugal force, assures safety in case of accidental derangement of the machinery. When drawing large castings out of the sand, a vacuum is produced under them at the moment they begin to be lifted which may result in a very considerable increase of the load by the atmospheric pressure acting on the surface of the casting. To prevent accidents from this cause or other overloading of the crane, an arrangement has been introduced by which the circuit is interrupted when the load exceeds the prescribed limit, and, of course, the crane comes to a standstill. The crane, which can lift 20 tons, now requires only the attendance of one man, while formerly ten laborers were required to work it.

The Use of Electricity for Making Steam.

Should it ever be found practicable to generate electricity direct from the combustion of coal, says the *American Machinist*, the steam-engine would soon disappear; but till the inventions are perfected that will render the existing expensive methods of producing electricity no longer necessary, there seem to be small prospects of the dynamo supereeding the steam-engine as a motor to any remarkable extent. In connection with the struggle to improve on existing methods of obtaining power, a recent invention, patented by parties in California, is of curious interest. They do not attempt the Edison feat of making electricity direct from coal without the intervention of a steam boiler, but they propose to make steam by electricity. They propose to seal hermetically the flues of a boiler after having filled each with a coil of platinum wire, which will be in connection with a dynamo. The dynamo sends a current of electricity through the wires, which are arranged to make enough resistance to transform the electricity into heat. That, of course, will make the water boil and generate steam. It is not reported whether or not the inventors expect to make this steam drive the dynamo, and so keep the cycle going, but we fancy this is the expectation. The trouble with the application of electricity is that its ignorant friends are trying to use electricity for purposes it is conspicuously unfitted for.

MEND YOUR FILES.—Once in a while a file will get broken, even with the best of care; but, with the knocking about they are subject to, it is a mystery how any of them come out whole. Take a file the very minute you break it. Have a little bottle of muriate of zinc (zinc dissolved in muriatic acid), and wet the break with it immediately; then heat a soldering iron and tin the ends of the file. Heat the file pretty warm—not enough to start the temper, but rather too hot to hold in the hand. When well tinned and hot, press the two pieces firmly together, squeeze out nearly all the solder, and let the file cool. Trim off the joint, and, if well done, the file will break in another place next time. It will not pay to solder a file unless it is nearly new. If you let it lay a day, or, in damp weather, even an hour, after being broken, you never can mend it so it will stay. Take it the minute it snaps, and you can mend it.

PRIZE OFFERED FOR AN INVENTION.—At the third international conference of the societies of the Red Cross, held in September last, at Geneva, the Empress of Germany offered $1,000 and a gold medal as a prize for the best model of a soldier's barracks and field hospital. The delegates to the conference from this country have issued a request to American inventors to take part in the contest. The barracks must be large enough to contain twelve to fifteen. It must be easy of transportation and made with interchangeable parts and capable of being taken down and reconstructed. The designs are to be sent to Antwerp, Belgium, by Sept. 1, 1885, when a committee will decide on their respective merits.

SCIENTIFIC PROGRESS.

Bronze Statues.

Bronze statues were made two, and perhaps three thousand years ago, the earliest consisting of small plates hammered into the desired shape and fastened together by nails or rivets. After this they were cast solid and also with a core. At the present time it is the general custom to divide the statue, when of heroic size, into several sections, make a separate casting of each section, and then unite the parts by riveting, the joint so formed, owing to the increased thickness of the metal, being of greater strength than the adjoining parts.

It would be a most difficult task, says the *Scientific American*, to mention and separately describe each and every step which must be carefully quoted by the operator in casting bronze, in order that the resulting copy may be a *fac simile* of the original. Extended practice enables the founder to note all these features without necessarily appearing to devote more attention to one than another. In a certain sense the work, from the melting of the medal to the final flowing, pursues a beaten path along which are distributed certain guide marks, the absence or even the unusual appearance of any one of which quickly gives notice that all is not as it should be. It is here that we find the most apt illustration of the value of little things, since the most trivial neglect of a seemingly insignificant portion of the work may not only injure, but destroy the casting.

Casting in bronze does not consist solely in simply taking a pattern, making a mold and running in the metal; it is an art only to be acquired by long and patient toil, close study, and that most essential and spurring incentive, a fascination for the work. That success can only be achieved by this means will be understood by any one who will spend an hour in a bronze foundry and note the time and care spent in making sure that one step is perfected before the next is even approached. There is no sign of the presence of that most pernicious habit, too frequently permitted in other callings, in which a distasteful part may be slurred or left half finished, and a rush made for something more agreeable. The bitter and the sweet must receive the same attention, as both are equally dangerous when slighted.

One requisite qualification in the make-up of the bronze founder is an ability to obey orders. He receives from the sculptor a model in plaster which he is expected to reproduce in bronze; if he produces an exact counterpart, he has performed his whole duty and has strictly abided by his orders, which may be concisely expressed as "follow copy." It does not come within his province to attempt to improve upon the pattern set before him, but to reproduce it, whether full of blemishes or perfect. The artist does not expect him to improve his work.

DEVIATIONS OF THE PENDULUM IN MEXICO.—During the stay of the French Commission at Fort Loreto, in Puebla, M. Bouquet de la Grye installed in the chapel of the fort a seismograph composed of a pendulum and a multiplying balance. After freeing the observations from abnormal movements he found that the sun repelled the pendulum in the morning and evening, but at midday its influence was attractive. The vaults of the chapel, which ran from southwest to northeast, being heated at morning and evening, thrust the pendulum in a direction opposite to that of the sun; in the middle of the day the influence was reversed. In grouping the observations under lunar hours the pendulum was found to be attracted by the moon. The seismograph showed that there were frequent abnormal movements of the pendulum, there being twenty-two oscillations of the ground. The mean movements were in the direction of northwest, southeast, which is the same as that of the chain of the volcano Popocatapetl. While the oscillations were going on the inhabitants of Puebla felt but a single earthquake shock. It would be interesting to extend these observations by registering the movements of a long pendulum for a considerable period in an observatory; they would furnish valuable data respecting the movement of the earth's crust and the tidal phenomena.—*Comptes Rendus.*

ELEMENTS OF SOLAR ROTATION.—Sporer has tested his own observations by means of the result which was pointed out by Faye, that the proper movement of the sun spots in latitude can be represented by a sinusoid. The direction of the spots in the equatorial regions mainly toward the equator, while the movement toward the poles predominates in high latitudes, might be explained by supposing that the spots in the former case were on the descending branch, and in the latter on the ascending branch of the curve. This would require, however, that the spots should be hidden, for some unknown reason, behind the sun's disc when they were on the other branches of the curve. He gives various other tests, under various hypotheses, each of which involves an indeterminate condition. There was, however, one spot which remained visible during four consecutive rotations of the sun, and for which he was able completely to observe the sinusoid of the variations in latitude in all the periods. He was able to determine the sinusoid, independently of the node and of the declination, by means of the intersection of the curves with the parallels of latitude which he obtained for the first and second, as well as for the second and third periods. The sinusoid thus deduced for the three periods also satisfied the observations of the fourth.—*Comtes Rendus.*

COMPOUNDS FORMED BY CHLOROPHYL.—Chlorophyl when isolated is very soluble in alcohol as well as in benzole or in petroleum ether, but merely a mixture of yellow or colorless matters. Hence it seems that the chlorophyl is contained in envelopes insoluble in petroleum ether, but soluble in alcohol. The deep green alcohol extract of dried and powdered leaves, if refrigerated, yields an abundant deposit of yellowish or colorless matter insoluble in petroleum ether. Chlorophyl is very unstable in presence of dilute acids, or even of pure water. It is very stable in presence of bases, behaving like a true acid. Hence M. Fremy gave the name of phyllocianic acid to the green matter of leaves when freed from the accompanying yellow matters. With bases it forms definite salts; those of potassium and sodium being very soluble in water, but insoluble in absolute alcohol and in petroleum ether. The lead salt is insoluble. Chlorophyl may be found unchanged in the excretions of herbivorous animals, and even in peat.

PLANT MIGRATIONS.—Fifteen years ago there were no dandelions in central Iowa, now they are very abundant, and have been for half a dozen years. Then there were no mulleins, now there are a few. Then the low and evil-smelling *Dysodia chrysanthemoides* grew by the roadside in great abundance, now it is scarcely to be found and is replaced by the introduced "dog-fennel." Then the small fleabane (*Erigeron divaricatum*) abounded on dry soils, now it is rapidly disappearing. Then no squirrel-tail grass grew there, now it is very abundant, and has been for ten years. Then there was no hurgrass in the flora, now it is frequently found, and appears to be rapidly increasing. Both of these grasses have apparently come in from the west and northwest. Fifteen years ago the low amaranth was rather rarely found, now it is abundant and has migrated 150 miles northeastward. This plant has certainly come into the flora from the southwest within the last twenty years.

ANIMAL BAROMETERS.—There are two live barometers in Sacramento, so it is said, that have proved trustworthy, even where artificial instruments have failed. One of them is a catfish, which is kept in a water trough. No matter how clear the weather may be, this fish always, before a storm, makes it a point to swim about with his head below the water and his tail above. When the rain begins to fall he goes out of sight until the weather changes. The other is a couple of frogs under the floor of the police office, which have never yet been seen by any of the police officers, but who presage a storm several hours in advance of the barometrical indications by a series of peculiarly discordant croaks. No matter how clear and bright the night, the police officers then make it a point to prepare for a storm, and the warning has never proved in vain.

FORESTS AND TEMPERATURE.—As a result of his forest meteorological investigation Prof. Muttrich, of Berlin, has arrived at these definite conclusions: 1. The forest exercised a positive influence on the temperature of the air. 2. The daily variations of temperature were lessened by the forest, and in summer more than winter. 3. The influence of the leafy forest was in summer greater than that of the pine forest, while in winter the tempering influence of the pine forest preponderated over that of the defoliated forest. An attempt to determine the influence of the forest on the mean annual temperature led to no sure results.

SOIL covered with living herbage or with such dead vegetable matter as leaves, straw wood, dung, etc., says Prof. E. Wollny, is warmer in winter and cooler in summer than bare soil under similar conditions. The difference of temperature is greatest in summer and least in spring and autumn. Bare soil heats more quickly in spring and cools more quickly in autumn than that covered with living or dead vegetable matter. The fluctuations of temperature are much smaller in covered than in bare soil.

LIGHT CLOUDS OF THE UPPER ATMOSPHERE.—A. Badoureau supposes that in the upper regions of the atmosphere the temperature may be reduced nearly to absolute zero, and although the temperature is correspondingly reduced, he thinks it probable that carbonic acid, nitrogen and oxygen may be there condensed into clouds analogous to those which are formed by watery vapor in the lower atmosphere.—*Comptes Rendus.*

ELECTRICAL FISHES.—There are at least a dozen species of fishes having electric organs. The electric eel of South American waters is the most powerful of these creatures, growing to a length of six feet and provided with a pair of batteries containing some hundreds of minute cells copiously supplied with nerves, which exhibit phenomena the same as those produced by artificial batteries.

MERCURY FLASKS hold about half a gallon and weigh about 12 pounds. They will stand 1,000 pounds pressure with safety.

TABLE OF CONTENTS.

EDITORIALS.—Improving Sediment Bearing Streams; Mine Pointers, 329. Passing Events; Locomotives; Copper; New Miners' Pick; Restoration of Gold Mining in California; Mines of New Mexico, 333. Manufactures of Soda, 334.

ILLUSTRATIONS.—"Thalsperre" for Retaining Debris; Details of Construction of Retaining Wall; Cross-Section of Thalsperre, 329. Fig. 1—Gerstenhofer Ammonia-Soda Plant, Ground Plan; Fig. 2—Longitudinal Vertical Section, 334.

CORRESPONDENCE.—Central Idaho, 330. New Mexico; The Malone District, N. M., 334.

MECHANICAL PROGRESS.—Economy in the Use of High-Pressure Steam; Profits of German Iron Works; Electricity in Mechanics; Mend Your Files; Prize Offered for an Invention, 331.

SCIENTIFIC PROGRESS.—Bronze Statues; Deviations of the Pendulum in Mexico; Elements of Solar Rotation; Compounds Formed by Chlorophyl; Plant Migrations; Animal Barometers; Forests and Temperature; Light Clouds of the Upper Atmosphere; Electrical Fishes; Mercury Flasks, 331.

ENGINEERING NOTES.—Compressed Air Power; The Cape Cod Canal; A Monster Steamer, 335.

USEFUL INFORMATION.—Rust Cement; Mother of-Pearl Designs on Tissues; Rolled Gold; A Fruitful Grain; Ancient Shields, 335.

GOOD HEALTH.—Healing by Faith; Hours for Sleep; Death Traps; Drowning not Painful; Disinfectants; Camphor and Cholera; Rain Water; The Magnet in Disease, 336.

MISCELLANEOUS.—Oregon Mining Interests; Get Your Ground Patented; A Discovery Must Precede a Location; Antimony Mines, 330.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 336-37.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 340.

Passing Events.

An encouraging sigu of the times is the fact that so many miuers are now working small claims themselves and putting them iu good shape, so that capital will take hold of them at the proper time. There are now so many places where miners can dispose of their ore or have it worked, that they are enahled to make more than expenses while developing their claims.

Another good thing is the spread of the leasing system, where miners have a personal interest in the ore they take out. Better work is done and an incentive is given which is better thau that afforded the mere wage-worker.

There is little uews from the mines of an exciting character. Our weekly summary, in other columus, gives all the enrrent news. Everywhere the men are at work, the prospectors are out in the hills, and the mills and smelters are in full blast.

The excelleut letters of our traveling representative, which describe the mines and mineral regions of New Mexico, are worthy of careful perusal, as a very good general idea may he gained from them of the condition of the miuing industry in that growing section.

FROM the pnhlished statistics, it is seen the coal trade of Great Britain for many years, with the exception of 1878, has heen one of continual progress, the average increase being something like 4,000,000 of tons per annum. The year 1884 was an exception to this, a decrease of upward of 3½ millions having taken place, as compared with 1883, which was the largest on record, being upward of 163,000,000 tons.

Locomotives.

The present American locomotive may he fairly considered an estahlished criterion of excellence. It is characterized hy accuracy and heanty of workmanship and strength, combined with flexihility and adaptahility to many difficult conditions of service—an adaptability which has given it the precedence where such conditions have to he met. Although the great demands of railroad traffic and travel in this country have ahsorbed the greater part of the product, American locomotives have been supplied to foreign countries using railroads in such numhers as to mske them an important factor in the extension of facilities of travel and communication ahroad.

The manufacture of locomotives in locomotive works is so far based upon the use of costly and partly finished materials that the additional lahor and expense involves lees than one-half the valuc of the fiual product. The iron and steel plates, steel tires, sheet hrass and iron, copper pipe, emoke and feed pipes, chilled wheels, holts, nuts, hardware, fittings, hoiler tuhes, flues and other materials, are in themselves costly products, and some of the forgings aud the steel and iron castings are often produced for the work by separate eetablishments having special facilities.

On the whole the raw material, properly speaking has its value more than trebled before it is brought into the locomotive works ae material for the manufacture. In comparing the manufacture of locomotives with the manufacture of small engines or of sewing machines, where the value of material in locomotive manufacture is doubled, in that of smallengines it is nearly trehled, and in sewing machines quadrupled; but in locomotive huilding the same movement of added value requires the employment of a considerably greater numher of artisans (at similar rates of wages) than are employed in the manufacture of small engines; principally because the prices of locomotives arc ruled hy the wholesale purchases of large railroad corporations, while the prices of small engines and machinery are ruled to a great degree by small buyers making single purchases.

In short, in the manufacture of locomotives the cost of pntting the product upon the market is reduced to a minimum, and of the same added value given in the manufactures and marketiugs about 50 per cent additional goes for the employment of artisans in locomotive-huilding, as compared with the general manufacture of steam-engines.

The composition hy weight of the various crude and finished material in a locomotive and tender weighing ahout 45 tone (net) may he stated as follows: Ahout 32 per cent pig-iron, 18 per cent bar and hammered iron, 9 per cent hoiler-iron and steel (ahout one-fifth of which is in the fire-hox), 8½ per cent steel tires, slides, springs and the like, 7 per cent wheels, 7 per cent wood for cah, tender and lagging, 5 per cent axles and connecting rods, 4 per cent flues, 3½ per cent tank iron, 2 per cent lead, tin, copper, smoke-pipe, glass, hardware and fittings, 1½ per cent bolts and nuts, 1½ cast and sheet brass, and 1 per cent sheet-iron.

Copper.

A very significaut fact in conuection with our copper interests is that the imports into England and France for the past four months have exceeded that of the same period in 1883 hy 9,355 tons, while the deliveries have decreased by 4,842 tons. Of the increased import 7,111 tons came from the United States, whereas last year stocks decreased 6,632 tons in the first four monthe in England; they have this year increased 7,568 tons in this period. The lower price of copper has influenced foreign mines as well as ours, of course. The effect of the low prices ruling for copper is seen in the reduced dividends of the three large Spanish mining companies, which are as follows: The Tharsie Company, 20% against 27½% for the year 1883; Mason and Barry, 8% against 12% for the year 1883; the Rio Tinto Company, 8% against 14% for the year 1883; the average price of har copper for 1884 heing £54 9s. 1d. per ton, against £63 5s. 10d. in 1883. The three companies shipped 615,920 tons of pyrites, against 639,009 tons in 1883. The Tharsis Company announce their intention of shipping 100,000 tous or 50 per cent more pyritee than last year, partly to compensate for the reduced value of the copper and the decline of 8s. per ton in the value of the sulphur contents. The Rio Tinto Company have also contracted for about 100,000 tons more than last year, while Messrs. Mason and Barry now ship all their copper produce in the form of precipitate. The Tharsis Company shipped 7,095 tons precipitate, against 6,717 tons in 1883, and the Rio Tinto produced altogether 12,668 tons (of 21 cwt.) fine copper, against 12,295 tons in 1883.

Last month Chili sent to England 3,606 tons of copper, while the United States sent 2,320 tons, and we also sent 1,685 tons of copper to France last month. For the first four months of the year Chili sent to England and France 31,824 tons of fine copper, against 36,666 tons in the same period last year. We sent to Liverpool and Swansea alone this year eo far 7,231 tons, as against 4,045 tons the first four months of last year.

Jamee Lewie & Son's circnlar of ores and metals (Liverpool) gives some interesting statistics for the first quarter of the year concerning copper. The imports into England for the quarter were 31,447 tons fine; the exports from England were 13,950 tons; British production, 524 tons; English home consumption, 13,845 tonr; imports of all kinds into France, 4,240 tons; English copper to France, 726 tons; French consumption of copper imported direct, 3,873 tons; English consumption and French consumption of copper imported direct and from England, 18,444 tons.

The Board of Trade returns show that America sent only 202 tons of regulus in the first quarter of last year, while this year we sent 3,206 tons of regulus. The English export of wrought and unwrought copper for the quarter was 9,084 tons (11,127 last year); yellow metal, 2,660; brass, 758 tons (1,011 last year); unwrought and part wrought (foreigu), 1,148 tons (3,049 last year). The Cornish mines only produced 524 tons of copper during the first quarter of the year.

New Miner's Pick.

James P. Davis and Juan G. Robbins, of Banner, Boise county, Idaho, have patented through the MINING AND SCIENTIFIC PRESS patent ageucy an improved form of miner's pick, so constructed that the head may he easily attached to, or detached from, the handle. Lugs are formed on the sides of the central portion of the head, so as to form dovetailed grooves or channels between them and the sides of the pick-head. At the end of the handle are two short metal straps, oue on each side, riveted on so as to project heyond the end of the handle. Upon the edges of the handle are fixed plates, having their ends just flush with the end of the pick-handle and of sufficient width to give a firm hearing against which the portion of the pick next the handle will rest when it is fixed in place. Through the head of the pick an opening is made transversely and similar openings are made through the straps on the end of the handle. When the pick-head has been elipped on hetween the straps, the edges of which are dovetailed to correspond with the grooves upon the opposite sides of the pick, it will rest upon the end plates, and the hole in the straps will coincide with the one through the head of the pick.

A key and gih are fitted into the holes in the strap and head, and when the key is driven in tight the pick will he held very firmly and rigidly to the handle. By this construction one handle may he nsed and any numher of picks of different weights may he fitted to it; also, other tools which can he ueed with snch a handle. Whenever a pick becomes dnll, it may he removed and another one put into the handle, and so on, and when several picks are ready to he eharpened they may he taken away to the blacksmith shop and sharpened and returned without carrying the handles with them.

The picks and handles all heing made interchangeahle, it will not matter what pick in particnlar a man may receive, it will always fit the handle which he has. When the picks are to he carried away or out of the mining shaft or place where they are used, they can he bnndled together in a comparatively small space and sent up in the bncket without much danger of having any of them hit some obstruction so as to knock them out. They are always very convenient for prospecting purposes, as a handle and pick can he packed up in small compass. When used in dry places there is no danger of the pick hecoming loose by the dryiug up and contractiou of the handle.

Restoration of Gold Mining in California.

We have frequently had occasion of late to speak of the improved condition and prospects of quartz mining in California. A feature of this improvement that deserves especial notice is the extent to which ore-hearing lodes of this kind are heing discovered all along the main gold helt and often in districts that hsd years ago heen densely populated and largely worked for the placer deposits they contained. Many of these districts, as in the case of New River, Washington and various other localities, had, hy reason of the surface diggings hecoming exhausted, been nearly deserted long ago, and so remained until a year or two since, when these new quartz finds gradually repopulated them, some containing now several thousand inhahitants.

But not in all cases have the sites of these new finds been confined to the dead or decaying camps. On the elopee of the Sierra Buttes, a notahle peak in the central part of Sierra county, and where quartz operatione have heen carried on actively and successfully for a great many years, a number of valuahle auriferous lodes have lately heen found, the most noted of these consisting of the Alaska, Phœnix, Colomho, Marguerite and the Young America, the latter onc a most promising gold-hearing vein. The Sierra Buttes mine, owned hy an English company, has heen worked continuously and profitahly for 29 years. To their 90 stamps now running this company will add 20 more in the course of another month. The Alaska, Colombo and Marguerite have each heen outfitted with a 20-stamp mill; a mill will also he put up on the Phœnix as eoon as the ditch to supply water-power is completed. The 10-stamp mill on the Young America will be increased to 20 the coming summer. The vien in this mine occurs in a belt of metamorphic slate lying at the line of contact between greenstone and syenite, which form the country. Embedded in thie helt and ruuning with it is a quartz lode having an average thickness of ten feet, which, from exteneive working tests made, it is expected will yield under the stamps $125 per ton; it heing, furthermore, calculated that 16,000 tons of this ore have been developed in the mine, whioh is owned hy three or four individuals, a once prominent Comstock superintendent having also an indirect interest in the property.

With such discoveries as these being made in much prospected and even long worked localities as well as in old aud once populous, but now partially deeerted districts, what may we not expect will yet he hrought to light in those extensive sections of the California gold fields that yet remain sparsely populated, and, comparatively speaking, have not heen much explored? The undeveloped, not to say undiscovered, auriferous resources of this State are undoubtedly very great—greater hy far than has generally heen eupposed, if not greater than the most sanguine have ever dreamed of. In view of this fact it is not at all etrange that gold mining is again coming to the front, nor would it be at all surprising if California should hefore the lapse of many years recover much of her lost prestige as a gold-producing country.

Mines of New Mexico.

Elsewhere in this issne is our traveliug representative's letters and notes on the Carlisle, Malone and other districts of Grant county, New Mexico. His observations ehow a decided improvement in mining and milling in the new as well as the old districts of that Territory. It is gratifying to note the intelligence shown and business-like methods exhihited day hy day as those who are engaged in the search of precions metals become more and more practical in the working of mines and less inclined to do their work on the stockhoard, as heretofore. Should the mining interests continue to improve in as legitimate a manner for a twelvemonth longer, we wonld not he surprised to find money loanere investing in mines in preference to real estate. The mines of New Mexico are bnt a few of those that are getting down to business; throughout the Coast the good work goes on, and ere long ore will have to be of a mighty low grade to defy handling at a profit. Next week our representative will give our readers a hudget of valnahle informaticn on the the copper mines of Graham connty, Arizona.

Manufacture of Soda.

Developments in England, and particularly on the continent of Europe, show that the new method of the manufacture of soda, namely, the ammonia process, is rapidly displacing the old. It is particularly advantageous to this country, where we have but one mine where rock-salt is mined, namely, at New Iberia, La., while there are many localities where brine of various degrees of strength up to that of cold saturation is obtained in large quantities. We have, moreover, plenty of fuel in close proximity to most of the mine centers. We have a constantly increasing demand for soda, which is almost entirely supplied by importation.

In 1875 of the total product of the world only 10.57 per cent was made by the ammonia process, while in 1883 23 per cent was made that way. This rapid increase must be credited to the enterprising firms of Brunner, Mond & Co., near Norwich, England, E. Solvay, at Couillet, Belgium, and Varangeville, Dombasle, France, all working according to the Solvay plan. The first increased their production to 52,000 in 1883 from 2,500 tons in 1875; the second, from 179 tons in 1867, to 4,678 in 1875 and to 65,125 in 1883.

During the last few years extensive experiments have been made, to furnish a new source of ammonia by utilizing the waste products from coke-ovens and iron-furnaces. These have already been crowned to some extent with success. Large coke-producers have erected plants to collect the ammonia at remunerative prices. Considering the very large amount of coke produced, it is evident that no fear need be entertained but that a constant supply of ammonia can be secured at reasonable rates from the above source. Ammonia-soda-works, which may be so favorably situated as to have their coal supplies near at hand (and such places are fortunately found, particularly in the United States, in close proximity to salt-brine), may even find it advantageous to produce their own ammonia and supply the waste at minimum cost.

While we are indebted to E. Solvay for having opened the path to success (the enormous increase of his personal manufacture in Europe, amounting to 179 tons in 1866, but 53,400 tons in 1882, being ample proof), other able practical chemists have entered the field also, so that we have now a variety of apparatus, described in foreign journals, as used in Europe to accomplish the same object. It is due to M. Solvay that the first manufacture of this kind has finally been erected in the United States, at Syracuse, N. Y.

These facts we take from a paper by Oswald J. Heinrich, of Drifton, Pa., read before the American Institute of Mining Engineers. To make clear the peculiar advantages of this process, Mr. Heinrich gives in Figs. 1 and 2 of the engraving a sketch of works designed to use the apparatus of M. Gerstenhoefer, patented in the United States May 3, 1881.

Fig. 1 represents the ground plan, its exterior dimensions being 218 by 50 feet, including a mill and packing-room at the lower end, not represented in the figure. Fig. 2 is a longitudinal section. The design represents one "block," which is the smallest works which can be put up to make the manufacture profitable. For larger works the blocks are grouped together, and by the centralization of the work expenditures in erection and general manage-

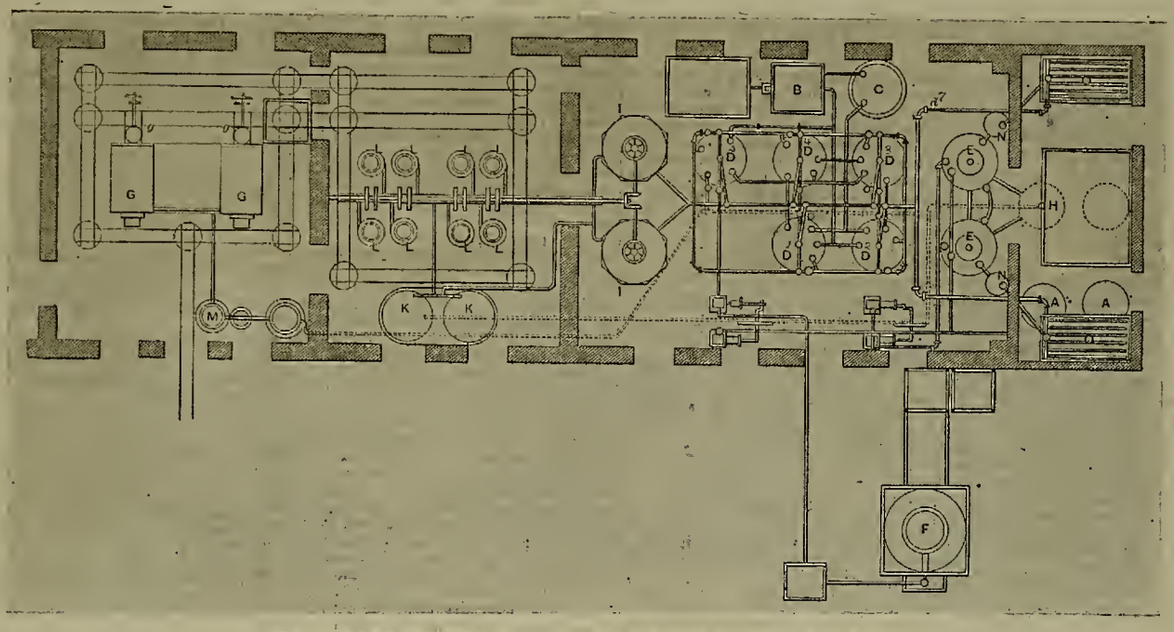

Fig. 1.—GERSTENHOFER AMMONIA-SODA PLANT, GROUND PLAN.

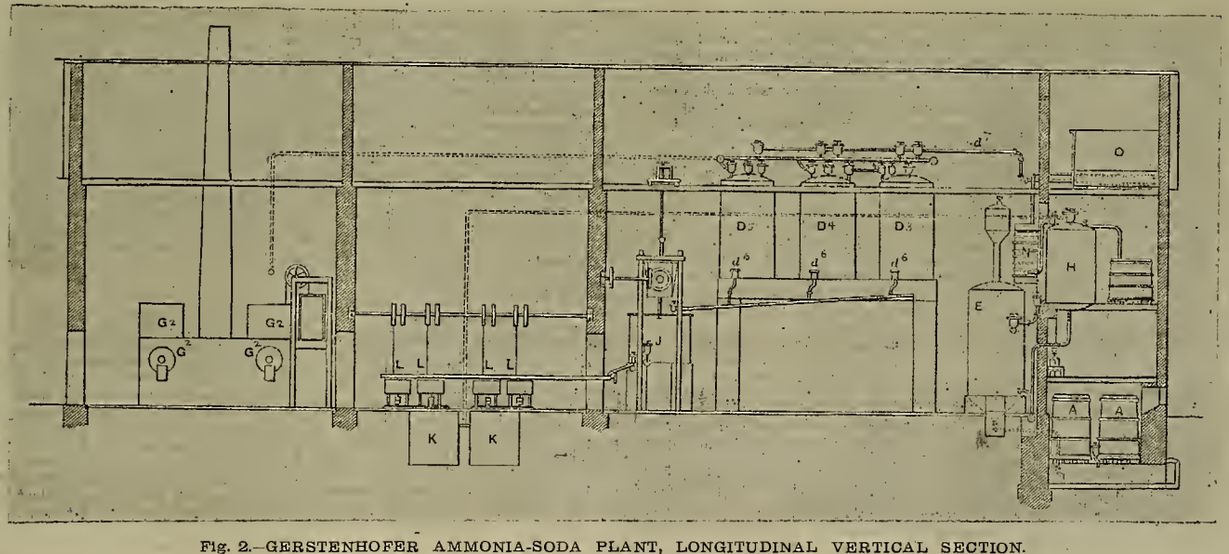

Fig. 2.—GERSTENHOFER AMMONIA-SODA PLANT, LONGITUDINAL VERTICAL SECTION.

ment will be reduced. One block is capable of producing eight and a quarter tons in twenty-four hours. A block consists of five separate departments. In the first we find the brine tank, A, from which the purified brine is forced over to a coke-tower, B, supplied with a shower apparatus. The wasted ammonia gas, if any should leave the next apparatus, passing upward in this tower, is absorbed entirely by the descending brine. The latter is collected in a reservoir, C, and pumped into the universal apparatus, D, for conversion into bicarbonate of soda. Five of them are used in rotation, as described below. Each consists of an air-tight cylindrical sheet-iron vessel, D. It is supplied with a three-way pipe, the top branch of which passes through the center to the bottom of the cylinder and connects there with a wider cylinder. The latter is supplied with a large number of perforated pipes for the distribution of the gasses.

The converters, D_1, D_2, as well as the ammonia stills, E, and agitators, I, are all placed in the second or converter department.

The apparatus D_1, D_2, etc., operates in successive periods, thus:

1. Cylinder D_1, being charged with brine, receives ammonia gas and sufficient carbonic acid gas to form monocarbonate of ammonia. Cylinders D_2 and D_3 meanwhile act as absorbers of waste gases, being also charged with brine, which has already taken up some of the waste gases. D_4 contains fresh brine.

2. D_1 receives now the remaining carbonic acid gas necessary to produce bicarbonate of ammonia, and, by reaction upon the brine, bicarbonate of soda and chloride of ammonia. Meanwhile, D_2 receives ammonia gas, and D_3 and D_4 act as absorbers.

3. The first cylinder, D_1, is emptied and cleaned out by means of a steam-pipe, while the reaction and absorption take place in the succeeding apparatus.

4. D_3 receives its balance of carbonic acid gas, while D_1 is charged again with fresh brine, ending the rotation of the appparatus.

From the converters, the contents are discharged by a line of pipes into the agitators, I, of a peculiar construction and closed air-tight. Their purpose is to incorporate the materials still further. Each converter can be brought into communication independently with the brine-pump, the ammonia-still, the lime-kiln, F, the calcining apparatus, G, or the agitator, I. From the agitator the product is transported to the centrifugal machines, L, in the third or separating department. Here, by means of centrifugal force, the chloride of ammonia liquor is separated from the precipitated bicarbonate of soda, to a maximum degree. The liquor is collected in closed tanks and forced through a line of pipes to the primary heater, H, in which bicarbonate of ammonia, to some extent mixed with the chloride, is first expelled. Now, the chloride of ammonia in the still, E, is converted, by means of caustic lime, into ammonia gas, which is rectified and dephlegmated in suitable apparatus, N and O, whence the ammonia-gas reenters the converters D_1, etc., to be used again.

The contents of the centrifugal machines are transported to the calcining cylinders, G, in the fourth department. They are supplied with proper stirring and transporting tools, attached to a rotary shaft. The cylinders being heated, the small amount of ammonia chloride and half of the carbonic acid is expelled, to enter always the first of the converters in the respective circuit, while anhydrous monocarbonate of 99 per cent purity remains in the calcining cylinder. This is transported into a fifth department, the mill-room, and received by the soda-mill, pulverized and packed into barrels ready for shipment.

All vessels and connections being air-tight, so far as a good manufacturer can effect it, the loss of ammonia is prevented. By means of splitting the operation, and first producing monocarbonate of ammonia, the evolution of heat is reduced, the temperature in the converters being further decreased to its minimum by means of refrigerating coils placed within them.

All transportation of brine and gases being effected by pumps or compressor, the chemical reactions are controlled as near as it can be done within the converters. The brine entering the first will leave the last department six hours afterward in the form of anhydrous monocarbonate, ready for packing and almost pure chemically. To persons familiar with the manufacture of soda by the Lehlanc process, it must be evident that the ammonia-soda process requires less manual labor, and that of a less skillful nature, while, at the same time, the raw material, brine, is converted into a marketable product in a minimum period of time.

Mr. Heinrich gives in his paper data which prove that for a like investment of capital a Lehlanc plant for making soda would yield $36.05 profit per day, while the ammonia-soda plant would yield a daily profit of $195.52.

In regard to localities in the United States we find rock-salt in the States of New York, Virginia, Louisiana, Texas, Nevada and Oregon; strong brine in New York, Virginia and Michigan; weaker brines in the central basin of the United States, Ohio, West Virginia, Kentucky, Pennsylvania, Mississippi, Missouri, Illinois, Indiana, Kansas and Arkansas. It is particularly those weaker brines in the central basin, with cheap fuel close at hand, which would furnish a favorable opportunity for the ammonia-soda process, where the Leblanc process would find it difficult to meet the higher price of solid salt.

New Mexico.

Carlisle Mining District.

[From our Traveling Representative.]

The town of Carlisle is situated in the mountain range running east and west a distance of 18 miles east from Duncan, Arizona, a station on the A. & N. M. R. R., between Lordsburg, N. M., and Clifton, Arizona. The new comer cannot hut express surprise at the extensive mining operations going on in the camp and its immediate vicinity. Large and substantial buildings, mills, reductions works, great shaft-houses, boarding-houses, assay offices and laboratories give the place a Virginia City sort of an appearance that makes the observer's surprise an agreeable one.

The Carlisle Mine.

This mine is the property of the Chicago millionaire Fairbanks, and one or two of his friends. It is a fissure and is worked after the style of and by an old Comstock superintendent. Col. I. E. James has charge of the property. The ore body showed four feet between walls near the surface and widened out to 20 a few feet lower, and has held that width with surprising regularity down to the 400-foot level. The quartz is a gold-bearing, low-grade ore carrying considerable copper, lead and iron. Occasional streaks of black galena occur throughout the vein matter, this galena running much higher than the regular ore body. The ore runs from $10 to $35 per ton.

Ore Treatment.

The rebellious nature of the output of the Carlisle has been a source of annoyance and expense to the owners for a number of years. Only within the past few weeks has the management had any assurance of being able to realize on all of the mine's output. The ores are run from the mine directly into a 20-stamp mill. The passage of the ores through the mill is automatic; the process being battery and plate amalgamation by which about one-half of the value of the ores are saved; the other half to be realized on from treating the concentrates. Eight Duncans and a like number of Frue vans are used. The concentrates are piled up and a number of years' accumulation now waits the reduction process now about to start up. It is estimated that the value of the concentrates now on hand is over $200,000.

Underground Workings.

A three-compartment shaft goes down perpendicular on the vein over 400 feet. There are four sets of floors from the 160-foot level up toward the surface. These floors are seven feet in the clear and extend some 300 feet in length on the vein, being from wall to wall in width which averaged 20 feet. A 500-foot drift both ways from the shaft on the 300 level exposes the ore body as firm and regular as the upper floors have done. A large box tank receives the water from this level and also that from the lower level; the latter by a pump, which is again pumped into tanks above the mill and used therein. On the 400-foot level a tunnel has been run to determine the extent of the ore body at that depth and a similar condition of affairs to those found above was the result. An 8x16 tank four feet deep receives the drainage on this level and is pumped into the tank on the 300 level above. No dead work needs to be done for years in this property, as it has been planned and worked systematically and with a view of learning what could be shown up before an extensive output was attempted. The output at present with a force of less than 45 men under ground is 45 tons per day. This can be increased to over 1,000 tons when so desired. As the mill is but a 20-stamp there is no necessity to take out more ore than it is able to treat.

The Reduction Works.

The capacity of the reduction works is ten tons per day, the process being about as follows: Concentrates are dried in a revolving furnace with about 15 per cent salt; then roasted in a revolving furnace and ground six hours in pans, the pan charges being one and a half tons with 400 pounds quick, the product being a base bullion consisting of silver, lead and copper, the latter predominating. The smelting of these concentrates was found to be impracticable, owing to the scarcity of water and the cost of fuel. The Leixivation process tried on these ores showed a saving of five per cent more silver than any other.

Carlisle Reductions.

Miners are paid $3.50 per day. Board is $7 per week.

There is a tri-weekly stage line between Duncan and Carlisle. Fare, $3 up and $2.50 down.

There are two towns of Carlisle, old town and new town. The population of both are about equal.

West Camp, near Carlisle, has a fine showing of prospects that bid fair to prove up mines by development.

The irrepressible boot maker, Otter Johnson, of Lordsburg, is to be found in almost every camp in the Territory. He has a branch establishment at this place.

The recent killing of a miner by a boarding-house boss for talking about the latter's wife has had a dampening effect on village gossiping on the affairs of the sex.

An addition of 20 stamps to the Carlisle mill is talked of. Such an improvement would enable the treatment of all the low-grade ore and make the whole product one of less cost.

George James has charge of the mill and reduction works of the Carlisle. He is a young man, bright and experienced in mineralogy and metallurgy. The success of the treatment of the Carlisle concentrates is largely due to his progressive and untiring efforts.

No water is to be had except that pumped from the Carlisle mine. The supply thus obtained is but a little over one-third enough to run the machinery and the mill. By tanking, pumping back and reusing the water a sufficient supply is obtained. Wood has to be hauled some distance, and the cost is $6 per cord.

The Pilgrim mine just east of the Carlisle mine is opening up with every indication of being another Carlisle. Depth and a little capital will determine its worth as a mine. The owners, Messrs. Walls and T. J. Levy, are poor men and unable to push the property as it should be done. These men are progressive and would more than likely give an interest in the mine for capital to develop it.

East Camp.

Directly east of Carlisle is what is known as East Camp. The mines of this camp cover miles of ground. The ores are argentiferous quartz, also gold-bearing formations in variety and richness to suit the most skeptical. With but few exceptions the development of property in this camp has shown the output to be less in dollars and cents than the expenditures. The miners are a hard-working set of men whose only drawback to future wealth is a lack of capital to develop their property. The whole country is apparently stratified with numerous mineral-bearing vein matter. No depth to speak of has been reached on any of the mines. The output of a number of mines has returned excellent showings from shipments, but not sufficient to justify mining men to take hold of and push the work of extensive development.

The recent discovery of free gold in sandstone has caused the location of everything that resembles sandstone in the country for miles about. Time and a further testing of this sandstone find will demonstrate the value of the discovery.

East Camp "Concentrates."

Water is scarce.

Wood is not very plentiful.

The Nugget has abandoned work after an expenditure of $8,000.

The usual cry of "we want a mill" prevails here to an alarming extent.

Assessment work is the most of the development now going on in camp.

Dr. Davenport, of Lordsburg, has built a fine 20x40 house, and moved his family out to East camp.

The Rain-in-the-Face and a number of other mines have shipped some ore that made good returns.

Henry Harris, a Lordsburg merchant prince, has a number of good locations in East camp that promise well for developing into future bonanzas.

The discovery of gold in so many different formations in a number of New Mexico districts show that gold is like an Apache Indian in many respects, especially so in often being found where least expected.

East camp will either "boom" or "bust" this season. A number of capitalists and mining experts have visited and inspected its mines, and their investment will prove its worth or their non-investment its failure. F. W. S.

The Malone District, N. M.

[From Our Traveling Representative.]

This district lies some twenty miles northerly from Lordsburg, on the Southern Pacific. The town of Malone is situated at the mouth of Thompson's canyon. A small stream from a never-failing spring supplies the camp with water. Wood is abundant close by, and is as cheap as it is plentiful. Few mining districts enjoy the advantages that Malone does in the way of location, resources and in being a peculiarly desirable place to live. The people of the camp are of the pioneer coast class, that are noted for their cordiality to the stranger and their unbounded faith in mining in general, and Malone district in particular. The place should have been named Faithville, on account of the strong and wonderful faith exhibited by the miners of the camp in the ultimate success of the district.

The Mineral Belt.

Like nearly every mining district of the Territory, this has mineral-bearing formations peculiar to itself. For a distance of nearly three miles the course of a great contact is marked across the western slope of a spur of the Burro mountains, known as the Carlisle range, by the parapets of a porphyry dyke. These parapets range from northwest to southeast in a line directly between the district of Carlisle on the northwest and the Gold Hill on the southeast. The lead is a quartz lying on a granite wall varying in width from 12 to 40 feet. On the hanging wall between the wall and the quartz is a talc gouge, averaging about three feet in thickness, that is highly mineralized, assaying very high in silver. The quartz ore body carries both gold and silver, the latter, however, predominating. Although not of a high grade, it is of such value that the milling of it, if done by a mill on the ground, would be a lasting and paying proposition. It is a free-milling ore carrying chloride, sulphide and horn silver, native silver in a number of instances having been found in the ore.

Fine Prospects.

As yet there are no mines in the district. It must be remembered that a colt is not a horse until he has age and experience, even if he is larger in bone and muscle than the tried and reliable horse beside him. As for prospects, there are many, some of them being exceptionally good and rapidly approaching the dignity of a mine in every sense of the word. Unfortunately, the ownership of the best prospects are in the hands of poor men whose capital consists largely of muscle and experience, and whose valuation of their possessions would ruin them if assessable at their figures of rating their value. The work already done on the various properties is primitive in style and in keeping with the capital of these persevering, hard-working miners. Development so far has opened up what is beyond a doubt a number of future bonanzas. The defective mining laws of the Territory allowe a man to hold any number of mines on a ledge or contact, provided the claims do not adjoin. Thus one man could own every other claim in a district. The bad effects of this law are noticeable here. Big prices have been the mine owner's schedule heretofore. At present, however, capital can get a foothold in the camp at reasonable figures, and an investigation of the merits of the mines is almost certain to result favorable to an investment.

The Young Man.

The fame of the Young Man mine in this part of the Territory is nearly equal to that of the Old Man mine, fully described in a previous issue of the PRESS. For the development made the mine has produced more money and done less dead-work than any property in this part of New Mexico. Located most advantageously on the side-hill, easy of access by an excellent wagon road, the claim has paid from the very float of the croppings from the contact. The discovery of rich deposits of ore in a number of feeders to the contact resulted in the entire development work being done on those feeders, pushing the work toward the contact with highly satisfactory results. A 90-foot shaft in the gulch some 300 feet from the contact shows the wall of a slide running toward the contact at a right angle. A tunnel driven in on this wall 50 feet below the surface opened up excellent deposits of mineral in the silica and sedimentary formations. In the breast of this tunnel an extensive body of manganese is widening out into a chamber-like deposit. This ore runs 25 ounces in silver and carries some gold. The pay streak at the end of this tunnel is nearly 20 feet in width. A little to the south of this shaft is some 100 feet of drifting in a body of silica, between porphyry and syenite. Deposits of chloride and green horn silver occur throughout the silica which itself is more or less mineralized. Three other shafts, the deepest being about 60 feet is all the development work as yet on the mine. These shafts show a more solid formation, the ore bodies being a quartz. The pay streak averaging from 12 to 20 feet assaying regularly in such a manner as to average 25 ounces in silver and nearly $10 in gold. So far the ore of this mine has carried nearly enough gold to pay the expense of mining and milling. Out of less than 450 feet of actual development and dead-work the shipments have resulted in the production of over $12,000 in bullion.

Making a Mine.

The Young Man if developed by capital and labor-saving machinery would, inside of 60 days, be a bullion producing mine that would astonish even an enthusiastic Maloneite (and they are hard to astonish), and pay its management handsome dividends. The great bulk of low-grade ores that cannot be shipped at a profit would pay for a mill, and could be kept running steadily for months on the many ore dumps of the district. A more desirable property for a company of capital and practical mining sense is not to be found in this part of Grant county.

The Malone Group.

Judge J. B. Malone and T. E. Brown own the above group consisting of the Tenderfoot, Montana and Sitting Bull. The former shows the most development work done. The formations are similar to the Young Man mine, the group being a continuation of the contact with but one or two claims intervening. Only about 75 feet of work has been done on the Tenderfoot. A number of shipments, several cars in all, have been made from this group. The pay streak averages about 14 inches in width assaying as high as $200. The shipments averaged $168. These claims as well as the Young Man have paid more than the expenses of working them.

Telegraph Communications.

Messrs. Birt and Beatty, of Lordsburg, completed the erection of a telegraph line between Malone and Lordsburg, on April 24th. The putting in of this line at this time speaks volumes in behalf of the stability of the camp. While they are a little premature in establishing this desirable and convenient enterprise, yet their so doing will result in a more rapid advance in the future of the entire district. A camp that shows up sufficient to justify the early erection of 23 miles of a telegraph line is certainly deserving of the attention of men who are seeking investment in legitimate mining.

Malone Briefs.

The Novelty is working on a lease.

A force of about 20 men is at work on the Young Man.

A tri-weekly stage between Lordsburg and Malone is managed by D. M. Potter. Fare, $2.

The number of claims bonded by parties looking for good property is encouraging to the camp.

The crack bootmaker of the county, Otter Johnson, of Lordsburg, will open a branch store at Malone.

The road from Lordsburg to Malone has no equal in the Territory for both pleasure and serviceable driving.

The MINING AND SCIENTIFIC PRESS has the largest circulation of any paper coming into the Malone district.

O. R. Smythe, one of Lordburg's most enterprising and progressive citizens, is largely interested in this district.

G. C. Warner, one of the owners of the Young Man mine, has a general merchandise store at Malone city.

The murder of Judge Macomas and his wife by the Apaches in '83 occurred almost within sight of Malone city.

The Malone group is pushing development with a good force. A recent shipment of 1,840 pounds of ore netted $273.

An old-time Californian, in the person of N. P. Mikesell, formerly of Auburn, is one of the owners of the Young Man mine.

The Malpais lies 600 feet north of the Young Man and is down 30 feet on ore. Dorsey & Conway are owners of this fine prospect.

The Dove and Cowboy adjoin the Young Man on the north. The former has considerable development on and shows good ore in places.

L. Beatty, an enterprising go-head Lordsburger, has opened a butcher shop in Malone to "meat" the wants of this rapidly growing camp.

Law and order abiding citizens is the class of mining and business men of Malone. The place lacks the customary presence of the blackleg and gamblers.

Water in goodly quantities can be brought from Thompson's canyon in pipes, so as to cover the town and enable a mill to be supplied but a short distance from the mines.

California capital has been solicited to examine the Young Man mine. The purchase of that excellent property by a California company would be the making of Malone as a mining camp.

The Malone operator, Major R. L. Nellis, late of Chicago, has imbibed the faith from the old timers, and if there is anything the district won't produce in the way of mineral the Major has not heard of it.

The Malapise is being worked by E. A. Anderson on a lease. Considerable ore has been taken out of the 30-foot shaft now down on the upper edge of the contact. A shipment will be made of this ore during the present week.

The only danger to Malone's future prosperity and its reputation as a substantial district, is the weekly "Boom Budget," announced by a four-page dodger hard by. Men who are watching mining districts with a view to purchase do not notice the indiscriminate publications of hummer correspondents or the announcements of amateur advertisers, who don't know the difference between sand carbonates and native copper. This making of a fine mining camp should be careful ere it is too late, and not allow irresponsible men to send communications to would-be papers of like standing.

F. W. S.

GLOBE DISTRICT.—The Arizona *Silver Belt* says: Our prediction that more silver claims would be worked in Globe district this season than ever before is already verified, although only two weeks have elapsed since we made the statement. There is now a strong probability that the Old Dominion Company will soon resume and the temporary suspension will prove a benefit to the camp instead of an injury, as many feared. A great many men who have begun chloriding will stay at it if they can make wages, and from present indications it is pretty certain that most of the claims being worked will pay well. Should the Old Dominion resume, there will be an influx of new men and we will have the liveliest camp in Arizona. During the past week a number of leases have been made and work begun on a good many claims.

PLACER MINES. — Rich placer mines have been discovered on Skull creek, a few miles above Willow creek. The gold is coarse and pure, and is found in paying quantities where water can be had for ground sluicing. Joel Bradshaw, of Paradise, who has a claim in the new diggings, has a vial of the "dust." This year the water is scarce in the diggings, though last year, before it was known that gold existed there, water was abundant in the creek.—*Silver State.*

AMALGAMATED IRON-WORKERS.—At a meeting of representatives of iron trades unions held last week, an amalgamation of the iron-moldere, pattern makere, blackemiths, machinists, boilermakers and amalgamated engineers was agreed upon, and the following were elected as permanent officers: President, J. B. Johnson; vice-president, Stephen Gunn; recording secretary, John Mahoney; financial secretary, Joseph Valentine; treasurer, Joseph Turner.

The placer miners of Shasta county will now hang up their picks and shovels for the summer.

Engineering Notes.

Compressed Air Power.

At Guinnesec Falls, Michigan, the water-power is used to compress air, which is conducted through a 24-inch pipe to the iron mines, a distance of three miles, where it is used for operating pumps, engines and drills in place of steam. The head of water at the falls is 47 feet and drives three turbine water-wheels, each of which operates a pair of air compressors, and the whole plant has been in satisfactory operation for over a year. One of the earliest instances of the application of air on an extensive scale in the operation of drills was, says *Engineering*, in the excavation of the railway tunnel, 28,081 feet in length, which pierces Hoosac mountain, situated in western Massachusetts, where a rapid river at the eastern terminus furnished the water power which was used to compress air which actuated the drills, while the exhaust served to ventilate the tunnel. Several years ago the manager of the cordage works at Plymouth, Massachusetts, introduced an air locomotive which took the place of some sixteen horses and an equal number of men employed in transporting material from one department of the establishment to another.

The risk of fire prevented the use of a steam locomotive in these ropewalks and mills. The air passes from the reservoir, which takes the place of a boiler, through a reducing valve into a receiver, where the pressure is maintained at 90 pounds per square inch. Thence to the cylinders, where it is used like steam, except that the refrigeration produced by the expansion of the air is so great that it is necessary to use very limpid oil for lubrication on such places. The compressed air is furnished from a receiver of boiler-iron, which supplies a system of underground pipes with hydrants at convenient places, and when the air supply at the locomotive is becoming low it is stopped near one of these hydrants and a hose with a snap coupling attached, and the air supply replenished with little delay. At one of the fairs of the Charitable Mechanics' Association, in Boston, the management forbade any fires in the building, and as a consequence the exhibitors of portable engines considered that they were deprived of opportunities of showing the operation of their class of engines. One exhibitor showed resources equal to the occasion, for he connected the exhaust pipe of one engine in his exhibit to the boiler of another of his engines, removed the safety valve and connected the fly-wheel by belting to the shaft which was kept in motion by the main engine of the exhibition. This method of driving an engine furnished a supply of compressed air into the second boiler, whence it was used for motive purposes. Soon the manager learned that these portable engines were in operation, and, assuming that the regulations concerning fire were necessarily violated, sent a worthy colored messenger to examine and report the facts to him. After looking these engines over very carefully he reported that they were running the engines in question with the "northwest wind or something or other." A group of laborers were examining the engine, and one of them gave his opinion that "cold steam and no fire was the greatest invention yet."

The Cape Cod Canal.—Work on this important undertaking is still progressing. The great dredge, which is doing the excavating work, has passed quite a distance inland from Cape Cod bay, and is now floating in the elongated basin which it has prepared for itself and where it is still cutting its way, slowly but surely, to the marshes at the head of Buzzard's bay. It lifts its load of mud or sand some 56 feet high, drops it into a proper receptacle, from whence, in the form of fluid mud, it is conveyed by pipes 300 or 1,000 feet away, as the need may be. The canal is just now being run through, or in the neighborhood of, a locality made famous years ago as the favorite trout fishing grounds of Daniel Webster and his legal friend, Sidney Bartlett. It passes near "Swift's old tavern," which, if it had a voice, could tell many an interesting story of the brave cheer and merry-making of those two famous fishermen of the ancient days, when railroads had hardly been thought of, and when stage coaches were the only means of public conveyance by which those old nestors and their "Boston friends" could reach this famous region for fishing sport or a clam-bake.

A Monster Steamer.—The steamship Etrasia, a sister ship of the Umbria, built by John Elder & Co., for the Cunard line, has just left the Clyde on her maiden trip to New York. She is built of steel, 520 feet long, 57½ broad, 41 deep, 8,000 tons burden with engines of 12,500 indicated horse-power.

Even for the naval cadetships there is an overwhelming rush. The President has three vacancies to fill, for which there were 140 candidates, and several hundred applications for cadet appointments have been made since.

The Board of Supervisors of Sutter county have ordered a bridge to be built across the tules on the road from Yuba city to Meridian, at a point known as the "Stone Road," at a cost of $15,000.

Useful Information.

Rust Cement.

One of the most adhesive and durable of cements known to mechanics who essay to unite iron surfaces is the oxide of iron itself; with this a joint can be made so perfect and sound that the iron will break before the cement will part. In removing the cast-iron pipe of a bilge pump from a ship that had made four Atlantic voyages, it was necessary to take the sections apart. The flanges had been pasted with a cement of cast-iron drillings and filings, mixed with sulphur and sal ammoniac, moistened with water. Then the nuts—three in each flange—were set upon the bolts, and the union was completed. The four voyages—going and returning—occupied nearly a year. When the separation of the parts was attempted, even the cold chisel was unable to make a division between the solid castings and the intervening cements. The sulphur and ammoniacal salts are simply means to more rapidly oxidize the iron drillings and filings—the iron rust is really the cement. If time is allowed, ordinary water or salt water would act as a solvent.

All our iron ores are simply oxides, and when they are exposed to the atmosphere they show the ordinary color of iron oxide—red. This oxide gives the red color to the "brownstone" (red sandstone) so much affected for building purposes. These stones are only sand cohered in mass by iron rust. Their formation can be witnessed even now on some of the New England beaches. The narrow and slightly raised windrows of sand thrown up by some heavy storm or some very high tide, so that they are beyond the reach of the every-day effects of common tides and ordinary winds, can be noticed slowly solidifying. Fragments may be gathered which are only sand slightly held by the oxide, but others may be found which are embryo stone—if such a term may be allowed—solid to the feeling, and capable of being thrown as missiles. Beyond these are the shingles of the beach and the cliffs that define the shores. In olden time this sand and this iron was mixed, subjected to pressure by outerlying layers, and at length became "solid rock," as we call it. And yet this quarried rock of sand cemented with iron is still somewhat soft, and for building purposes requires seasoning—the gradual reabsorption of the water given by the atmosphere and this water is essentially salt, or it has the oxidizing effect of salt water, for its effect on iron is similar to that of salt water on the iron under similar circumstances.

It is evident that any substance that induces rust in iron is not a safe one to use in connection with permanent structures of iron. Some years ago an instance of iron in connection with red sandstone — brownstone—was noticed, where wrought-iron rods were secured into steps of brownstone. The stairway was removed, and the iron in the stone was disintegrated into mere threads. In this instance the holding of the iron balusters was sulphur. And sulphur is much worse than lead; it is impossible to secure iron in stone, or even in iron by sulphur. Lead is perhaps as safe as any material that is not too expensive to use. In removing an iron fence the embedment of the palings in lead lining the holes in the stones, making a superficies of about fourteen inches, was readily overcome by lever action, while the cross-section of the same paling through iron rails, iron on iron, the area being less than three and a half inches, necessitated the use of hammer and cold chisel.—*Scientific American.*

Mother-of-Pearl Designs on Tissues.—A German has patented a design in Germany for producing mother-of-pearl designs on cloth by the following method: A thin layer of caoutchouc is spread over a thin copper plate, on which the design is cut. The cloth is spread over the plate and a hot roller passed over it. By the heat the caoutchouc layer becomes liquid, and by the pressure it adheres to the cloth on which the required design is thus obtained. The cloth is now covered with powdered mother-of-pearl, which is spread evenly by means of a hot roller, and the excess of mother-of-pearl which does not stick to the cloth is taken away by means of a soft brush. The cloth is now covered with very fine crepe which has been wetted in gum water, and after drying the crepe can be made fast on the cloth so as to protect the mother-of-pearl powder from falling off, while owing to its fineness and transparency it does not spoil the brilliance of the powder.

It has been asserted that the quality of tea may be approximately estimated by the weight of ash which it yields, the value of tea being inversely proportional to the ash. M. Nikatinski has lately, says the *Grocer*, made a series of experiments, with the view of testing the truth of this assertion, and finds that the ash is a very fair index of the quality of the tea. Thus, a good Shanghai tea gave 5.16 per cent ash, a cheap green brick tea 6.87, and two Orenburg teas, which are known to be adulterated with rose leaves, and of which the price was 115s. and 48s. per cwt., yielded respectively 7.87 and 10.42 per cent of ash.

Rolled Gold is thus manufactured: An ingot of brass is cast, and while it is yet hot a thin layer of gold alloy is poured upon it. When the ingot thus covered becomes cold it is forced between steel rollers until a long thin ribbon is produced, of which the proportion of gold and brass is, of course, the same as that of the ingot. The percentage of gold is often reduced very low—sometimes to two and three per cent. This rolled gold in cheap bracelets and watch chains lasts for 10 years.

A Fruitful Grain.—A grain of wheat sown by the wind grew without cultivation in the midst of a meadow at Chatillon-sur-Chalaronne. On cutting the hay the tuft was left undisturbed and allowed to ripen. At harvest time it was found that the single grain had produced 53 stalks, 43 of which bore fine heads, yielding a total harvest of 1,563 grains.—*Les Mondes.*

Tuning forks and grindstones are now made of glass. Rails and sleepers are manufactured from the same transparent material. The new process is a simple one, and produces hard-glass castings at a cost of $1.32 a cwt. If iron does not reform its oxydizing habit it may be replaced by this temperate and attractive rival.

As Carrier Pigeons in China are often molested by birds of prey, an ingenious plan for protection is employed. Ten small bamboo tubes are attached to the bird's tail by means of threads passing under the wings. The hasty flight of the bird produces a whistling sound, and this keeps birds of prey at a safe distance.

Ancient Shields.—In the Tower of London are 21 specimens of shields, with a pistol attachment in the center, the weapon being a breech-loader, and slightly projecting, so that it would hardly be noticed by an enemy until it was discharged. All these shields were carried in former times as "concealed weapons."

In Bees the crop is called the honey bag. The gizzard is found in insects having mandibles, and is frequently lined with rows of horny teeth, which are especially developed in grasshoppers, crickets and locusts. Insects have no true liver, but its functions are performed by little cell masses on the inside of the stomach.

The Largest Gun yet made is being constructed at Woolwich arsenal. It will weigh 200 tons; measure 43 feet 8 inches in length and 5 feet 6 inches in diameter at the largest part, and have a 16-inch bore.

Good Health.

Healing by Faith.

It is not our purpose, says the *London Lancet*, to deny, or even question, the verity of "cures by faith." The "mind" so acts on the body, and the brain plays so important a part in the nervous system, by which the whole organism is energized and controlled both in regard to its functions and nutrition, that it is not only quite possible, but an absolute fact, that many maladies which are not so far advanced as to be dependent upon changes in structure, or "organic diseases," may be remedied by or through the agency of the mind. We will even go so far as to affirm that a very large proportion of the ailing might be, and probably would be, sound if only they were sufficiently strongly impressed to believe themselves to be so. This influence of the mind on the body has been the stronghold of quackery from the earliest times, and "faith" is as powerful an influence for good or evil now as it has ever been. Such "miracles" as the Salvationists are working with their presage among the emotional classes, whether illiterate or well-informed, have uniformly signalized the commencement of a new era in religious enthusiasm. When the first enthusiasm subsides, "miracles" cease of physico-mental necessity. The large class of so-called hysterical, cataleptic, and even epileptic affections, are distinctly amenable to this influence; so are those nervous disturbances and derangements which consist wholly or chiefly in disorderly activity, as distinguished from actual disease. The mimetic maladies, of which there are always a very large number of cases, are, of course, amenable to the curative influence of faith. Outside these classes, however, stand a multitude of badly-managed or misunderstood cases which only need to be placed on a new footing—it matters little what—to get well. A wondrous crowd of ignorant prejudices still hovers over many districts as to the curability or hopelessness of special diseases which are better understood and more successfully treated—on common sense principles—in the centers of knowledge.

For example, we know of localities and affections which, being associated, produce the most dire delusion as to the length of time hones usually take to unite in healthy subjects; and how coughs and other distressing maladies are, or are not, under the control of the will. In such combinations of facts and fiction, it is easy to get miracles out of such common matters as the union of the accurately applied ends of a fractured radius in three or four days! There is not a word to be said against "healing by faith." Every busy practitioner has cases under his observation that he would be heartily glad to find so powerfully affected that they could be cured even by this agency. All we are anxious to point out is that an intelligent lay press ought not to lend itself to the promulgation of nonsensical beliefs and impressions. Of course, it is true that many of the poor people who are reported to be "cured" are actually benefited, and by their faith. This is a fact, and there is no sort of reason why the benefits received should not be permanent. If the subjects of these cures are thankful to the Giver of all good, that is not a matter to make merry about. It is as it should be. We are glad of their gain, and pleased to find them moved to gratitude. Meanwhile if these "cures" need be discussed, let the comments made be neither irreverent, offensive, nor puerile. The *modus operandi* of such recoveries is perfectly well understood, and there is nothing either specially noteworthy or wonderful about them.

Hours for Sleep.—The latest authority on the vexed question of sleep, Dr. Malins, says that the proper amount of sleep to be taken by a man is eight hours. So far as regards city life the estimate is probably correct. Proverbial wisdom does not apply to modern conditions of social existence. "Five (hours) for a man, seven for a woman and nine for a pig," says one proverb; and a second quoted by Mr. Hazlitt in his English Proverbs, declares that "Nature requires five; custom gives (allows—?) seven; laziness takes nine and wickedness eleven." These conclusions were, however, drawn from observation of country life. Physical fatigue is more easily overcome than intellectual. Men, however, who follow any intellectual pursuit are exceptionally fortunate if the processes of restoration occupy less than seven hours. More frequently they extend to eight or nine hours. Kant, I see it stated, took never less than seven hours. Goethe owned to requiring nine. Soldiers and sailors, on the other hand, like laborers, do with a less quantity.

Death Traps.—The American *Cabinet Maker* contains a few short remarks on "death traps" that deserve to be copied over and over again in every technical journal. "There is not a mill or shop in the United States," says our contemporary, "but what contains some death trap which needs boxing up. Steam engines are bad enough, but they are harmless compared with set screws projecting from collars, bolts from couplings or belts running unprotected upon pulleys in or near passage-ways. The law orders these things to be protected. They are safe enough; it is the people that want protection, and the machinery is free trade in this respect. It is a pretty sure thing that if a man gets killed in a factory the owner thereof has to pay for it, but it does not seem to make owners any more careful to weed out and cover up the danger holes in our shops and factories." How many establishments are there in the United States where the above would not find an application somewhere?

Drowning not Painful.—A good deal has been written as to what the sensations of people are supposed to be who are drowned. The *Nautical Magazine* for March relates how a little girl who was thrown into the Thames, at Kew, by her nurse, explains the matter to a jury in her own simple way: "I sank till I felt my feet touch the bottom, and then I fell asleep till I found myself wrapped up in a blanket in the boat house." She added: "There was no pain beyond the first shock of the water." It may thus be gathered that death from drowning is by no means a painful one.

Disinfectants.—A true disinfectant will kill the germ in which the contagious principle resides; mere deodorization is of no avail. Carbolic acid is effective in destroying germs—turpentine is a good disiofectant of some odors. It is thought that gas-lights and mineral-oil lamps act as disinfectants from the gases they throw off. Professor De Chaumont says "there is but one true disinfectant, and that is fire." So we can burn up germs sometimes, and when fire can not do the work of destruction carbolic acid may be called in to help.

Camphor and Cholera.—At a recent meeting of the Homeopathic Medical Society of New York several physicians read papers on cholera, and all spoke highly of camphor as a remedy. One doctor said that during a certain cholera epidemic in Europe 2,000 people, each of whom wore a small bag containing camphor about their necks, escaped, although exposed to the disease, while others died by the hundreds. Pure water, good ventilation, regular and correct habits, and wholesome surroundings are the best preventives known.

Rain water.—That rain-water is more wholesome than hard water for drinking purposes is correct in the main. Ordinary cistern water is unfit for use; it should be purified by filtering. Hard water may abound in earthy or mineral matters and be very injurious, notwithstanding it may be comparatively pleasant to the taste.

The Magnet in Disease.—The use of the magnet for the cure of diseases was known to the ancients. It was known to Aetius, who lived as early as the year 500. He says: "We are assured that those who are troubled with gout in their hands or their feet, or with convulsions, find relief when they hold a magnet."

To Disguise the Taste of Paraldehyde.—Sutter finds that rum and tincture of lemon combined with paraldehyde make it palatable.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MAHONEY.—Amador *Ledger*, June 16: This mine resumed operations Monday morning, under the superintendency of Morris Brinn, with Jos. Savage as underground foreman. Six men are employed in cutting a station at the 600-foot level, from which point it is expected that sufficient ore will be taken to start the mill shortly. Mr. Brinn informs us that he has purchased or leased one-half interest in the property, with one year's time in which to pay the money. In the meantime the mine will be judiciously handled, the rock carefully sorted if necessary, and every effort made to put it on a paying basis. Morris Brinn is a careful and shrewd business manager, Mr. Savage is a No. 1 practical miner, and if it is within the bounds of possibility to make the Mahoney a remunerative mine, we expect it will be accomplished under the existing regime.

SUTTER CREEK.—The familiar sound of the Mahoney whistle was heard for the first time in many months on Monday morning. It turns out that parties in this county have taken the property in hand, just who I am not prepared to say; but the proposed plan upon which the mine is to be worked is far from satisfactory to those needing employment. The proposition is to guarantee one-half the wages in cash—$1.25 or $1.50 per day as the case may be, and the payment of the balance will be contingent upon the mine paying. If it fails to pay the men will lose one-half their wages. Already some difficulty is experienced in getting men on these terms. The contractors engaged in sinking the shaft at the Voorheis claim are encountering some difficulty with water. They have to bale it out until Mr. Voorheis gets back from the city, when he will no doubt put in a small pump.

AMADOR QUEEN.—The erection of the 20-stamp mill on this mine in Hunt's gulch is making rapid headway; some 15 men are employed about the work. The mortars that were sent up were found to be unsuited and had to be returned. The four new mortars are expected up this week. Three Duncan concentrators have been received, the only concentrators of this make in the county. They are intended for test purposes, and if satisfactory 12 more will be put in making 15 in all. Mr. Shugert went below Monday morning to look after the mortars and other matters pertaining to the mill.

Calaveras.

ANOTHER RICH STRIKE.—Calaveras *Chronicle*, May 16: It was but a short time since that we recorded the finding of some very rich rock in the Tiger mine, near Rich Gulch, owned by Mr. C. Schlund, our local banker. One day last week the men who were engaged in sinking a shaft on the vein struck a "pocket" of unexampled richness, the specimens found being the handsomest we ever saw. The gold was actually chiseled from the quartz. It was literally a vein of pure gold running through the rock. A quantity of large flakes of gold were picked out with only a small particle of rock clinging thereto, while others were absolutely free from rock and nothing but the pure metal. Four flour sacks full of quartz and gold were chiseled out of the vein. The shaft in which this rich find was made is between 70 and 80 feet deep, and about 400 feet distant from the prospect shaft in which the former strike was made. The extent of this rich "pocket" is not known. This was left to be revealed later, while sinking is being continued for new developments. "Played-out Calaveras," as some are pleased to call it, will yet prove that it isn't yet so badly "played out," and that its wealth in gold is far from being exhausted.

El Dorado.

TUNNEL.—Georgetown *Gazette*, May 15: Sam Watson and Jos. Swazey completed their tunnel last week in their seam-pocket mine south of town, running up an incline to their shaft, and having placed in a line of sluice boxes are now drifting on the seams. They merit much success. Will Gibbs is one of the force.

ECLIPSE.—Placerville *Observer*, May 16: W. M. Keefer has taken a bond on the Eclipse mine, near Jayhawk, and has arranged with the Gray mill to crush 100 tons of ore, fifty tons of which is now on the dump, and the balance easy of access. Twenty tons of rock from this mine was worked some time ago, and went $8 to the ton. H. P. McNevins and P. J. O'Connor, of San Francisco, came up on Thursday last, and proceeded over to the Darling mine, on Bear creek, returning on Friday. Mr. O'Connor has taken the bond on the mine held by McNevins, and let a contract to run the tunnel fifty feet further, and is negotiating for hoisting works for the purpose of sinking below the tunnel.

THE GREENSTONE.—Mountain *Democrat*, May 16: A *Democrat* reporter visited this group of mines last Monday, and reports developments as actively progressing on nearly every mine on the belt. At the Florence, owned by Tuck & Son, a new double compartment shaft is being sunk, which has already attained a depth of 40 feet. It is intended to sink to a depth of 110 feet, at which depth it is expected to tap the ledge. Since our last report from this mine a new Huntington mill has been erected, and the owners express themselves as delighted with its work. At the Barns mine, 1,000 feet north of the Florence, a new prospecting shaft is being sunk 250 feet north of the old works. The shaft is now down about 50 feet. Work has been resumed at the Eureka, owned by Graham Bros. This was formerly the Bonanza mine of the belt, and the owners feel confident that it will yet distance its former record. Crane & Elliott are busily engaged freeing the deeper workings of this mine from water, when work will be actively resumed in the lower levels. The present promises to be a lively summer on the Greenstone, and one we hope will be prolific of big strikes.

Inyo.

BROWN MONSTER.—Inyo *Independent*, May 16: Yesterday a shipment of 10 tons of ore was made to San Francisco. About 30 tons more are on the dump but shipment is delayed for want of sacks. Mr. Stirk came up from San Francisco to the Maxim mill about the begining of the week, to assist in putting the new concentrators in operation. Before he got there, however, Mr. Stansfield had already got the machinery in thorough working order, and was doing good work. The ore is reduced in the proportion of about ten tons to three, or two and a half. Peter Laird was prospecting a claim adjoining Freeman and Coates, near Bishop creek. He ran a cut about 45 feet deep on the ledge, but has suspended all further operations for the present. Mr. Laird will soon resume work on a mine in the Inyo mountains, where he has already done a good deal of prospecting, and with very satisfactory results. Sam Piper was over at Big Pine last Wednesday from Fish Lake valley. He brought over some samples of ore containing native silver that would run up into the thousands of dollars per ton. Two men who are prospecting a claim at the White Hill got out six tons of ore during the month of April, that will net them $450. In addition to getting out this amount of ore, the men did dead work during at least 10 days of the time.

Mariposa.

THE DILTZ.—Cor. Mariposa *Gazette*, May 16: We have lately been digging away the debris and rocks from over the Rickard shaft, which was brought there by a land-slide during the rains of '84. As the shaft was previously covered over with timber it was prevented from getting filled up; but as it is, the vein shows within a few feet of the bottom, which is 120 feet west of the hanging wall, and does not, at this point, show a smooth or regular foot wall; but by its being full of strata of quartz and red ocher, proves that it is all vein matter on the westerly side of the hanging wall. The vein and matter shows on the surface which has been sluiced and cleared away over 20 feet wide. This is the most northerly shaft and will have to be sunk 216 feet more to strike the lower level which is started in from below the spring on the Sherlock gulch side of the hill and which tunnel or level will have to be driven about 600 feet. I have also sunk down on the fissure a few feet, say 15 or 20 above the spring, which has cut the water off from it. All the vein on this side of the hill necessarily lies deep under an old land-slide, and the gold from it originally went down into the Sherlock gulch below. The whole width of the vein on the south side of the hill shows now to be 110 feet and getting wider as it goes down and contains gold all through. I can now get ore and vein matter to be tested from any shaft or open cut on the mine. Respectfully yours, JOHN S. DILTZ.

Nevada.

WASHINGTON DISTRICT.—Cor. Nevada *Transcript*, May 13: The IXL quartz mine at the head of Diamond creek, which was closed down about a month ago, is to be started up again in a few days. The Hunken boys, John and Nick, have a very fine prospect in quartz lying just to the north of the Eagle Bird, of which it is supposed to be the southern extension. The ledge is from three to four feet wide, full of sulphurets and galena, and shows rich in free gold. There are a number of good looking ledges on Diamond creek, but none of them have been much developed as yet. John Dill is still on his pins and doing well. Omega has had new life infused into its veins quite recently by the starting up of new mines close by. Ferguson & Co. are putting up a 20-stamp mill in the immediate vicinity and one or two other mines are to be started at once.

Plumas.

THE BULLION COPPER MINE.—Greenville *Bulletin*, May 13: From Mr. A. J. Ford we learn that work on the above mine has been resumed by Walter Ford and A. E. Torrey. He says that the prospects are good as progress is made. The lode is well defined and the quality of ore is improving.

OPHIR CONSOLIDATED.—Some mining men were in town the other day examining this mine. They expressed themselves as well pleased with the prospects. About 900 feet up the mountain from tunnel No. 3, a shaft is being sunk in a large ledge formation which looks very well. Mr. Hall says he is well pleased with the prospect.

GOLD STRIPE.—Mr. Standart, superintendent of this mine, informs us that work on the upraise continues. It will take about ten days to complete this, when work in the tunnel can be prosecuted with vigor, as the miners will have pure air to work in. The tunnel will be pushed ahead as rapidly as possible to reach the chimney worked above, which it is expected to strike by running between two and three hundred feet. The backs will be about 300 feet.

ENGLES COPPER MINE.—We learn that the prospects of this mine are still brighter. The ledge is of enormous size, being 52 feet in width and well defined. The owners have shipped some of the ore to San Francisco, and it assayed 26 per cent. If the ledge will average anything like the result of the assay the property is extremely valuable. Work has been progressing since the mine was last spoken of in the columns of the *Bulletin*. A road about four miles in length leading to the property is nearly completed. It is expected that reduction works will be erected during the summer. We understand that capitalists are becoming interested in the mine, and that little doubt is entertained that Plumas will soon have a large copper mine in successful operation.

THE MAY FLOWER.—*Herald*, May 16: P. Crary, who came down from Forest Hill a few days ago, informs us that the sights at the May Flower mine reminds the old Californian of the days of '49. They are down in this mine, Mr. Crary thinks, to the main channel of the divide, and the quantities of big chunks of coarse gold they are taking out not only gladden the heart but help the eyes. This big channel struck in the May Flower is supposed to extend from near Forest Hill to above the Secret House, a distance of some 20 miles. If this theory is correct, and few miners now familiar with the location doubt it, there is more money yet on that divide than was ever taken from the Comstock, and it can be secured with less expense than was necessary on the Comstock mines.

MOHAWK NOTES.—Plumas *National*, May 16: Chamberlain & Flint have been crushing quartz from their mine, in the Hapgood mill, and the first three day's run they had a fine prospect, but on the fourth day they found to their dismay, that some mean, low, contemptible person or persons had put kerosene oil on all their quartz and all through the mill, consequently no test could be made, as they could not save the gold. They have more men at work in the tunnel, which is in 40 feet now, and at 60 feet they expect to tap the ledge, then we will look for lively times. Business seems better in this part of the county now than it has been for a long time. Messrs. Johns, James and Hoskin were in this part of the valley yesterday looking at the mines. There are several men here from Reno and other places looking after mining interests.

Shasta.

PROSPECTING.—Shasta county *Democrat*, May 13: About 50 miners, mostly new-comers, are prospecting in the Buckeye district, we are told. Good reports continue to come from Copper City. The new milling enterprise is working successfully and in every way satisfactorily to the company. Two rich quartz strikes of gold and silver were recently made near Oregon Gulch. Ore from one of these claims assays $1,900 in gold and one-half ounce in silver. During the past week about ten locations have been made on the belt in which Dan O'Neal's Florida mine is situated. The locations are all south of the Florida, and several of them are fine prospects. The Spencer mine at Sunny Hill has a 140-foot tunnel and a shaft 170 feet in depth on the ledge. The lead is 9 feet wide and averages $30 per ton. A San Francisco company is negotiating for the purchase of this fine property. Barney Spencer, Harry Burke and O. P. Woodward have struck a fine prospect near French Gulch. It is an extension of the Mad Ox. The vein is 10 or 12 feet wide and the ore carries free gold and a big percentage of high-grade sulphurets. Mr. Flagg, a mining man and member of a San Francisco mining company, is negotiating for the purchase of the Florida mine, Dan O'Neal's property, for $20,000, and has been given 25 days' time to make up his mind whether he will take it or not. Ed. Reid and company are building roads and erecting an ore and mill house, and as soon as these preparations are completed will put up a 5-stamp quartz mill on their mine, which is situated about one mile north of Dan O'Neal's claim. This property is already quite well developed, and they have several hundred tons of rich ore on the dump. George Banghart is working a quartz ledge on shares on Sugarloaf mountain, this side of Centerville, that is about as rich as anything yet found in the county. The vein varies from a few inches to three feet and pays from $10 to $60 to the pan. Where the vein is smallest the rock is richest. Three or four shafts have been started, but the deepest is only 12 feet. Lowrey, the boss pocket hunter, owns the property. Tom Harrison has struck it rich. The new strike is on the south end of one of the leads near his house. Last week he started in to run a cut across the vein preparatory to running in a drift, where he intended to take out quartz to crush in an arastra. During the first day's work he struck a body of ore that will pay from 25 cents to $1 to the pound. We are informed that he was offered $500 a ton for five tons of ore that is in sight.

Sierra.

THE FOUR HILLS MINE.—Sierra *Tribune*, May 14: It is reported that large quantities of good paying ore is being extracted at the Four Hills mine. The mill is running to its full capacity. Sierra county is full of such mines. All that is needed is a little money, the open sesame, to develop their richness. This mine remained idle for years, awaiting the touch of the magician's wand (capital) to bring its immense treasures to the surface to enrich its owners. Under the judicious management of Mr. Reynolds, it is paying handsome monthly dividends. Jesse Carney came down from Poker flat this week and reported that the quartz crusher, recently erected at the Belmont claim, would have to be moved to another place, as the foundation was caving away. This is an unfortunate occurrence, as the mill was already to start up.

COLOMBO MINE.—For several days past it has been freely circulated about the streets of this town that the ledge had been encountered in the lower tunnel at the Colombo mine. From all information that the *Tribune* reporter could gather without a visit to the mine, it is a foregone conclusion that the long sought for ledge has been found. The latest information at hand concerning the strike was that they had run four feet into the vein and were not yet through it, also that gold was found in the rock. An additional force of men have been put to work at the mine, and the ledge in the lower tunnel continues to improve.

BELMONT CON.—*Mt. Messenger*, May 16: The Belmont Consolidated quartz mine is located above Poker Flat, on a spur of the mountain leading up to Mount Filmore, as we understand the situation. The new rotary mill, for which Robt. Forbes has the right, was started last week, and proved a complete success, crushing rock rapidly for so small and cheap a machine, and requiring but little power to run it. Ten inches of water, under a 125-foot head, furnishes ample power with a three-foot Pelton wheel. The shaft is now down 70 feet, all the way in rich rock. There is a tunnel now within about 20 feet of the bottom of the shaft, and a connection will soon be made, and rock for crushing furnished through this outlet. The ledge itself is some 40 feet wide, but the rich streak will average perhaps four feet. The ledge has been located many times, and at one time an arastra was put up on it and run for some time, but when cleaned up, neither gold nor quicksilver could be found. The rich rock carries a large percentage of arsenical sulphurets and heavy pyrites, which almost precludes the possibility of working it successfully in an arastra. The new mill, however, seems to be especially adapted to successfully work this character of rock, in that it bids fair to be an excellent amalgamator in the battery, and in giving the pyrites no opportunity to "bed" on the bottom. When the mill had been running a short time it was discovered that leakage from the pipe was causing the ground on which the mill stood to soften and the mill to settle, it having been erected on an ancient slip, although this was not apparent until the ground became saturated with water. The delay will be but trifling, as the machinery was all taken down and removed to a solid cement foundation about 200 feet down the hill, in a day and a half. At the new location there will be about 30 feet more head to the water, which in time will be of great advantage in working the mine and will more than compensate for the slight cost of removal. Properly fed, the mill will crush about five tons a day. It is of course but a prospecting mill; but it appears to be far ahead of any arastra, when all things are considered, both as to efficiency, cheapness and portability.

Trinity.

CRUSHING.—Trinity *Journal*, May 16: P. A. Lefren & Co., owners of the North Star quartz mine in the East fork mining district will start Saturday to crush rock in their new mill, the New Patent Crusher. They have got good rock, a good mill and consequently the North Star boys will produce the bullion.

QUICK TRIP.—Two young men came through from New River this week in good time. They left White Rock after breakfast and walked to North fork for supper, carrying their baggage—about 40 pounds each—with them. All agree that the trip from Weaverville to the New River mines can be made in one day on horseback, and one old mountaineer offers to bet that he can walk it in one day over the new trail. The same man tells us it always took him three days to walk from the mines to Eureka.

Tuolumne

SHUT DOWN.—*Union Democrat*, May 16: The Hyde mine shut down a few days ago, but for what reason could not be ascertained. It is said that some disagreement among those managing the property is the cause of the stoppage, and it is also said that the works will be started up again in a few days. Any permanent cessation of work just now, when the property is in a fair way to be developed, is to be regretted. The mine has not been worked enough to make any test of it whatever. It was rumored around town Thursday that they had struck it rich again in the Bonanza mine. Mr. Divoll said, on being interrogated, that if any strike had been made it was "in here" (pulling out a handful of 20-dollar pieces from his pocket). He knew nothing of any strike. He said they were not working where they expected to get gold, but were running a drift to tap a large body of water. "Whenever I ask a man if he's getting gold," said he, "I know he will lie," and we have no reason to doubt Mr. Divoll's word.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, May 16: During the past week the big hydraulic pump has steadily reduced the flood, until, within the last 24 hours, it has subdued it to its former condition, below the 3,000 level. No further breakages of the pumping arrangements have occurred, but preventive measures adopted preclude any further danger from that source. Some tightening and packing of flange connections are being made; also, repairs to the large air compressor, which furnishes the requisite supply of air to the lower levels, the recently submerged drifts have to be cleaned out and put in order again, and to-morrow, or by the first of the week, full work will be resumed on both the 2,900 and 3,000 levels, going ahead with the very promising ore developments at these points, it being two weeks ago Sunday next since this work was interrupted by the breakage of the pump and consequent flooding of the mining depths.

CON. CALIFORNIA AND VIRGINIA.—On the 1,750 level the main lateral drift south is being pushed as fast as the bad nature of the ground will admit. The ore stopes on this level are looking and yielding well, about 40 tons per day being the average extraction. The old ore stopes of the bonanza section, between the 1,550 and 1,200 levels, worked under the Jones lease, are also showing and holding out well. The new gallows frame near the old Consolidated Virginia shaft was raised into position yesterday, and next in order will be the repairs to the sbaft.

OPHIR.—The upraise from the 500 level, to connect with and drain the old Mexican sbaft, is making good progress. As heretofore remarked, all the waste from the explorations of the Mexican and Union Companies, on thier 500 level, and also that of the 1,500 level explorations of the Consolidated California-Virginia Company, is all hoisted through the Ophir sbaft.

ALTA.—Some pretty good spots and streaks of ore have been found in the last few days in the prospecting work about the 950 level. Work was to have been abandoned at that point but for this. The ore is being saved for future reference.

CROWN POINT.—Extracting the low-grade bonanza leavings from the old workings progresses actively, as usual, with no new features of importance to relate.

OVERMAN.—The low-grade ore extraction from the 226 level through the old Petaluma-street tunnel goes ahead prosperously, about 12 or 15 tons being the daily yield.

MEXICAN.—The joint Union and Mexican drift, running north on the 500 level, continues its good rate of advance, about 50 feet per week.

BELCHER.—Nothing new beyond the regular extraction of low-grade ore from the old upper levels, through the Crown Point mine.

GOULD AND CURRY.—The main lateral drift south toward the Savage is being pushed forward at the rate of 50 feet a week.

YELLOW JACKET.—The extraction of ore from the old upper levels goes ahead as usual, with no new points to mention.

BEST AND BELCHER.—The northeast drift from the main north lateral drift on the 1,000 level progresses well, as usual.

KENTUCK.—The old ore stooes continue their regular yield, keeping the Rock Point mill properly supplied.

CHOLLAR.—The water being now out from the 3,000 level, prospecting work is to be resumed forthwith.

SIERRA NEVADA.—Running the main north lateral drift progresses well.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, May 16: The west drift on the sixth level has advanced 12 feet during the week, and the east drift on this level is in 18 feet. The east drift on the fifth level is in 115 feet, and shows more favorable ground for ore. The winze from the west drift on the fifth level is down 97 feet, and shows a small amount of ore. The stope above this drift and the intermediate stope between the fourth and fifth levels, are both looking well. The stope on the third level and west of the shaft is giving some $80 ore from a ledge that is looking promising. The intermediate stope, between the second and third levels and west of the

shaft, shows some improvement. The intermediate, east of the shaft and between the first and second levels, is giving considerable ore from a narrow ledge. The stope, between the first and second levels and west of the shaft, is giving a small amount of ore of good grade. The west drift on the first level is giving some good ore.

Eureka District.

LOCAL NOTES.—*Sentinel*, May 15: The Eureka Star mine sent in a load of ore last Monday. The Bricktop mine continues in the list of ore-producers. The Marguerite mine is making rather large shipments of ore. The Dead Broke mine shipped to the Richmond furnaces recently 23 tons of ore. The Members mine shipped to the Richmond furnaces the other day two tons of ore. The Wega mine in Newark valley sent in two tons of ore recently to the Richmond works. Bad roads are interfering with the ore shipments from some of the neighboring mines. The Lone Pine mine on Adams Hill continues to make occasional shipments of good ore. The Silver Lick is making some good shipments of ore to the Richmond reduction works. The Dunderberg mine continues to look well, and during the past week it shipped 19 tons of ore of good quality. The Colorado mine on Prospect mountain, close to the Silver Connor, shipped during the past week five tons of ore. Reports from the Mount Hope mines are of a very encouraging nature, and those familiar with the property look for a large production of ore this season. The Lord Byron mine, one of Eureka district's most reliable properties, continues its shipments of ore, and during the past week sent to the Richmond furnaces 46 tons. During the quarter ending March 31st, the gross yield or value of the Lord Byron was $28,227.05, and the prospects are favorable for the amount to be considerably increased during the present quarter.

Mount Cory District.

DULL.—Walker Lake *Bulletin*, May 16: Coryville is sleeping a Rip Van Winkle snooze at present, but it will soon wake up. McLaughlin and Cook have been prospecting for a rich gold ledge one and a half miles north of the Big Indian mine, but have so far been unable to find it. There is some excitement in Coon Hollow over the North Star and also over the Snow Bird tunnel, which is in 505 feet, and has struck a ledge of pretty fair rock. The Silver Brick has two men at work and looks well.

Red Canyon District.

ENCOURAGING.—Genoa *Courier*, June 16: News from Red Canyon district continues of the most encouraging character. Messrs. Bradley and Winnie a few days since brought in from that section a specimen weighing several pounds that literally glittered with the precious metal. Alex. Morrison has a quantity of rich rock, taken from his claim in the same neighborhood, in which the gold is easily discovered with the naked eye. Jack McKnight has struck another pocket, which is reported to exceed anything in richness and extent heretofore found in that locality. Altogether the prospects bid fair for a regular mining boom in that district the coming summer.

Tuscarora District.

NAVAJO.—*Times-Review*, May 16: Fair progress has been made with the work on the different levels during the past week. There is no material change to report.

NORTH BELLE ISLE.—Drift north, 150-foot level, advanced 8½ feet; total length, 190 feet. The prospects of finding ore in a short distance are very favorable.

INDEPENDENCE.—Repairs on No. 1 shaft are completed, and the upraise from the 400-foot level to connect with it has been carried up 64 feet. Drift south from cross-cut east, has been extended five feet.

BELLE ISLE.—Drift north, 450-foot level, advanced five feet, cross-cut west, 350-foot level, extended six feet. Have started a drift north on the west lateral 150-foot level. Total length from the line cross-cut, 50 feet. Have suspended work in the south drift from the west cross-cut 250 feet.

ARIZONA.

NOTES.—Clifton *Clarion*, May 16: Capt. Kelly reports the Detroit, Yavapai and Modoc bueno. Capt. Merrie says the daily output of the Longfellow is 45 tons. Mr. Wm. Bonnell last Saturday struck a rich body of gold ore on the claim recently referred to in these columns. J. H. Vaughn, at the Queen, struck a pocket of native copper Monday morning. He is shipping ore from the Queen and King mines. Prospectors hereabouts never were more encouraged than now, and look forward hopefully to the not distant day when capital will create the cheerful glow of the slag and bullion pots, giving employment to thousands instead of hundreds of the men at this camp. The Alaska is continuing to produce rich glance and oxide. Ore has been struck in the second level. The parties who are to buy this property will be here on the 20th of this month. Rails have been laid in the second level, and hereafter it will be the working tunnel of the mine. Friday was the day that the ground was broken on the Morning Star. On Friday gold was struck, and last Friday on the same mine 4 feet 6 inches of excellent gold-bearing matter was exposed on the face of a cross-cut running west. Friday seems to be the day for luck in this mine. The increased output of copper ores from the different mines feeding the Arizona Copper Company's smelters keeps two trains busy hauling it. Copper may go down in the market, but the Clifton district, from the abundant supply stored in her rugged mountains, can stand it if any other district in the world can. As development and improvements are made in the Greenlee Gold Mountain Mining District the more valuable the claims are proven to be. All that is required now are facilities to reduce the rich ores that are daily discovered in order to make Clifton one of, if not, the principal mining district in the Territory. Copper, silver and gold are here in abundance, but it will take time and money to prove it. While at the Longfellow group of mines Monday we learned that the new incline shaft is now down 80 feet. When they sink 20 feet deeper it will be down to No. 3 level where considerable new ore bodies have been uncovered. In the open cuts at the Yavapai the ore shows a good face. About 20 tons of ore are being shipped daily from the Detroit. At this latter mine prospect work is showing up well. The engine and fixtures intended for the incline tunnel have been taken to the Detroit mine, and the horse-power at the Detroit will be placed at the Longfellow incline tunnel. Capt. Harrover will superintend the erection of the machinery. The Captain, after completing the work, intends to go North on a visit. He had intended to go last week, having left the employ of the company, but was requested to stay and place the hoisting works. It looks strange to an observant American that foreign capital is all that is invested in this region to any considerable amount. The Arizona Copper Company, a Scotch syndicate, built the railroad from Lordsburg to Clifton, and the 20-inch gauge road from Clifton to their numerous mines, besides miles of incline railroads, which climb the sides of precipitous mountains where mines have been opened. Yet, with one exception, Americans have not ventured to invest any capital to speak of in this section.

MOJAVE MINES.—*Miner*, June 17: The latest strike on Stockton Hill was made by Wm. Engle on the old Franklin mine, and with a few days' work he has exposed to view one of the richest bodies of ore on the hill. J. M. Gale made quite a shipment of ore from the Moonbeam mine, at Stockton, a few days since. Beecher & Co's teams took back to Kingman yesterday 44 sacks of ore from the Quick Relief mine; and also about five tons from one of Frank Smith's claims, near Cerbat. We have seen some beautiful specimens of ore from the Sunlight mine during the past week. The specimens are covered with native silver in every form and are equal to any we have seen taken from the Lone Star, which has hitherto been considered the specimen mine of the district. The Sunlight mine lies about halfway between Mineral Park and Chloride and is owned by John Barry. Kimble Bros. have quite a force of men at work on the Signal mine on the celebrated McCracken ledge, near Signal. Beecher & Co's teams came into Kingman early last week with seven tons of ore from the Hibernia mine, in Cedar district, the property of Supervisor Raymond. Messrs. Maxson and Jackman shipped a carload of ore last week to the Pueblo Works from the Primrosa mine, in Todd basin. D. W. Grant shipped five tons or ore last week from the Schenectady mine, at Chloride to the Pueblo works. Geo. Mendez has bought one of Steve Smith's claims near Chloride, and has gone to work on it already. He expects to put a number of men at work during the coming summer.

COLORADO.

IDAHO SPRINGS.—*News*, May 15: That grand old treasure vault, Seaton mountain, is turning out more ore than ever before in its history. Ore wagons are constantly passing through our streets, loaded with ore for the samplers, mills, smelters and railroads. Alex. Taylor, an old-time mill man and miner of Gilpin county, will have charge of the stamp-mill here for the Lilly Company. The trains on the railroad are taxed to their utmost daily in bringing up supplies—coal and machinery. Double-headers on most of the trains. Peter McFarlane, the boss builder of Colorado, was over Monday and will commence the erection of Colonel Osbiston's smelter. If capitalists wish to see how mining is conducted and made to pay large profits, let them come to Idaho Springs and remain a few days, visiting our mines, mills and smelters. A double-cylinder hoisting engine arrived this week for the Gum Tree mine. The boiler was hauled to the mine and put in position, and in a week or two work will be pushed upon this excellent property. The Champion-Donaldson mill is running night and day upon the free gold ores of those mines. The returns are very satisfactory and are gaining steadily in value. We understand a strike of excellent ore has been made in the bottom of the Champion mine, on Bellevue mountain. This is one of the largest and best mines in the county, and all it requires is thorough exploring. We understand there will be a consolidation of several properties owned by Colonel Osbiston and his associates, which will comprise several large paying mines, together with a stamp and buddle-mill and smelter. The whole thing will probably be organized into a company, at a very reasonable capitalization, according to the value of the properties. This will be good news to Idaho Springs and will be the means of bringing a large amount of capital to invest in our mines. We shall speak of this more fully later.

SAN MIGUEL BRIEFS.—*Journal*, May 16: The Cimarron will soon commence shipping. John Donnellan has resumed work on the Mendota. The mines of Marshall basin can do but little until the trails are open. Ore houses and dumps are filled and there remains no place to store the ore. Ernest Warner is working his contract on the Smuggler. W. A. Koneman is thinking of erecting a mill at Trout Lake for the reduction of the ores of that district. The Boomerang continues to improve with every foot of development. Monday work was commenced on the Caribou trail shoveling out the snow and opening up trails for burro trains. Work was resumed on the mine Thursday. The Ophir stamp-mill has commenced pounding away on Osceola ore again this week. A portion of the force have resumed work on the mine under lease of Lawsha Bros. It is estimated on good authority that the Silver Bell mine near Ophir, has $12,000 worth of ore on the dump. Frank Morgensen well deserves his handsome pile of wealth. Charles Ward and Steve Gifford have made some valuable discoveries on Summit creek. The ore is a sand carbonate very similar to the Leadville ore, and is found in the same formation as is the mineral at Leadville. It runs well.

IDAHO.

A FINE BONANZA.—Idaho *World*, May 16: Last Saturday morning we took a ride to the Forest King mine. We went into the lower tunnel, followed this tunnel to where it tapped the ledge, then climbed up a raise 100 feet, and then struck out through a drift, at the face of which the vein matter is three feet wide, all good pay ore. From there Ed. Mcriarty escorted us up through a man-way, 15 or 20 feet, and into a stope, where Johnson, who was formerly shift boss in the Banner mine, was at work on a five or six foot body of fine ore. Here the ledge lies almost flat. The vein, in both the drift and stope, is well defined, and the walls of granite are very smooth, look like they had been polished. The ore is soft and easily mined. the vein is large and extensive, and best of all is rich in the precious yellow metal. After a few minutes, we crawled down the man-way, followed the drift some distance east, to an old shaft, sunk years ago, and climbed up through it—about 50 feet—to the upper tunnel, and through this out to the surface. The lower tunnel which tapped the ledge at the depth of 300 feet, is 600 feet long and was driven through the hardest kind of granite. The tunnel was not timbered. Drifts were run quite a distance each way on the vein from this tunnel. The ledge is very wide and carries good ore at that depth. The foot-wall has not been struck. To ascertain the width a cross-cut will have to be run. This 600-foot tunnel was completed about 18 months ago. The raise was then put up to connect with the old shaft, for fresh air, and when the connection was made the drift in which they are now working was started. After stoping out the ore above this 200-foot level, they will go to work in the lower or 300 foot level. They have a large body of ore opened up, and of a class that entitles the Forest King to a place in the front rank of Idaho bonanzas.

DEER CREEK MINING NOTES.—The Montana mine is now producing about two and a half tons of first-class ore per day, which is being shipped the sampler by Clay & Co's teams. P. McMonigie has resumed work on the Sunday Night, and is sacking ore for shipment. The Davitt has not resumed operations this season, but it is reported that the superintendent will arrive from the East shortly. From the Illinois and Nagog, on Panther gulch, Young & Co. are making regular shipments. The Narrow Gauges, since the connection in No. 1, are stoping out large quantities of first-class ore. Up Wolftone gulch Messrs. Erving and Hiller have commenced grading a road to the Cyclops, from which they have a contract to haul a large amount of ore to the sampler. Fred. Kinsley recommenced work on the New Comet yesterday, and will soon have as big a bonanza as any mine-owner on Wood river. All the gulches below the gold mines, near the Comet, have been located for placers, and two companies are already opening up the gronnd. The reporter was recently shown about half an ounce of coarse gold panned out during three days' prospecting by two men.

CŒUR D'ALENE MINES.—Murray *Sun*, May 12: The Myrtle claim in Trail gulch has again broken the monotony in the gold output by sending over to the bank of Murray a 10 ounce nugget. It contains a large amount of quartz, but is very heavy for its size. It is nearly round and no bigger than a hen's egg. J. W. Empfield, of Mullan, reports that the prospects are brightening from day to day, and that new discoveries are constantly being made, but neither their extent nor richness can be determined for some time yet. But the quality of the ore brought to Mullan justifies the most brilliant hopes for the future of the camp. Jack Enright yesterday showed the reporter some very rich gold quartz of a bluish nature which was brought down from a discovery on Reeder gulch in which he is interested. The quartz is thoroughly impregnated with fine gold. One large piece on being broken into three smaller ones, revealed flower gold all through the rock. The find is considered one of the best yet made in the camp.

A ROCK CREEK CLAIM.—As reports of a big strike of ore in the Montezuma mine, at Rock creek, have been in circulation for some days, a *Times* reporter this morning asked Messrs. Pinney and Stevenson, the leasers, if there was anything in the reports? Mr. Pinney said: "Not much. We have shipped 16 tons that assayed 101 ounces, have another 10 or 12 ton lot about ready to bring in, and have about enough in sight to keep going about one month. The ore may last one month and may not. Those are the facts." Mr. Stevenson supplemented the above with the statement that they were working 10 men—all they were allowed to by the lease—and that the claim looked well. The Montezuma is near the Guy, at head of one of the branches of Rock creek.

THE CYCLOPS.—Wood River *Times*, May 14: Eugene O'Callaghan went up to the Bullion divide, yesterday to see the Cyclops, the claim in which Dave Lawrence and Dan Reilly recently opened an ore vein. The openings show from four to 15 inches of solid high-grade galena ore, the length of the chimney on the tunnel level is over 75 feet, there are about 15 tons of ore on the dump, and the owners are getting ready to put in a car-track and begin stoping. They have contracted the hauling of ore to Hailey for $3 per ton, and expect to employ 15 or 20 men all summer.

LAVA DISTRICT.—Wood River *Times*, May 16: The town of Erie, in Lava district, is a rather lively camp, if reports from there are wholly reliable. The camp is prosperous, nearly every prospect showing well from the very surface, and locations are so numerous they almost join for stretches covering section after section of land.

MONTANA.

INDEPENDENCE DISTRICT.—*Inter-Mountain*, May 14: The Little Darling is developed by a vertical shaft, 100 feet deep, from which three levels have been extended east and west on the ledge. The face of the 25-foot level is 100 feet east of the shaft and 30 feet west. The pay streak has a width of three feet, assaying 40 ozs. silver. It is enclosed within well-defined and regular walls. The ore is a sulphuret requiring to be chloridized. The present product of the mine is 25 tons daily, and the force employed is 25 men under the foremanship of Charley McAuliff. The property is provided with a 20-horse-power hoist and a No. 4 Knowles pump, which readily handles the water. The ore has been worked for some time past in the Lexington mill, supplying ten stamps, but the output has so increased of late that ten more stamps will be devoted to that purpose. The Little Darling is owned by P. A. Largey et al., and is now under lease and bond to Bishop et al., who have it bonded for $75,000. Sam Harvey & Co. have a lease on a portion of the Nettie, and are stoping on the south vein at a depth of 50 feet, where they have a two-foot ore body assaying $40. On the Narrow Gauge, Olsen Brothers, the lessees, have sunk a shaft 40 feet deep, from the bottom of which a drift on an ore body three feet wide has been run 40 feet east. The product carries from 60 to 70 per cent manganese and 15 in silver. It is used chiefly as a flux by the Colorado smelter. The shipments are five tons per day. The Brilliant is under lease to Fred. Alverson & Co., who have just begun work. The shaft is 60 feet deep and will be dropped to the 115-foot station before drifting will begin. The ore previously extracted from the mine assayed well in silver and ran high in manganese, making it very desirable as a flux. On the Self-Riser Henry Williams is working a small force in the 50-foot level, from which about seven tons of ore, assaying 15 ounces in silver, and 50 per cent manganese are being daily hoisted to the surface. The Self-Riser is a well-known property and was once a heavy producer of good ore. It needs only development. The Blue Bird, the acknowledged bonanza of the district and one of the most valuable properties in the county, will be fully described in a future article. A dump pile containing 7,000 tons of good milling ore gives some indication of the productive capacity of the mine. The old Burlington mill has been leased or bought by Menary & Billings, and has the promise of an abundance of custom ore. The Bay Horse is owned by Paul Davis, and is under lease to Jim Sterrit who is working seven men. The incline is 50 feet deep, and drifts have been run on a body of clean sulphuret ore two and a half feet wide and carrying 40 ounces in silver. Fifty tons of good milling ore are now on the dump, which is rapidly increasing in size.

VARIOUS DISTRICTS.—Helena *Independent*, May 16: A shaft is being sunk on the Amago lode, situated on Mount Helena, and at a depth of 15 feet shows up some excellent carbonate ore. A new discovery within two miles of Helena was made yesterday, the ore of which shows a large amount of free gold. F. E. Tibbitts has taken up a gold-bearing lode within a mile of the city. The Fargo lode in the same vicinity shows a large vein carrying free gold. Several new quartz locations were yesterday made at the mouth of the Little Prickley Pear. Milo Courtright and E. R. Taudy yesterday bonded of Isabel & Co. the North Star Lode, located on Nevada creek. The bond is for $20,000 and runs for three months. There are Eastern parties negotiating for its purchase. Ed. Delaney arrived in this city yesterday, bringing with him $5,000, taken from his placer claim in St. Louis gulch. It was the result of a three weeks' run. John Keating has made a new discovery on Beaver creek. He has sunk an 18-foot shaft and found a four-foot vein, the assays from the same averaging $400. A number of discoveries have been made in that vicinity and great excitement prevails. S. C. Hudson has made two very rich strikes in the New Helena district, one being a vein of five feet, which assays $83 in silver and $30 in gold; the other, a four-foot vein, assays 56 ounces in silver and 5½ ounces in gold. Mr. J. Clark has also struck a lead in the same vicinity that goes $90 in silver and $30 in gold. The Island Pond lode, situated this side of Montana City, on Jackson creek, is showing up well and assays of some of the quartz made yesterday showed it to be a fine prospect. A rich lead is being worked directly back of the Union Brewery. Reports from Ten Mile district say that the Syndicate company are employing about 75 men and are pushing work ahead at a rapid rate. We are reliably informed that all the mines bonded by the company will be taken up.

OREGON.

WATER LOW.—Jacksonville *Times*, May 16: Water is getting low at the mines of Wimer & Sons and Deselles & Connell. The Enterprise Mining Co. of this place propose going down still deeper on their ledge. M. F. Knapp, an old prospector, has located the quartz ledge formerly worked by Sam Bowden and others on Jackson creek and will thoroughly prospect that region. Keaton & Klippel, of Poorman's creek, have suspended operations, but will probably open a drift this season. They were unable to clean up, owing to the scarcity of water.

UTAH.

WATER.—Park *Record*, May 16: The Crescent mines are troubled a great deal with surface water this spring. The nature of the soil is such that it absorbs all the moisture on its surface, and there have been a great many days of warm melting weather and the water has come into the workings of this company to such an extent as to cause a suspension of operations for a week or two, and the discharging of about thirty men. Of course this will not affect the shipments of first-class ore as there are said to be about 500 or 600 tons in the ore-house, which will be shipped as soon as the canyon roads are open. Neither will this exceeding moisture conflict with the shipments of concentrates as there is a great quantity now at the mine ready for shipment and coming down daily.

REVIEW.—Salt Lake *Tribune*, May 18: The receipts in this city for the week ending May 13th, inclusive, were $66,054.03 of bullion and $21,460 of ore, an aggregate of $87,514.03. The week previous the receipts were $95,632 58 in aggregate, of which $82,572.58 was bullion. The Ontario sent in during the week thirty-four bars of bullion, of the value of $21,714.03, bringing its output for the present year to $622,721.54, from which $300,000 in monthly dividends of $75,000 each has been paid. The mill will start again after the clean-up with renewed vigor. From Tintic we have had during the week sixteen bars of Riter bullion, valued at $13,000—a new and pleasing item in the shipment reports. The silver sandstones have yielded $5,950 during the week, of which the Christy sent up two silver bars, $3,100, and the Stormont two silver bars, $2,850. The product of the Hanauer smelter has been for the week nine cars of bullion, $21,500.

MINES OVER THE RANGE.—A gentleman in from Ophir reports that camp, Dry Canyon and Stockton are all looking up. Considerable work has been done during the past winter, and as soon as the snow-drifts in Ophir are melted, several shipments of very good ore will be made. A number of leases have been made of old properties on Lion Hill, and flattering results are expected. More work, it is said, will be done in that camp this season than during any time for a number of years past. The same is true of Dry Canyon and Stockton, the mines in both of which camps will make a handsome yield for 1885.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual confereuce of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any othe Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutraliz the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high-mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

☞ SUPERIOR TO BLACK OR JUDSON POWDER. ☜

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

218 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengtbe as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine. and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

New Mexico Notes.

[From our Traveling Representative.]

A steam drill is now used in the Old Man miue at Fleming.

Tbe new mill of the Peacock mine at Cooney is nearing completion.

The Mimbres mill at Georgetown is producing about $1,000 per day in bullion.

A carload of ore from the Malone group of mines was shipped from Lordsburg last week.

Experimenting is still the order of things at Col. Carpenter's reduction works at Silver City.

The well-known civil engineer of Tombstone, J. G. Parke, is now interested in mines at Gold Hill.

Lordsburg is so situated as to be the shipping point of a number of substantial mining districts.

Tbe Ownhy house, at Lordsburg, should have been called the Mining Exchange. It is the headquarters of miners and mining men.

Prospects in Grant county and along the line of the A. & N. M. railroad, between Lordsburg and Clifton, have brightened up quite briskly of late in mining interests. The road now runs two trains per day and an occasional extra.

A reliable and trustwortby paper in a mining district is like a good mine. It is invaluable to community, and the home protector of the patrons of the district who reside elsewhere. The Silver City *Enterprise* is one of these kind of newspapers.

San Francisco capitalists have an eye on Grant county, New Mexico. The recent activity shown in her excellent mines have attracted the attention of men who are authority on mining, and a number of them are seeking investment in Grant county. Pacific Coast capitalists are quite numerous at present in this vicinity.

The Nugget, in East Carlisle district, has one of Baker's mining horse-power hoists on it. The machine has proved itself to be "a dandy," to use the expression of miners wbo witnessed its workings. Such machinery is peculiarly adapted to prospecting a mine, and does away with the expensive stamp power usually resorted to by many men whose imagination in the start is bigger than their mine.

A well-to-do Eastern man said to me a few days ago in mentioning an Eastern company's property that was paying good dividends: "You Californians and Western men will not believe a property can be made to pay by Eastern men; now what do you think of our property?" "Who is the superintendent of your mine?" I asked. "Mr. So and So," answered the Easterner. "Where is he from?" I inquired. "He's from Nevada—excuse me, I want to see that man across the street," hurriedly added the capitalist as it dawued upon him that his management was anything but Eastern.

Unusual activity prevails in the Gold Hill district, 12 miles north of Lordsburg. Two mineral belts, one gold aud the other silver hearing, rnn parallel to each other, but a short distance apart. The formations are porphyry and granite, with some shale and lime. The silver ores carry a little lead, the silver occurring in different forms. Tbe gold ores are a free-milling quartz, showing more or less free gold. No depth to speak of has been reached, but so far as prospected the showing has been excellent, especially so as to the gold belt. The results of mill-runs and assays show the ores of the camp to be of a low grade, but of such a character as to be easy to treat and not difficult to extract in large quantities. A scarcity of water is tbe camp's greatest drawback just at present. The large number of practical miners now prospecting about Gold Hill bids fair to open up a number of good properties duriug the present season.

In few districts are the various ores as hard to treat profitably as tbose of the Carlisle. The use of the most improved machines are necessary. No company has spent so much money to bring about a successful treatment of their product as the Carlisle people. It will be of interest to mining and milling men to know the results of their expense and practical experiments with many machines. The Duncan concentrators proved to he the most successful as well as the least expensive in haudling the ores. The enviable reputation these machines have in this vicinity speaks well of mining meu's appreciation of fine machinery. A detailed description of the workings of the "Duncan" would no doubt be of interest to our readers, but as such would take too much space to do justice to the machine, and I don't happen to be selling concentrators at present, I will refer those who are interested to the Pacific Iron Works of San Francisco, who no doubt will be glad to forward any information on the subject asked for. There is talk of a number of other mills similar to tbe Carlisle going up soon in Grant county. F. W. S.

Mining Share Market.

Notwithstanding the lack of bonanzas on the Comstock just at present, that mining seetion still controls the share market in this city, and the progress of development in the principal mines there gives the key to prices here. The recent flood of hot water in the lower levels of the Hale and Norcross, now drained, did not seem to effect the market here mueh, strange to say, whieh is rather an evidenee that there are strong hopes among dealers in mining shares that something good will be developed in that mine. As the *Enterprise* well says, the Hale and Norcross would seem to be the tap-root, so to speak, of the Comstock mining situation. Deep mining has been prosecuted heretofore all along the lode, but this is the deepest bonanza prospect yet found. All surrounding and inclosing regions, geological and mineralogical, show a strong concentration from all sides toward that one point in the matter of depth. The deepest root of the Comstock tree seems to strike down right there, and there may be found the rich, nutritious bed of wealth from which has proceeded the ripened bonanzas found and worked in the uppe branches of the grand old tree in times past. These productive branches have reached to the surface to the north in Virginia City and south in Gold Hill, and their fruit has been bullion millions. Future developments alone may tell what shall be found materialized away down among the bullion roots of the fruitful old Comstock tree.

The daily output of ore from the north and south braneh es continues and somewhat increases, and in the sweet by and by perhaps the low-grade ore resources of the middle section may be brought into active requisition. The Comstock lode constitutes the foremost mine of the world to-day, notwithstanding its redueed production. Hundreds of millions have been taken from it, and there are yet hundreds of millions in it.

RANKIN, BRAYTON & CO.,

...BUILDERS OF....

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	109 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

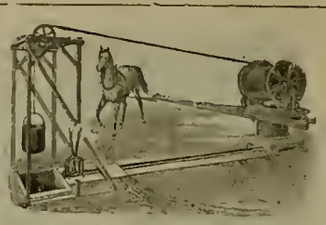
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

HOISTING WORKS.

List of U. S. Patents for Paoific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING MAY 12, 1885.

317,701.—REVERSIBLE HINGE—J. F. Aston, Watsonville, Cal.

317,706.—CAR AXLE—Geo. W. Bedbury, Portland, Or.

317,619.—CABLE GRIP—W. A. Burke, S. F.

317,621.—ORE CONCENTRATOR—N. Butler, Enniss, M. T.

317,637.—DEVICE FOR REMOVING NUTS—P. G. Gesford, Jr., Napa, Cal.

317,793.—LAYING ARTIFICIAL STONE, ETC.—P. H. Jackson, S. F.

317,551.—TULE BUNCH MACHINE—C. Leduc, Stockton, Cal.

317,556.—HORSE HAY-FORK—C. Maginnis, S. F.

317,573.—ELEVATOR LIFTER FOR THRESHERS—W. J. Pulliam, Chico, Cal.

317,577.—WAGON-JACK—J. T. Reid, Reno, Nev.

317,872.—SHIRT—W. M. Spence, Carson, Nev.

317,590.—R. R. STATION SIGNAL—A. A. Sprague, San Rafael, Cal.

317,687.—PATTERN-MAKING MACHINE—C. Tourigne, S. F.

317,894.—CAR-COUPLING—A. W. Van Dorston, Portland, Or.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HORSE HAY-FORK.—Christopher Maginnis, S. F., No. 317,556. Dated May 12, 1885. This improvement in horse hay-forks consists of a tubular head for the fork, a means for receiving the fork tines to the head, and the frame by which the fork is suspended latched to retain its load, or unlatched to discharge it. The fork is made light and strong, and the head is supported from points near each tine, so that it is impossible for it to bend or sag out of shape by reason of the weight of the load.

DEVICE FOR ADJUSTING AND REMOVING NUTS.—Preston G. Gesford, Jr., Napa. This device for setting up and removing nuts is intended especially for those upon the ends of axles of vehicles; and the invention consists in a means for readily establishing a temporary connection between the nut and hub of the wheel, whereby upon the movement of the wheel the nut will be rotated to set it up or remove it. The invention further consists in a swinging link or loop pivoted to the nut and adapted to be engaged with the hub in a peculiar manner, so no monkey-wrench is necessary to remove the nut.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

BY TELEPHONE.—Subscribers, advertisers, and other patrons of this office can address orders or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

NEW BOOKS ON ASSAYING.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with Illustrations, well bound in cloth: 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II and III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion: Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zantbat; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, $1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

POSITIVE FACT—Muller is the leading Optician. Depot 135 Montgomery street, near Bush, opposite Occidental Hotel.

W. E. CHAMBERLAIN, JR T. A. ROBINSON.

PATENTS. Thousands of Inventors throughout the Pacific Coast can and will willingly attest to the promptness, reliability and success of Dewey & Co.'s U. S. and Foreign Patent Agency. No. 252 Market St., Elevator 12 Front St., S. F.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The **genuine** has stamped on every sheet **"Jenkins Standard Packing,"** and is for sale by the Trade generally.

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Manufactured only by
JENKINS BROS., 71 John St., New York.

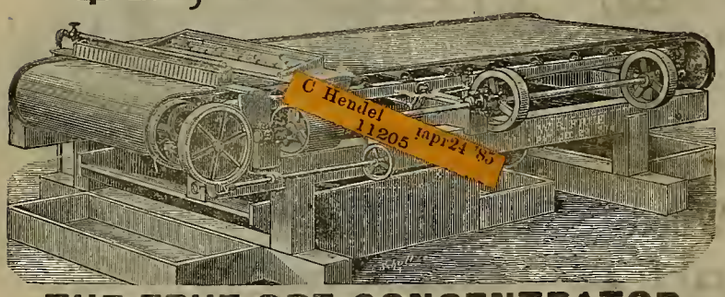
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

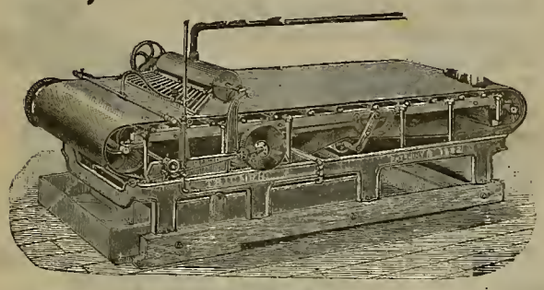
Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street. - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "**Triumph**" **Ore Concentrators** and the same number of "**Frue**" **Vanning Machines**, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $109.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company; in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000,** flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

A. T. DEWEY. W. B. EWER. GEO. H. STRONG } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 262 Market St., S. F.

VOLUME XLXX
Number 22.

The Factory System.

In nearly all industries where raw material can be converted into finished goods by consecutive harmonious processes, carried along by a central power, the factory system has been adopted. In all textile manufactures this has been the case, and the adoption of the new system in the woolen, silk, worsted, flax and all textile trades, followed immediately upon the adoption of the system in the cotton trade. Outside of the textile trade the extension of the system has been rapid indeed, until the statistics of industries of the United States and Great Britain are simply those of manufactures under the factory system.

This statement is in the main true of Belgium, France and Germany; although in France a very large proportion of weaving, especially of fine goods and silks, is still done by hand; in the silk industry in France, however, the power-loom is rapidly displacing the hand-loom. Notwithstanding this general adoption of the system by textile trades in the great manufacturing centers of Europe and America, more than one-half the population of the globe is clothed with hand-made goods.

The system has been more rapid and more varied in its application in this country than anywhere else. As parties engaged in other industries saw the wonderful results of systematized labor in the making of textile they gradually adopted the new order, until now of the nearly three millions of people engaged in the mechanical industries of this country about four-fifths are working under the factory system. Some of the other remarkable instances of the application of the system are to be found in the manufacture of boots and shoes, watches, musical instruments, clothing, agricultural implements, metallic goods generally, fire-arms, carriages and wagons, underwear, rubber goods, etc. Most of these industries have been brought under the factory system during the past thirty years.

It is comparatively few years since the manufacture of boots and shoes was carried on in the little home shops which were attached to or built near the dwellings of the shoemakers. These little shops, in which a few men worked upon the bench upon stock received from the manufacturer cut out and ready to be put together, are closed and the great shoe factory takes its place. In the shoe factory is to be seen the perfect adaptation of the manufacture of goods by successive harmonious processes. The watch factory presents the most completely scientific application of the factory system, and has brought the watch within the means of the poor man. Pianos, house organs, tapestry carpets and many other luxuries are now used by the masses as the result of the factory system of industry.

The instances referred to indicate the vast extent of the application of the system. If they do not, the figures furnished by the census reports, which show that the product of the industries of the United States has reached $6,000,000,000 per annum, will illustrate the extent of its growth. The same authority states that it is quite impossible to arrive at an accurate statement as to the number of persons it would require under the old individual system to produce the goods made by the present factory workers of this country, but by careful computations in some branches of work a rough estimate of the whole would indicate that each factory system employe in 1882 represents on an average at least 50 employes under the individual system. Then it would require about 150,000,000 persons working under the old system to produce the goods made by the three millions or so factory workers of to-day.

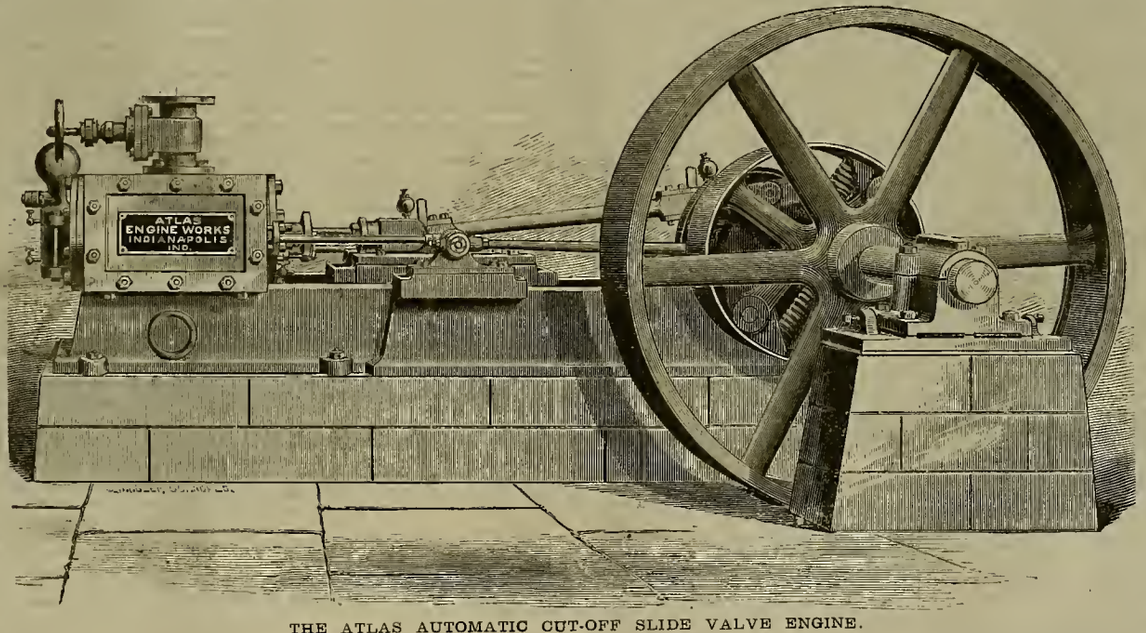
THE MINT STILL OPEN.—An impression has obtained that the Mint in this city was closed. This is not correct, as it is still open and ready to take charge of all the bullion which may be sent for refining or coinage purposes. The superintendent of the Mint has instructed by the Director of the Mint at Washington to cut down his force, and this will be done to the lowest limit compatible with efficient service. It is expected that this order will let out about one fourth of the employes. The Mint is generally closed some time in June for the annual clean-up, and the present year will probably be no exception to this rule. Due notice of the closing of the Mint for this purpose will be officially given at the proper time. The clean-up will delay operations only for a few days and will inconvenience no one.

The Ætna quicksilver mines in Napa county have shut down.

The Atlas Automatic Engine.

The engraving on this page represents one of the improved automatic cut-off slide-valve Atlas engines. The advantages of working steam expansively are well known. The points gained by the automatic cut-off over the plain slide-valve engine with throttling governor are briefly stated as follows: Higher average cylinder pressure, and consequent gain in power for the same boiler pressure; employment of the expansive force, or the use of steam otherwise thrown away in the exhaust, and regularity of motion.

For this engine, a slotted eccentric loose on the shaft, controlled by a shaft governor, operates the valve. The governor weights, moving to or from the center, locate the eccentric on the shaft, and thereby increase or decrease the supply of steam according to the load, and maintain uniformity of speed. The springs simply hold the weights in position. The dash pots prevent sudden changes. This engine is economical and effective. H. P. Gregory & Co., of this city, are agents for this Coast. All parts of the engines are built on gauges on the interchangeable system. The bearings are large and carefully fitted, and good material and workmanship are put in. These engines are made from 10 to 147-horse-power.



THE ATLAS AUTOMATIC CUT-OFF SLIDE VALVE ENGINE.

Miners hope that sampling works will soon be established at Prescott, Arizona, as they wish to sell small lots of ore. They are not prepared to ship carload lots, but they could keep a sampler in business. Regular reduction works would, of course, be preferable, but as they could not hardly be successfully operated without railroad facilities, sampling works are what they now want.

THERE are 12,973 newspapers published in the United States, a gain of 823 since 1884. Kansas shows the greatest increase, her gain being 78, Illinois coming next with 77. One newspaper is now printed for every 3,867 of population.

Steam-Engine and Boiler Practice.

The *American Engineer* of Chicago has issued two works, by Chas. A. Smith, C. E., both of which are very useful for all users of steam. One is entitled, "Steam-Making or Boiler Practice," the other is "Steam Using or Steam-Engine Practice." They are illustrated, well printed and serviceably bound.

These two books, companion volumes, represent the work of the closing days of the life of the late Prof. Chas. A. Smith. The books are characteristic of the author, being practical treatises for practical men, stating in a short, clear way the points to be avoided and those to be recommended in the design of boilers and engines to give a maximum efficiency and economy in the making and use of steam. The chapter on "The Nature of Heat and the Properties of Steam," which appears in both books, contains a valuable table of the properties of saturated steam based on the pressure instead of the temperature of evaporation, as is usual, and the use of the table is explained in the author's favorite manner—by example. The chapter on "Combustion" which appears in "Steam-Making," is short, but the difficulties in the way of obtaining the full evaporative value of a pound of coal are clearly stated and valuable suggestions made. This chapter contains a tabulated record of over 650 boiler trials. The Professor takes up the different classes of boilers and discusses their good and bad points with characteristic impartiality. In "Steam Using" the chapters on "Valve Gear" and "The Quantity of Steam Which Might Be and Which Is Used" will be found of value to practical men, but particularly good is chapter V, which contains an account of the experiments of Messrs. Hirn and Hallauer, translated from the French. The Professor leaves open the much-debated question of the economy of compounding, for want of sufficient experimental data, but inclines to the opinion that for quick-running, high-pressure engines little or nothing is to be gained by compounding; but that for such engines, judging from the experiments of Messrs. Hirn and Hallauer, it is best to use a single cylinder unjacketed engine with superheated steam. The books contain acute and short descriptions of most of the successful patterns of boilers and engines now in use in this country and Europe. There are a good many typographical errors in both volumes which should be corrected in future editions.

Mr. Schlund took about $3,000 out of a small pocket in the Tiger mine, near Rich gulch, Calaveras county, recently.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The True History of the Arnold-Slack Diamond Plant.

EDITORS PRESS:—As certain New York papers have lately shown a disposition to revive the memory of the ill-famed diamond fraud perpetrated on this community some thirteen years ago, seeking to connect the names of Messrs. Roberts and Harpending therewith in an odious way, it may be well to info m the public that both of these men have, by ths almost unanimous verdict of our people, heen acquitted of any discreditable ageucy in that business. I will not here give a detailed history of that miserable affair, nor even recite more than a few of the reasons on whicb this verdict is founded. The purpose of this writing will, in fact, be served by a single statement, which fully explains bow Messrs. Roberts and Harpending came to be at all connected with the originators of the swindle, and how they came to be victimized by them.

These gentlemen, as well as Arnold and Slack, were Southern meu, being all natives of Kentucky. The extent to which persons from the South arc apt to confide in the honor and integ. rity of each other is well known. The word of a friend or associate is never questioned. Any statement made by them is accepted and acted upon as truthful and reliable, a man's word being considered as binding as his written obligation. This sentiment, so prsvalent in that sectiou of the Union, had in the case of these parties been strengthened by a mining partnership running through a uumher of years, during which mutual confidence and good feeling had been preserved all round. Many thousand dollars had been entrusted to Arnold and Slack to be sxpended by them in prospecting for, locating and working mines on joint account; a service which they had always performed to the satisfaction of tbeir partners, who had, in fact, ever found them in all respects truthful and trustworthy.

Little wonder, then, when these men returned, after a long absence in the mountains, and reported a great diamond find, that their unsuspecting partners should bave given ready credence to all they told them, previous rumors of the existence of precious stones in the regions visitcd by these bardy prospectors lending plausibility to tbeir cleverly concocted story. The readiness with which Harpendirg and Roberts consented to have tbeir stock locked up pending further investigation of the matter and aided in sending out a party to more carefully examine the ground and inquire into the reported find, shows bow thoroughly they believed in its genuineness and that everything was being conducted on the square. Had they themselves put up a job of this kind, they would have heen pretty sure to make money out of it; not being men likely to be caught in their own trap, however, they may in this instance have been trapped by otbers. The truth is, no set of men connected with that nefarious business suffered so much as Harpending and Roberts, they having been badly damaged in purse and, for tbe time being, injured in reputation as well. Out of their diamond shares these men could have cleaned up a million or more. That they failed to do so, and even sustained heavy loss, proves tbat they were in no way implicated in the fraud. Finally, I may say, that I know of my own knowledge that I have in tbe foregoing explanation. furnished the key to their blunder, Mr. Janin, the cxpert, having, through the same sort of misplaced confidence, been thrown off his guard and betrayed into a mistake that otherwise would not have occurred.

HENRY DEGROOT.

San Francisco, May 21, 1885.

MANGANESE.—A number of years ago traces of manganese, a metal used in steel-making and mining, were found on the ranch of C. A. Ellis, near the Livermore coal mines, seven miles southeast of Livermore. Samples were assayed, ranging in richness from 30 to 60 per cent, but no further action was taken in the matter. Some three weeks ago, bowever, John Taylor, senior member of the firm of John Taylor & Co., wholesale dealers in miners' supplics, of San Francisco, came up to Livermore to look up a supply of manganese, for which be has an active demand. A trip was made to the place and the lode examined, a sack of sample rock being taken to the city for assay. Tbe rock selected was below the average in sight, but assayed thirty-six per cent—a result whicb justified Mr. Taylor in ucgotiating for the use of the mine. He therefore contracted witb Mr. Ellis for the right of working the lode, making a contract for five years, in which he agrees to pay a royalty on all ore taken out. There are but two wholcsale dealers in manganese in this State, John Taylor & Co. and Justinian Caire, tbe latter being the owner of the old Ladd mine in Corral Hollow, from which many thousand tons of metal have been taken for bome use and shipment to England. Messrs. Taylor & Co. are now equally as well provided with a supply, while their mine is much better located as regards ease of transportation.—*Livermore Herald.*

Working Ore at the Freeland Mine.

The Idaho Springs (Colo.) *News* gives an article on the Freeland mine, from which we make the following extract:

"The Freeland mine has started in as a steady dividend payer. The property is making a net profit each month, over and above all expenses, of $12,000 to $15,000. Considerable has been said from time to time about wby this great mine did not pay divideuds before; but when we take into consideration the various reasons it sets to rest all questions of the whys and wherefores. First, for a few years back the mine was paying to the railroad company most of their profits in freight. Several conferences were had with the railroad officials, but witbout success in obtaining reduced rates. The manager, Colonel Osbiston, came to the conclusion to close down the mine—all but development work—and over 200 men were discharged. Things went along in this manner some months, until Mr. John M. Dumont, of Idaho Springs, a well-known mining man, built a smelter and took a year's contract to smelt the Fresland ores, which had been accumulating for nearly a year, and the undertaking proved so successful that the manager negotiated for the purchase of the smelter at once. This necessitated almost a total closing down for several months, until Mr. Dumont had worked up the surplus ore, when the works were purchased by the Freeland Mining Company, which necessitated a large outlay of money. At the sams time large engines, air-compressors and boilers were purchased and sinking upon the vein commenced and continued for a year or more; levels run, stopes started and everything put in readiness for a large production. A large outlay of money attended all tbis. Tbis is exactly the standing of the Freeland mine up to a few months ago. They have been producing largely, and after paying all expenses have put in the treasury $15,000 each month for dividends. Tberc are $80,000 ready to pay them. The ground opened up at present, if not another foot of development work is done, will run the company for two years at least, but drifts are being run ahead, day and night, and new ground opened up. Whils the average yield of its ore is less per ton than in many silver mines, the great width, uniform tendeucy and seemiugly limitless extent of the mineral body entitle it to a place in the front rank of the best of mines. The vein is mainly composed of copper and iron pyrites, with occasional bodies of nsarly pnre galena, carrying 65 per cent of lead and about 50 ozs. of silver. Nearly 90 per cent of the product is in gold, the remainder heing credited to the silver and cop per. From 1 to 3 per cent of the ore is composed of the latter metal. The ore is usually in the shape of a vein of copper-iron, rich enough to ship to market, flanked by poorer material and mixed mineral and gangue. The poorer grade requires concentration, from two and a half to tbree tons heing dressed down to one of salable mineral. Over one-third of the ore goes to tbeir smelter without separation. The cheapness with which this great vein can be worked is remarkable, and combined with its great size, renders it extremely profitable.

Owing to a scarcity of water the large mill for concentrating the orea of the Freeland mine only runs twelve hours a day. This is one of the best and largest mills of the kind in tbe State. Here the valuable mineral is separated from the gangue or waste rock, and from two and a half to three tons are concentrated into one, at a cost of less tban 70 cents a ton. The building is 117 feet long by 62 feet in width, and is divided into three compartments. Tbe ore comee direct from tbe mine, through tbe Freeland tunnel, into tbe ore-room. Here it is screened and tbe coarse portions sent through Blake crushers and Cornish rolls. It is then elevated to tbe receiving screens and sized, all of the coarse particles being passed back to other rolls, which crnsh to the desired sizes. The crushed material continues on tbrough a succession of cylindrical sizing screens to tbe last jigs, and is then ready for the smelter. Thesc jigs, of wbich there is a large number, are inclined wooden troughs, bottomed witb wire screens, through which water is constantly forced upward by the aid of a plunger worked hy an eccentric, thus lifting and keeping the ore and pulp in motion. By this means the heavier portions, containing the valuable metals, gradually work their way to tbe bottom, while tbe lighter, or non-mineral matter, are carried away by the flow of water. The former are called concentrates, and vary from the fineness of sand to the coarseness of wheat kernels. The jig-room occupies much of the larger part of tbe building. Steam power is afforded by a hundred-horse-power engine, driven by twin hoilers, located in a room set apart therefrom. The entire structure and its contents are of the most substantial character. Just above this mill, say one-balf a mils, is the smelter. This is constructed on the same plan as tbe works of the Boston and Colorado Company, at Argo, with the exception tbat they do not refine their own hullion, but only matte the ore; that is, they put so many tons of ore in one ton of copper matte, and this ie sold to the Argo works. The average value per ton of the matte will probably be from $700 to $900. The smelter covers an area of over an acre. There are two matting furnaces, five calciners, nine roasting kilns for desulphurizing coarse ore, two Dodge rock-breakers, two sets of Cornish rolls and screens. The works are run by a 35-horse-power boiler and engine. Tbe whole works are covered by substantial buildings, roofsd witb corrugated iron. There are 800 cords of wood consumed each month. Ths assay office is the most perfect of its kind in the State. Few mines are as closely tested as the Freeland, and few managers are as correctly informed of the true value of their ore product and resources. Every fathom of ground is examined by practical miners and experts of the company, and their invsstigations and assays tell to a certainty the kind of ground tbe levels and stopes are penetrating.

Here is a little world in itself. Scores of msn have employment, and with their families have built a town of over 500 inhabitants, witb storss of all kinds, school-houses and saloons, which go toward making up tbe clement. Here is a sermon for some philanthropist to work upon. What is the use of men wasting their breath in lecturing and writing books when a few gentlemen can take bold of a mine and, by expending money upon it, do good toward their fellow-men? There are plenty of mines around Idaho Springs whicb would make equally as handsome records had they the same amount of dsvelopment as the great Freeland.

English and Foreign Miners.

While on the question of efficiency, as estimatsd by the quantity of coal got, I will point out what I bold to be a fallacy in an argument founded upon it that is often put forward to serve a purpose. It is a commonly accepted opinion—at least in England—that the English miner is the most efficient workman; in other words, the labor of the English miner is more productive tban that of any other. To prove this, figures are appealed to, and if these alone can settle the question it must be admitted tbat the case is clearly made out. The statistics of production show that tbe English miner gets more coal in a year than any one of his Continental brethren. The next in this order of merit are the German, the Belgian and the French. Regarded solely from the point of view of coal production, the conclusiou is true, and so far an argument founded on it is valid. But usually it is employed to prove one of two things, either that the Englisb miner is capable of performing much more work than his Continental neighbors, or, whicb is only another view of the same thing, that the rate of wages in England is not really higher than the rates abroad, because it amounts to no more per ton of coal raised. Now, I maintain that the figures, which undoubtedly show the miner's productiveness in coal raised, do not exhibit his efficiency in work performed. The conditions in every coal field are different, and the conditions of the Continental deposits differ widely from those under which the English seams have to be wrought. The measures are frequently higb pitched and much disturbed and dislocated. The seams are frequently thin, or if thick, divided by dirt partings. The amount of "stone-work" in a Continental colliery is usually far greater than in an English mine. These and other influences of a like character operate to diminish the output of coal per man by rendering a large proportion of unproductive labor necessary. This work docs not appear in the statictics I have alluded to, but it is performed, and ought, of course, to be paid for. If the men could he compared hy the amount of work done instead of the quantity of coal got, the differences would appear much less than they do in that very ins ructive table lately published by Mr. Jeans. It may be that the order of merit would not be disturbed, but the differences would be notably lessened. Tbe Continental miner is a more ahle workman than he appears to be when judged by this false atandard.

Another error often fallen into in comparing English with foreign miners is to assume the manner of payment for labor the samc everywhere, an unwarranted assumption which makes the remuneration of the Continental miner appear less than it actually is. It is the custom all over the Continent to pay partly in kind. The miner ia provided witb a neat, comfortable and wholesome cottage and a good garden, sometimes free, but oftener at half-rent, and he is allowed as much coal as he needs for his own use. Bssides these, free schools and libraries are established and maintained mainly at tbe cost of the employers, who also contribute largely to tbe cost of medical attendance. Otber advantages there are, too, of the nature of pensions in some cases. All tbese must be taken into account when comparing the wages paid in money per week or per ton witb the wages of the Englisb miner for whom these advantages are not provided. It should be borne in miud also that these payments in a form other than that of wages do not vary with the fluctuations of trade. The importance of this fact makes itself felt in times like tbe present, when the state of the coal trade renders repeated reductions necessary. On the whole, the Continental miner, with his lower rate of wages, is better off than his English neighbor, whom he is apt to envy when he reads of so many sbillings a week more received. —*Cor. Colliery Guardian.*

Skilled miners are said to be leaving the Wood River country since the reduction of wages to $3.50 per day. They say even if they cannot get better wages in other places, the accommodations will be better and the surroundings preferable.

The Slate Formations.

The most casual observer cannot fail to notice order and design in the grouping and arrangement of rocks as they are expossd to tbs earth's surface. Soms of tbese sxposures suggest a building process on an elaborate scals. Sometimes, though rarely, ths exposure resembles a vertical wall—one layer of rock above the other; more often the structure is tilted or entirely upset, and apparsntly strewn at intervals on the surface, though still showing in many cases the same regular order. Sometimes the regular has tbe appearance of a solid mass, with no parallel dividing planes. These massive rocks underlie the otbers and constitute the first or foundation rocks of the eartb's structure. If all these rock exposures could be restored to tbeir original position, according to tbe order in respect of time in which they were formed, and the intervals properly filled out, the surface structure or crust of the eartb as far as can be studied and examined, would pressnt an upright pile of about fifteen miles in hight, with ths solid massive rocks which geology designates by tbe term "unstratified," at the bottom, and more regularly arranged layers or strata—and therefore called stratified rocks—above these. The former are also termed "igneous" rocks, on account of their origin being a consolidation from a fused or semi-fused condition, and having a crystalline or glassy appearance, which is tbe result of heat. The stratified rocks ars so called because divided into sheet-like masses called strata, and also termed sedimentary, being consolidated sediment, originally deposited by the agency of water at the bottom of some lake or sea. These strata are divided into groups, and subdivided into layers or beds and laminæ and distinguisbed by the remains of former life discovered in them, and hy a difference in mineral composition, more or less peculiar to each group. The various groups of strata are known by names which ars derived from ths mountains, lakes, rivers or towns, near which the gronp of strata are best developed and where they have been originally studied, as, for instance, the Huronian, Potsdam, and Niagara rocks. Some are named after their distinguished mineral-bearing characteristics, as tbe Carboniferous Limestone, ths Coal Formations, and tbe old and new Red Sandstone.

All ths stratified rocks are originally in a horizontal position. The tilting, folding and elevating process, which placed them in their present shapes and positions, were caused by disturbances, the result of earthquakes and volcanic eruptions brought about by the cooling off and contraction of the surface crust. It is evident therefore that highly plicated rocks, wben in the formation at the bottom of ths lakes or seas, extended over a mucb larger area, and lay at a much lower elevation.

The process of folding and tilting was accompanied by rising to higher elevation. Afterward came a process of crosion by floods, glaciers, and the elements whicb cut off and rsmoved the arches, filled up depreseions, cut out river channels and exposed the rock etructure as it is now found, thereby enabling tbe geologist to carry his investigation to a nepth of at least fifteen miles. Without tbese disturbances such investigations would necessarily bave been confined to very narrow limits, the science of geology limited in its scope to a few hundred feet of rock formations at most, and the valuahle metallic and mineral deposits which for ths most part are not found in the more recent formations, would bave forever remained lost even if the earth under such circumstances could have become inbabitable for man.

The older rocks, those located at the bottom of the geological pile, are called Archæan, or ancient rocks; the term Azois, meaning without life, was formerly applied to these rocks, but since the discovery in them of evidence of a very low form of life, called Eozoon, the term Eozoic is recognized. The Archæan or Eozoic rocks are subdivided into several groups, which it is not necessary to enumerate in detail. The principal and typical rocks of this period are granite, syenite and schist, the constituent minerals are mainly quartz, feldspar, mica and hornblende. The entire extent of their distribution is limited probably to not more than one-tenth of the earth's surface, but heneath they are supposed to constitute tbs great mass of the earth's crust.

The stratified or sedimentary rocks arc distributed over about nine-tenths of the dry land, and they cover tbe wbole of tbe sea bottom. They are represented by the sandstones, grit stones, conglomerates, shales, slates, chalk, limestones, marble, muds and clays. Ths formation of rocks and rock structure is in process at the present day; stratified rocks are being laid down in all lakes, estuaries and seas, and unstratified or igneous rocks are ejected from volcanic centers. And since the forces by which old rocks are wasted and new ones reconstructed from tbe debris are enduring the geologist is entitled to ascribe the formatiou of the rocky crust to the operation of similar agencies in former periods.

In this way land and water have been gradually but continually changing places, and the rock matter formed during each period is not only the record of these changes, but an indication of the physical aspect of our globe at the successive stages of its history.—*Slate Trade Review.*

MECHANICAL PROGRESS.

A Silver Piston Gland.

A machine making company in New York City havo made quito a nnmber of heavy engineo for the mining districts of Mexico and South Americe. The machinery was peculiar, in tho fact that every piece had to be made in sections light enough to be carried on the back of a mule. Some difficulty was encountered at first in getting cylinders made up into a dozen sections, but it was a new caee of difficulty being the mother of invention, and was succeefully accomplished. When the mules are winding their way along the defiles of mountain fastnesses with part of a steam-engine on their backs, they occasionally slip over a precipice, and the section ie lost or destroyed; but each part is made to interchangeable sizes, so in such a case the nnmber of the lost piece ie eent to the maker and a substitute is forwarded to take ite place.

Tho machinists who go along to put these engines and machinery together have some trying calls upon their ingenuity to make temporary substitutes for missing pieces.

We hear of a case where the stuffing-box gland of the cylinder was found to be missing when tho engine was put up. They were anxioue to etart up, and the machinist made a gland from a piece of hard wood, but could not make it hold the packing. In the neighborhood there was, belonging to the company that owned the engine, a furnace for smelting silver from the ore. The machinist made a pattern, and had a gland of silver cast, and used it on hie engine for several months, till the missing gland wae replaced by a new one from New York.

To IMPART A MOTTLED APPEARANCE TO SHEET-IRON.—W. D. Wood, of Pittsburgh, Pa., has patented a new process of imparting a mottled appearance to the surface of planished sheet-iron. Two-thirds of a pile of sheets are reduced between chilled rolls, and one-third are reduced by soft rolls. The latter soon become roughened by wear, and impart a mottled appearanee to the ebeets. In packing the sheets in charcoal one eoft-rolled sheet is placed between two hard-rolled sheets, and the pack is then baked. The planished surface is then produced by heating and hammering. The mottled appearance of the soft-rolled sheets will in the final hammering be transferred in part to the hard-rolled sheets, while the mottling on the soft-rolled sheets will be diminished. A uniform mottled effect is thus said to be obtained which is not excessive in degree, and which approximatcs closely the appearance of imported Russian sheet-iron.

IMPROVED METHOD OF RIVETING BOILERS, ETC.—A patent has been granted in England for a method of riveting boilers, tanks and similar articles of light metal. Instead of riveting in the ordinary way, a strip of asbeetoe cloth or other non-combustible material is introduced between the eheets to be riveted at the seam, thus insuriug, it is eaid, a perfectly tight joint. Tbe method is further applicable in the use of rivets for corners which are slightly countersunk at the neck, a washer of asbestos being placed in the groove. The inventors also etate that the articlee in wbicb the asbeetos strip is used may be afterward galvanized or similarly treated so ae to be rendered non-corrosive. Tbis system of using asbestos in the joints of riveted articles has long been employed in this country, but we are unaware that galvanizing hae ever been used in connection with it to render tbe joints non-corrosive.

IMPROVED CHAIN LINKS.—A chain link made from a bar of steel covered with iron bas been patented by W. Gerhard, of Philadelphia, Pa. Tbe eteel is not made in a single bar, but in a series of parallel layers or independent plates separated from each other by iron. The whole is thoroughly consolidated and welded together by rolling. The number of steel plates employed depends upon the size of the link to be produced. In a link made from a 1½-inch bar, five layers of steel should be used. The steel should not constitute less than one-quarter nor more than one-half the metal of the entire link. Tbe inventor states that by his improvement the welding of the bar into links is facilitated, and that tbe strength of the link is mucb increased.

ELECTRIC ALARM FOR HOT JOURNALS.—A number of years ago Prof. Charles B. Richards, tbe inventor of tbe indicator bearing his name, wbile superintendent of Colt's (revolver) Armory, at Hartford, Conn., devised an electric alarm for hot bearings, which was applied to the journals on the shafting. By tbe use of a compound bar of brass and steel an electric circuit connecting to an annunciator in the engine-room was closed and rung an alarm bell and also displayed a numbered tag indicating the line of shafting where the heating occurred. Some of the details may not be precisely related, but the general fact of using the expansion of metals to give warning of heated bearings before cutting occurs is as stated.

AMERICAN STOVES.—The United States uses more etoves than all the rest of tbe world combined. There are 8,000,000 of them in use bere, costing the possessors perhaps $180,000,000. They range in size from little toy affairs whicb could be carried upstairs one under each arm by an ordinary man, up to colossal stoves intended for tbc summer hotels and wood burning districts which will do tho cooking for 100 persons. Their price is calculated by their weight. The founders sell them at ratee ranging from five to eight cents a pound, and the retailers at about fifty per cent advanee on tbese figures. One stove lasts on an average about five years. Some large founders ehow nearly 500 kinds. Many also make etationary and Baltimore heaters, wrought-iron and stationary ranges and and gas vapor stoves, but these are not considered part of the trade. The chief producing places are Boston, Troy, Albany, Cincinnati, Buffalo, St. Louis, Louisville, Philadelphia, Cleveland and Leavenworth. Stoves are exported to each and all of the foreign countriee with which we have a trade of any kind. When foreign manufacturers undertake to make a etove, they invariably steal an American pattern in preference to devising a new one.

EXPERIMENTS WITH IRON.—At the Stevens Institute of Technology it appears that Professor Thurston has for many years been experimenting in the Department of Engineering on the structural changes and crystallization of iron, and has made important discoveries with the aid of what is now known as an autograbic, recording, testing machine. When a piece of metal is broken, a pencil diagram ie perfected which exhibits clearly and accurately the strength, elasticity, ductility, elastic limit, and shock resisting quality of the metal tested. It was quickly discovered that the elastic limit of any metal—that is, the strain at whicb it begins to yield under gradually increasing loads—becomes greater after loads less than the breaking load have been temporarily applied and the piece tbue perceptibly strained. By repeated applications of increasing loads it was found that the elastic limit could be brought up nearly, if not quite, to the limit at which rupture occurs. Some industrial processes, like cold rolling, produce a like effect.

SEPARATING TIN FROM SCRAPS.—An apparatus for separating tin from tin scraps has been patented by J. H. Kolb, of Brooklyn, N. Y. It consists of a tank inclosing an open basket, which is supported a short distance above tbe bottom of the tank. The basket is surrounded by a coil of steam pipe. A dissolving solution, such as a mixture of nitrate of soda and caustic soda, is poured into the tank and the tin scraps are placed into the basket. Steam is then turned on, and as it circulates through the coil it causes the dissolving solution to boil and to act uniform'y on the tin scraps. The tin combines with the solution and forms stannate of soda. After the tin is thoroughly dissolved the eteam is turned off and the basket is lifted out of the tank and emptied of its contents. When removed, the basket and coil are tboroughly rinsed to clean them of any deposits. The solution is poured from the tank and evaporated to recover the stannate of soda.

REPAIRING A WET LEATHER BELT.—When a leather belt has been slightly injured by rain or by being wet in any other manner, it should be dried as much as possible, and laps that may have started be fastened by a little cement, the composition of which is as followe is furnished by Page Belting Company: Equal parts of good glue and Prussian gelatine dissolved in water and cooked in a tin vessel set into a larger one containing water. Do not allow the vessel containing the cement to set quite on the bottom. It should be cooked until it is quite thick and ropy. It can then be worked into the places when the laps are started, by means of a knife. The belt should be bammered until dry, and a few pegs may be used, whicb you can get from a sboemaker; cut the pegs off a little from the surface of the belt on the reverse side, and hammer tbem down on a flat-iron or anvil or lap-stone.—*American Manufacturer.*

REGARDING HAND SAWS.—Stiff blades are made of better material than thick ones, and are less liable to "buckle" or "twist," and are not so apt to break. They require less set, will etand an edge longer, and are not so tiresome to work. They should be hung in plain beech handles with rivets flush or countersunk. The blade should be of dark color and have a clear, bell-like ring when struck with the ball of the finger. Blades of a light, iron-gray color are not so good. Never take a saw that jars or trembles in the handle. The first point is to grasp it by the handle and see that it hangs right and tbat the handle fits tbe hand properly. Then try tbe blade by springing it and see that it bends regular and even from point to butt. See that it has a good crowniug breast. Hold it at a distance and get a proper light to strike on tbe blade and you will see if there is any imperfection in grinding and hammering.

A NEW MOTOR.—The Hock motor, a new Vienna invention, consists of an air-tigbt furnace, whose fire is fed by compressed air; water is injected into the resulting gases of combustion, and tbe mixture of eteam and combustion products—called "air steam"—is lead directly into the engine. Tbere is thus presented the fact of machinery without a boiler, and the results of trials made with this arrangement are pronounced in the higbest degree satisfactory. Tbe macbine of 6 normal horse-power developed 12.23 effective horse-power, with a consumption of coal of 2.2 pounds per hour for eacb effeetive horse-power.—*Iron Trade Review.*

SCIENTIFIC PROGRESS.

The Sense of Taste.

The tongue is not the only organ used in the enjoyment of this seuse, and, alone, it is scarcely capable of appreciating delicate flavors. The differenee between salt and sugar, when placed on the tongue is hardly perceptible, provided the tongue is not allowed to touch the roof of the mouth and the lips. Indeed the act of getting the full enjoyment of a flavor, commonly called smacking the lips, consists in bringing the tongue into contact with the roof of the mouth and the lips. By this act the substanee to be tasted is spread over the surfaces of these parts, particularly of the tongue, and mixed with the saliva.

Just how this act produces taste ie not exactly known; but we do know that the tongue is covered with two layers of skin, the lower one thick and filled with nerves, and the upper one thin and porous. The nerves in the lower skin are the nerves of taste, and probably are set into vibration by the substance tasted, very much as the exquisitely sensitive nerves of the retinæ are affeeted by light, or the nerves of the ear by sound. At all events the sense is conveyed to the brain, where we involuntarily distinguish between pleasant and disagreeable tastes.

The nervcs, moreover, of the tongue, are not all alike. In the tip of the tongue they are clustered together more closely than at the back, and transfer to the brain a diffsrent sensation. For instanee, a little powdered alum placed on the back of the tongue tastes sweet, whereas on the tip it tastes acid.

The sense of taste is an almost certain guide to the wholesomeness of foods, and a monitor which warns us when we are in danger of swallowing any injurious or poisonous substance.

Poisons, as a rule, are extremely disagreeable to the taste, and it requires an effort to overcome the natural repugnance to them. Hence it is that accidental poisoning so rarely occurs.

In the case of foods, we soon tire of a thing as a regular diet, and the taste craves a change. Here the whole system rebels against the monotony of diet, because no one food is likely to contain all the elements of nutrition required by the body for the exercise of its functions, and soon the elements which are in excess cloy upon the taste, because the system is already supplied with them, while we crave the foods containing substances which the system lacks. A change is then demanded by nature and made manifest by the sense of taste.

If the change cannot be made nature sbows her disapproval by causing a loss of appetite or a repugnance to the condemned article of diet.

Again, in the case of foode which are much concentrated or have a strong flavor, like preserved fruits or syrups, the taste eoon becomes dulled to the pleasure of their eweetness, because tbe delicate nerves which convey the impression of sweetnees to the brain become fatigued and fail to respond to the exciting cause.

There seems to be also a set of tastes which are in some degree complementary to each other. That is, if we taste of some intensely sweet substance we cannot detect a less degree of sweetness until the nerves have recovered from their first impression; but we can appreciate keenly any acid flavor.

To illustrate this take a glass of lemonade, which contains substances desigued to produce botb sweet and acid tastes. If before drinking it we eat a lump of sugar the lemonade will taste sour; but if we take a little clear lemon juice first the lemonade will taste like sweetened water.—*Exchange.*

THE ORNITHORHYNCHUS is tbe unpronounceable name given to a queer little animal recently found in Australia, and wbich, it is claimed, forms a perfect connecting link between birds and mammals. It looks like tbe beaver, but instead of having hair on its back it has scalee, and in place of scales on its tail it has bair. This in itself would not constitute a missing link, but after long investigation we find, says Dr. Ward, that it lays an egg like a bird, but suckles its young like a mammal. Its habits are like the beaver's, but it is an utterly heterodox creature, and entirely the most unnatural known. The animal was figured in the *Scientific American* of March 15, 1884. Dr. H. A. Ward, an attache of the American Museum of Natural History, of New York, bas recently returned with several live specimens of this animal for the zoological department of the museum.

ORIGIN OF COAL.—One of our contemporaries, the *American Architect*, some time ago called attention to tbe general admission by geologists that all coal beds once formed the bottoms of lakes of fresh or ealt water, and it is thought tbat this fact indicatee an explanation of the production of coal which will remove tbe difficulties of the old theory. It is hardly conceivable tbat wood, especially through tbe loss of its hydrogen, should ever become converted into a substance plastic enough to flow like a river, taking the impression of objects along its banks; but it ie not difficult or unreasonable to suppoee instead of this, that the stagnant lakes of the coal districts were, ages ago, when the temperature of tbe earth was higher and vegetation more luxuriant than now, filled with little plants whicb even now sometimes discolor our drinking water, and that these, dying and settling to the bottom, may in time have so accumulated as to form a layer of carbonaceous mud of considerable depth. Something of the kind still goes on in such ponds, the bottoms of whicb are usually covered with a light, black mud, while tbe bubbles of carbureted or phosphureted hydrogen which rise when this mud is stirred show that it is in process of conversion into something at least very similar to coal. Such mud, if it could be supposed to accumulate undisturbed, would present, perhaps, all the qualities necessary to fit it for conversion by decomposition into coal. The presence of certain salts and mineral substancee which are often found in coal-ashes, but never in wood, might be due, on this theory, to impurities dissolved or suspended in the water of the carboniferous lake, and even the formation of petroleum, naphtha and bitumen, in connection with coal, is at least as easily explained by this hypothesis as by the old one.

Separation of Oxygen by Means of Silver.

Troost has recently demonstrated that metallic silver allows oxygen gas to pass through it at a red heat, in a manner similar to the passage of hydrogen through red hot platinum or iron, which was proved some years ago by Deville and Troost. For tbe experiments a tube of silver was used witb a diameter of 1 cm., the thickness of the metal being 1 mm. This was inclosed in a rather larger tube of platinum. When the tubes were heated, and oxygen gas was drawn through the space between the tubes, it was found to pass into the silver tube. The amount passed corresponded to 1·7 liters per hour for every square meter of silver surface. If air were passed between the tubes instead of oxygen, then it was found that practically only oxygen found its way through into the silver tube, as only traces of nitrogen accompanied it. The rate of passage was, however, very much diminished. These experiments were carried on by exhausting the silver tube by means of a Sprengel pump, but it was also found that it was not necessary to thus exhaust, as the simple passage of some other gas through the tube, such as carbon dioxide, was sufficient to cause the transfusion to take place, though at a considerably less rate than exhausting. When a silver tube of less thickness than 1 mm. was used, the rate of transfusion was increased. Various other gases were passed between the tubes, but tbey only passed through tbe silver at a very slow rate. It is suggested that this quality of silver, of allowing oxygen to pass with comparative ease, may be some day made use of for isolating the oxygen of the atmosphere, for which purpose a very large surface would be required. Large coils of tubes with thin metal could be used, with either an exhauster or a current of carbon dioxide. If the latter, the carbon dioxide could be absorbed in alkali, leaving free the oxygen.

WEIGHT AND COMPOSITION OF THE ATMOSPHERE.—One hundred cubic feet of nitrogen weighs, at a temperature of 32° Fahr. and a pressure of 15 pounds per square inch, 80 pounds; oxygen weighs 90 pounds; the mixture of 770 pounds of nitrogen and 230 pounds of oxygen makes 1,000 pounds of common dry air. As the oxygen is heavier, it occupies less bulk in proportion, so that if we take the air by bulk, 790 cubic feet of nitrogen and 216 of oxygen makes 1,000 cubic feet of air, which will weigh 82 pounds. The amount of watery vapor is very variable, changes from hour to hour, and differs in many localities; but the small amount of carbonic acid is less variable, and changes only from 1-2,500th part to about double that amount. Notwitbstanding it is witb water the important element required for tbe nourishment of vegetation, whicb could not thrive in an atmosphere only made up of oxygen diluted witb nitrogen.

A NEW PROCESS FOR CHLORINE.—A new process of making chlorine bas been described by *Le Genie Civil* as the invention MM. Pechiney. It consists in the addition of magnesia to a concentrated solution of magnesium chloride, so as to produce a solid mixture, whicb is then treated with air and heat. Nearly the whole of the chlorine is liberated, a part ae free chlorine and a part as hydrochloric acid. The residue consists of magnesia, which is used over again with a fresh charge of magnesium chloride.

THE ANCIENT QUARRIES OF THE PHARAOHS.—News has lately been received at Vienna concerning the last journey of discovery of Dr. Schweinfurth. He explored the eastern desert track between the Nile and the Red sea, where granite quarries have existed since the time of Trajan and Hadrain, and he made a new plan of this locality, which will assist us to a knowledge of the way in which the Pharaohs built and kept in repair their great prison in the midst of the Desert.

ARTISTIC PHOTOGRAPHY.—One of the finest and most picturesque scenes yet produced by the camera, saye a New York contemporary, is a flock of sbeep grazing on the campus in Central Park. There ie a pleasing variety in the attitudee of the animals, and although tbe number is large, each is a perfect portrait. The picture forms a study for the artist. The negative wae made by a member of tbe New York Society of Amateur Photographers.

TABLE OF CONTENTS.

EDITORIALS.—The Factory System; The Atlas Automatic Engine; Steam Engine and Boiler Practice, 345. Passing Events; A Mining Law Reminiscence; California Manufactures; The Silver Question, 348. The Wolf Safety Lamp; Foundry Notes, 349.
ILLUSTRATIONS.—The Atlas Automatic Cut off Slide Valve Engine, 345. Wolf-Muescler Safety Lamp, 349.
CORRESPONDENCE.—The True History of the Arnold-Slack Diamond Plant, 346.
MECHANICAL PROGRESS.—A Silver Piston Gland; To Impart a Mottled Appearance to Sheet Iron; Improved Method of Riveting Boilers, etc.; Improved Chain Links; Electric Alarm for Hot Journals; American Stoves; Experiments with Iron; Separating Tin from Scraps; Repairing a Wet Leather Belt; Regarding Hand Saws; A New Motor, 347.
SCIENTIFIC PROGRESS.—The Sense of Taste; The Ornithorhynchres; Origin of Coal; Separation of Oxygen by Means of Silver; Weight and Composition of the Atmosphere; A New Process for Chlorine; The Ancient Quarries of the Pharaohs; Artistic Photography, 347.
USEFUL INFORMATION.—Transferring Lithograph Pictures to Vehicles; Perfumes of the Orange; Paper Slippers; Driving a Nail; Water-Proofing Cloth or Leather; Oil from Pine Wood; Improvement in Cut Nails; Pickles and Their Packages; Hardening Tools; A Glass House; Hardening Plaster; To Cut India Rubber; Solder for Iron, Brass, etc., 351.
GOOD HEALTH.—The Organ of Form Defective; Mind Cure; Too Much Sugar; Figs as Food; Salt in Food; For Removing Moles; Electricity and Circulation; Lemon for Malaria, 351.
MISCELLANEOUS.—Working Ore at the Freeland Mine; English and Foreign Miners; The Slate Formation, 346. Arizona; The Meech Process; The Dawn of Truth; Georgia Gold Mines, 350. The Pioneers' Cache; Salt Town, 351.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 352-53.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 356.

Passing Events.

In several places in this State where surface mining is carried on the water has given out and the men have practically quit for the season.

There seems to be a very general demand in various parts of the mining regions for sampling works. Where these have been established they have greatly benefited the miners, who by their means are enabled to dispose of lots of ore, and continue work. A camp with a few hundred men working on their own claims is apt to be more prosperous than any "one mine camp."

The northern counties of the State continue to attract many miners, and considerable prospecting is now going on. The traveling representative of the PRESS, now in Northern California, will soon send for our readers a series of descriptive letters concerning the mining regions thereabouts, which will give a good general idea of the country as a mining field.

SUPERINTENDENT A. ARENTS, of the Mount Corey, has made prospects brighter for Coryville, Nev., by letting a contract for prospecting work in the mine. Good miners think there is an excellent chance to uncover another large body of ore.

FOR the last quarter the bullion yield of the Alice (Butte) mine was nearly $300,000.

A Mining Law Reminiscence.

At a reception given to Hon. John Sherman, of Ohio, by the Chamber of Commerce, Board of trade and Manufacturers' Association of this city, that gentleman in speaking of California said that "the mines of this State have added a great chapter to our laws."

It may not be generally known, but it is a fact that the first bill concerning mining laws, after California mining interests needed general lawe, was introduced in Congress by Mr. Sherman, of Ohio. He also introduced the third bill, Mr. Julian introducing the second. If either of these had been passed, the Pacific States and Territories would have received a blow from which they never could have recovered. The Government could only have receded after the most irreparable and widespread damage had been done.

At the commencement of the 39th Congress there was a strong disposition, not only in Congress, but throughout the East, to make the mines pay the national debt. The idea of relieving the nature of the payment of the immense taxes which the war had saddled on us by the sale of the mines on the far distant Pacific Slope, was the most popular ever started. Compelling other people to liquidate your obligations has always been a highly comfortable and popular proceeding.

The first bill on the subject was introduced by this same Mr. Sherman, of Ohio, and Mr. Julian, of Indiana, introduced another. Both of these bills contained the most odious features. The fact of Mr. Stewart being on the committee to which they were referred stopped them, though the Julian bill was more favored, the House passing a resolution substantially endorsing such legislation. The Secretary of the Treasury was then one of the strongest advocates of the sale of mines, and appeared to be under the impression that it would yield a large revenue. Mr. Conness suggested to him—when it was thought a partial success of his views would be more satisfactory than an entire defeat—that a bill should be prepared in his department. The Secretary then prepared a record bill, introduced by Mr. Sherman, which was a great gain on the first bill, but still very bad. Mr. Conness and Mr. Stewart, of the Committee of Mines, drafted a substitute, which, after several weeks of close study, resulted in what finally became the general mining act of July 26, 1866, granting titles in fee, which remained in force until the law of May 10, 1872, under which we now work.

This 1866 law, when drafted, was considered an advanced affirmative position, from which the granting, selling, or other calamitous disposition of the mines could be successfully withstood. But when it first came up it only had two warm advocates, Messrs. Stewart and Conness, of this State. Sherman had a great deal to say in the debate, for he still clung to the idea of the Government getting a profit out of the mines. In fact, he was one of those who thought that even after the sale of the mines the Government should be a sharer in the proceeds realized from them. The bill had a curious title—"an act granting the right of way to ditch and canal owners, through the public lands, and for other purposes." The reason for this title is given in Gregory Yale's work on "Mining Claims and Water Rights," the first original contribution on American Mining Laws, published in 1867.

It will be seen from these remarks that while Mr. Sherman is gracious enough to concede that our State "has added a great chapter to our laws," the State is by no means indebted to him for said chapter.

For a great many years there was a sad deficiency of attempts to elucidate the principles governing the law of mining property. In the old States where mining property was held like other real estate, and where the Federal Government owned no land, the subject of mineral laws attracted little attention. Until the act of 1866 there was no general law which authorized mining upon the public lands, though we have been mining here for many years. In fact our experience made the laws, our miners originally framing them in simple but forcible terms, in the various districts.

The policy of the government from the early organization has been to reserve from sale all lands containing minerals—that is, all known mines. For forty years after the land system was established there were no means by which the title of land could be acquired except by purchase or special donation, and the sale of mineral lands was prohibited. After the lapse of that period, a proposed system of sale in favor of actual settlers called pre-emption was adopted, by acts of partial application, and gradually extended until ths system became general. This is only another mode of making a sale.

The reservation of mineral land continued under this system. Aside from the coal, lead and copper mines on the public lands in the Northwest there was nothing to attract the attention of the masses to the mineral lands belonging to the Government, and consequently the land system expended itself in the disposition of agricultural lands. The policy of reserving the mineral lands was dictated by the vague idea of some immense treasures at some day to be realized in the shape of revenue, and under this nurtured idea, grown sacred by tradition and proved fallacious by all established facts, the policy was never invaded until the act of 1866 partially extinguished it. The preceding remarks concerning the history of the act show how near the old system came to being perpetuated by legal enactment. Even then it was thought to be a great concession to California.

Upon the acquisition of this State and the exciting results produced by the gold discovery the Government found itself fettered by the ancient policy of reservation, more illiberal than the laws of the mediæva ages relating to mining. The attractive qualities of the metal, its abundance, the facility of obtaining it, the freedom from prohibitions, either by the local or Federal Government, induced the population flocking here from all parts of the world to adopt a system of mining regulations, chiefly traditional, but entirely voluntary.

Strange to say, the system was not only established without the authority of the Federal Government, but all mining upon public lands was at the time actually forbidden. The local Government was delayed in its organization, and was, when orgauized, powerless to act freely on the subject. The Federal Government refused to act upon this strange and unexpected state of things, and the State Government, to some extent, assumed the control of the mines. In so doing, as much from the want of power as experience, the attempt at a system was necessarily crude. The policy agreed upon was to adopt the same condition of things which the Federal Government itself was compelled to acquiesce in. Under these circumstances the laws established by the miners themselves became the laws of the State. For once in history the laws to govern a laboring class were made by the class itself.

The courts of the State followed the same principle; they were left without direction by legislative authority, except by implication, in determining the principles upon which controversies about mining property should be settled, and naturally adopted the code presented by the miners. In some instances, as in the case of water rights, the courts departed from the rules of common law, which under the general law of the State was the rule of decision.

Under these rules of action the multitude of precedents grew up which not only furnish the law for the State, but are a guide in all controversies on the mineral regions in the United States now so widely populated. It was probably this Mr. Sherman meant when he said the miners of the State had added a great chapter to our laws.

It was not, however, until as late as July 26, 1866, that the following significant sentence was incorporated into the statute: "All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase by citizens of the United States, and those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or rules of miners in the several districts, so far as the same are applicable and not inconsistent with the laws of the United States."

THE mining outlook in Plumas is improving. It is true that there is not the rush of five years ago, but what is being done is upon a solid basis. There is no doubt that the county sustained a great deal of damage from the operations of stock speculators.

California Manufactures.

It is rather satisfactory to know that California is constantly increasing its importance as a manufacturing State. As new people come here who have no inclination for agriculture or mining they look about for openings in other directions, and as a consequence new industries are constantly being started. It is true many of these are so far on a small scale, but as we grow in population these industries grow also. At the time of the taking of the census in 1880 the State of California had 5,885 manufacturing establishments of different kinds, employing a capital of $61,243,784. These gave employment to 38,327 males over 16 years of age, 3,922 females over 15 years of age, and 1,460 children and youths. The total amount paid in wages each year is $21,065,905; value of materials, $72,607,709; value of products, $116,218,973. This is a pretty good showing for a State which, from a manufacturing point of view, is supposed to be of little consequence. Since these figures were compiled there has been an increase in manufactures, and from this on we can expect a still greater number.

At the time of the census of 1870 the State had 3,984 establishments, with a capital of $39,728,202. They gave employment to 24,040 hands, earning $13,136,722 wages annually. The value of materials was $35,351,193, and the value of products $66,594,556. During the ten years we increased the value of our annual product nearly $50,000,000.

The city of San Francisco itself, the center of population, is also the center of the manufacturing industries of the Coast. There are in the city 2,971 mechanical and manufacturing industries, with a capital invested of $35,368,139. These employ 23,662 males over 16 years; 3,588 females, and 1,192 children and youths. The total amount they earn in wages each year is $14,928,534. The value of materials used is $47,970,072, and the annual product is worth $77,824,299. This shows that out of a total value of annual manufacturing product of the State of $116,218,973, San Francisco is to be credited with $77,824,299.

These are the latest reliable figures, yet they were compiled in 1880, since which time it is fair to conclude there has been some considerable increase. Some of our older manufacturing plants have been enlarged and a number of new ones added. Among other things we have a cotton-mill, an entirely new industry. On the Alameda side of the bay a number of new enterprises have been inaugurated, such as the Judson Iron Works, the glass works, nail works, cotton-mills, etc. An important addition on this side of the bay is that of the shipbuilding plant of the Union Iron Works, at the Potrero, where one metal steamship has already been built, and an equipment prepared for building iron and steel vessels. Fruit canneries have multiplied all over the fruit-growing regions, and small factories of various kinds are on the increase. All these things go to show that California is growing in many profitable branches of manufacturing industry.

The Silver Question.

At the reception given to the Hon. John Sherman by the business men of this city this week, that gentleman said: We want such an adjustment of silver and gold that they can be exchanged in the Treasury of the United States for money certificates, and should be able to pass, equal one to the other, over the entire civilized world.

The speaker said that the people of the East were not opposed to the production of silver, but they believed that the two metals should be equalized. He believed that if the present system were continued it would have the effect of demonetizing gold. If silver were purchased for the miners at market value, coined at market rates, and paid out at market rates, silver coins would be received everywhere. Commissioners had been sent to Europe to ask for the establishment of a universal ratio. The European nations had refused to agree, but we can compel them to adopt that ratio.

He prophesied that if his method of coinage were adopted there would be as great an effect produced as by the resumption of specie payment.

WORK is progressing in Granite District, six miles south from Bernice, Nev., and the mines are showing good ore.

The Wolf Safety-Lamp.

The development of coal mines has kept pace with the facilities at command for ventilatiog and lighting. In fact it was formerly customary to leave unworked those mines, or portions of mines, in which naked lights could not be used without danger. Attention was then turned to the ventilation; but even with improved ventilation, the naked light was often not safe. The new era in coal mining dates, we may say, as far back as 1815, when Sir H. Davy and Mr. George Stephenson discovered the principle of the safety-lamp. Since then many improvements have been added to their lamps, but until recently none can be said to have given entire satisfaction; and even now the question of more light is being agitated.

The difficulties to be overcome by improvers were many. Attention was first directed to the locks, with the view of making them more secure, and of preventing the miners from picking them to light their pipes, or from relighting the lamps in the mines in case they had been extinguished—such a proceeding being, of course, highly perilous in fiery mines. The improvement of locks was not found, however, to be perfectly effectual, since the miner could, by the aid of his picker raise the wick of the lamp to such a hight as to draw the flame through the gauze and thus light his pipe. Legislation then made the act of smoking in fiery mines a criminal offense; but even this did not put an entire stop to it, nor could it be guarded against, since the pickers were indispensable in order to raise and trim the wick. On the other hand, could all the miners have been convinced that in drawing the flame through the gauze, they put in jeopardy their own as well as the lives of others in the colliery, and thus persuaded to cease from the practice voluntarily, still the danger would not be entirely removed; for we have it from no less an authority than Mr. Darlington that sparks may fly off from the lamp when the picker is used, and that one spark would be sufficient to cause an explosion.

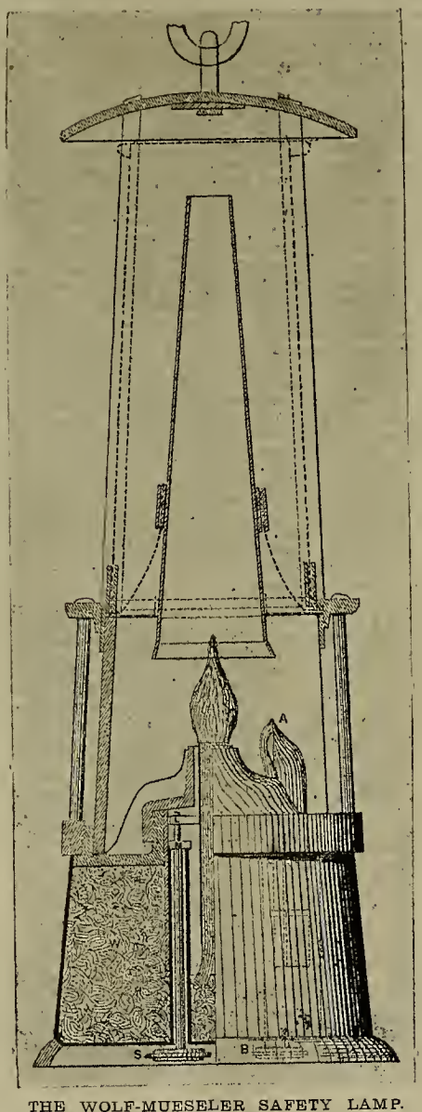
The next attempt was to invent a lamp which would not pass the flame through the gauze when moved rapidly. The Boty lamp on being immersed in an atmosphere highly charged with fire-damp becomes extinguished. But the miner thus finds himself in an unenviable position, since he cannot re-light his lamp, and must, consequently, remain in the dark or grope his way back to the fire-boss to have his light unlocked and re-lighted—a dangerous undertaking at best.

What was needed was a lamp, the lock of which could not be tampered with, the wick of which could not be raised, and which did not require a picker, and could be extinguished or lighted at pleasure without opening.

Such a lamp is the invention of Mr. Wolf, of Zwickau, Saxony, described before the American Institute of Mining Engineers by Eugene B. Wilson, of Drifton, Pa. A friend of Mr. Wilson's brought one of them from Germany last fall, and it has been greatly admired for its simplicity, efficiency and safety. The accompanying drawing shows Wolf's improvement as attached to the Mueseler lamp, which was considered by the Belgium Commission of 1868 to be the best, and the use of which was again made obligatory by a royal decree in Belgium in 1876, as it had been also in 1864, before the Commission re-examined the question. The Mueseler lamp is, like the Clanny, a modification of the Davy, in which a glass cylinder is interposed between the wire-gauze cylinder and the body of the lamp, so that the light of the flame is not diminished by the wire. The Mueseler lamp has, however, also a sheet-iron chimney inside the gauze, which is said to have the effect that the light is extinguished by a strong draft or by an oblique position. The Mueseler lamp burns vegetable oil. The Wolf lamp, on the other hand, burns benzine, which is less expensive, gives a brighter and more uniform light, and does not deposit soot. The consequence is that a much finer wire-gauze can be used, with great increase in safety; and the miner does not need to pick his flame or clean his lamp during the shift, the wick being made of mineral wool. The opening of the lamp is prevented by a lock which is operated by a magnet; and as it is not necessary to open the lamp to re-light it, all legitimate occasion for doing so in the mine is removed.

The body of the lamp, *W*, which contains the benzine, is packed with mineral wool to prevent spilling. Thus held the benzine is itself no source of danger. The flame may be made larger or smaller, to a limited and not dangerous extent, by the screw, *S*, working in the collar, *M*. The arrangement for lighting is not clearly shown in the drawing. It is similar to that which is so commonly sold by tobacconists for lighting cigars, consisting of a tape carrying at intervals small percussion-wafers. The dotted lines between *A* and *B* indicate in a general way the position in the lamp of this arrangement. The button, *B*, operates both the feed of the tape upward (bringing a fresh percussion cap to the point of ignition, *A*,) and by means of a spring, not shown, the trippiug of the lever which explodes the cap. This lever is shown in the drawing in contact with the tape-holder at *A*, as it would be just after the explosion of the cap.

In Serlo's *Leitfaden zur Bergbaukunde*, the



THE WOLF-MUESELER SAFETY LAMP.

above-mentioned advantages of the Wolf lamp are enumerated (but no drawing is given); and it is added that the lamp is said to go out when dangerous proportions of fire-damp are present, and also to burn in "bad air," long after oil-lamps have gone out. It certainly seems to the writer to be the nearest approach to a perfect safety-lamp which we have at present. There is, of course, yet room for invention. We want more light, and better instrumental means of warning when fire-damp is present.

THE PACIFIC COAST PRESS ASSOCIATION will have its mid-summer excursion this year from June 16th to June 20th. The members will visit Napa Soda Springs and vicinity. During the trip, excursions and picnics will be made into the mountains in the vicinity, also Oak Knoll farm, Krug's vineyard and St. Helena, aggregating in all some 45 miles of drives. Three days will be spent at and in the vicinity of the Napa Soda Springs. A number of musicians will attend this year, and a concert will be given.

STATE Mineralogist Hanks expects to start from New Orleans with the State collection of minerals by the last of the present month.

Foundry Notes.

The Pacific Iron Works have been reasonably busy of late, though not by any means running their full force.

Among the jobs recently turned out may be mentioned a 20-stamp silver mill and heavy hoisting plant for a mine in Central America; a 15-stamp silver mill for Chihuahua, Mexico; a 20-stamp gold mill for the Amador Queen mine, Amador county; a 10 stamp gold mill for the Utica Mine at Angels, Cal.; three large Bruckner chloridizing furnaces for Mexico; one 50 horse power Wheelock Automatic cut-off engine for the State Printing Department at Sacramento.

This firm still have the call on smelting furnaces, not only for the home demand but for many distant localities. They have recently supplied the new Selby Smeltiog Works with a 40-ton furnace and equipments, together with refining kettles, hydraulic elevators, etc., and have shipped four smelting plants to various mines in Australia.

The Duncan concentrator made by this firm seems to be attracting much attention and commanding large sale. Among the Mills recently equipped with them are the Amador Queen, Amador county; the Utica mill, Calaveras county; the Maxim mill, Inyo county; San Augustiu mill, Sonora, Mexico.

THE ELECTROLYTIC COMPANY, formed in this city last week to work the various patents issued to Dr. J. H. Rae, will probably engage in more varied work than was at first anticipated. The company, besides manufacturing the electrified quicksilver for amalgamation purposes, will also as soon as practicable, proceed to erect works to manufacture copper from copper matte, black copper, etc., by an electrical process. The laboratory of the company is at 35 Market St., where Dr. Rae is manufacturing and exhibiting the electrified quicksilver and other products. By recent improvements the prepared mercury can now be sold for $1 per pound, whereas by the old process, it cost $3. It is put up in 6-pound boxes.

Miners' Lore.

[Written for the Press by F. W. S.]

Cheap labor in mines is not economy. Those who have tried it don't need this advice.

The miner who misrepresents his property for the purpose of making a sale is a bad man for a camp.

The last thing needed in a new district is a mill or smelter, yet these are invariably wanted first by prospectors.

Theory looks well in print and sounds seductive to the ear; but it does not pay as well as practical demonstration.

Lease your mine to responsible parties if you are not able to work it yourself. A mine will bring you in more working than lying idle.

Be careful what mining machinery you buy. Find out to a certainty what treatment your ores need before contracting for machinery.

The miner whose experience has been confined to one district knows about as much about mining as a new German emigrant does about the English language.

A thorough knowledge of the mining laws of a district is the resident miner's most important duty. A defective title to a mine often causes more trouble than a bad deed to a farm.

A business man buying goods buys the latest styles and most improved manufacture. Old styles are not touched, no matter how cheap. Mining men who contemplate buying mining machinery should do likewise.

Many good claims are abandoned by miners who do not keep sufficiently posted on mining matters to know that oftentimes a low-grade ore can be increased to a high-grade by concentration. A good concentrator on an ore that averages $8 to $20 per ton will run it up to hundreds.

The plan of sinking a 10-foot hole in the softest place that can be found on a claim and of doing assessment work in like places is a mistake. Develop your prospect as you go. If the showing is not good enough to open it up properly it ain't worth locating.

Miners and mining men should hold meetings occasionally in their districts and discuss the mining laws that govern them. Bad laws could be revised and recommended for legislation. The practice of such meetings would result in much good to both miners and mining.

Do not be so vile as to take a man's mine that is worth $100,000 from him for one or two thousand, just because he gives himself away as having such a mine and is hard up for money. It would be unchristian-like on your part, and you can rest assured that he is a high-grade liar who offers a property of that value for so little money.

Studying books on mineralogy and stuffing yourself with jaw-breaking, technical mining terms, without some practical knowledge of mining, is of but little value. Miners with experience can learn a great deal by reading books on the treatment of ores and the characteristics of mineral-bearing formations. A miner without a good book on mining is worse off than a farmer who don't take a newspaper.

Coast miners would find it profitable to have an occasional correspondence with smelting companies of standing and experience such as the Selby Smelting and Lead Company as to the treatment required by their ores, what such ores are worth, and inform themselves in such matters. Often times the output of their mines would be of value to a smelter and pay a handsome profit to ship. The more a miner knows about ores and their values the shorter will be his days of hard work and poverty.

In most California mining camps the assayer finds but little to do. The consequence is that many a good paying claim is passed over by the miner, in search of that in which he can see mineral. If miners in the gold districts of California were to keep as frequent a record of the value of all kinds of ores taken out of their mines as the miners of a silver district do, they would know more about the different formations and in many cases new bonanzas would be discovered that are now passed over as N. G. Test your rock. You might as well try to read in the dark as to mine without using the assayer.

In no industry are so many sign boards, as it were, to guide the inexperienced from mistakes as in mining. There have been more monumental failures in mining and milling than in any other industry. The blunders of the past are legion, and in nearly every old mining district the mistakes in working mines or the erection of useless machinery stand as an eloquent "be careful" to the miner of to-day. There is less danger of being stranded in mining now than in any other calling, if it is entered into with the same caution and business-like methods and economy as practiced in merchandising or other legitimate business. Science and business will beat luck and chances every time.

Arizona.

Graham County Copper District.

[From our Traveling Representative.]

The largest copper district in the Territory is in Graham county. The magnitude of the workings of the copper mines in this district is known hut little outside of the immediate vicinity. The copper helt runs almost parallel with that of a gold-bearing formation; the latter lying along the west hank of the San Francisco, while the former lies some few miles distant from the river and higher up on the mountains.

The Great Copper Camp.

Clifton is the headquarters of the great copper interests of Graham county. It is the northern terminus of the A. & N. M. railroad. Situated on both hanks of the San Francisco, the place is one of interest to hoth miner and tourist. The town is picturesque as to location and surroundings. The offices of the railroad, the smelter and great huildings of the Arizona Copper Company keep the place up and it is doing a good business. During the days when copper was "up" Clifton was a lively as well as a tough place; it is not overly Godlike in appearance as yet, there being among the lower class many running gears of ill-spent lives, some of which defy competition in pure cussedness and Apache Indians in gentleness. No churches grace the towu. What religion prevails in camp is brought in, and when the supply is exhausted another installment is ordered.

The Arizona Copper Company.

This company is a Scotch corporation with headquarters in Edinhurgh, Scotland. They have the immense sum of $5,500,000 invested in mines, smelters, railroads, iuclines and machiuery. Duriug the early history of these mines the miningof ores was very expensive and the handling of the same was slow and limited, having to haul the ore several miles in wagons. A declining market compelled the contrivance of labor-saving machinery that lessened the cost and increased the output. Each succeeding year the steady decline in the price of copper caused additions to and more perfection in the different departments until the present date shows one of the finest plants and hest equipped copper mines on the Coast. This company has four groups of claims, 66 in numher.

Copper Deposits.

The copper-bearing formations lie more horizontal than otherwise. The mineral occurring in hunchy deposits and in long, chamher-like beds in lime formations on a quartzite-porphyry contact. Near the surface the deposits cousist generally of carhonates, associated with oxide of manganese, the same running ou an average of 15 per cent copper. A depth made of iron carhonates associated with a red oxide of copper increases the grade to an average of about 25 per cent copper. The ores of this district are mostly all self-fluxing, some of them sufficiently so to flux more than themselves. While occasional deposi's of nearly pure native copper are found, uo large hodies of such are discovered. The average of the ores of the district can safely he put at 18 or 20 per cent. No great depth has heen reached in any of the mines, as most of the work is done on the contact which lies more or less horizontal. Deep copper mining in this district has not proved as favorable as closer to the surface. No trouhle is experienced from water, in fact, it is a costly necessity. Little or no timbering is required in the mines. The ground is easily worked.

The Two Companies.

Alongside of the Arizona Copper Company are located the mines of the Detroit Copper Company, a New York concern. The latter company's interests are not to be compared with the Scotch people's as to magnitude or liheral husiness-like method of working. The mines of hoth companies lie side hy side on the summit of a high range of mountains at an elevation of nearly 2,000 feet ahove running water—the San Francisco river, six miles distance. The Detroit Copper Company controls the water supply on the hills; hence the friendly relations of the two companies.

A Dizzy Railroad.

From Clifton a 20-inch gauge road clings to the side of or runs on trestles over the bed of Chase's creek, a distance of about 10 miles. The grade averages four per cent with numerous 42-degree curves. The cars are set on one pair of trucks, and are made entirely of iron, with a capacity of 6,000 ponnds each. The handling of these cars up and down the incline from the bed of the canyon to the summit of the mountain over track that climhs the side-hill at an angle of 43°, is a sight worth seeing. The Longfellow incline is 2,200 feet long and passes through a 600-foot tunnel en route. A great wire rope that passes around a mammoth wooden drum is the "locomotive." Two cars of 6,000 pounds each of ore are started from the top, their weight hauling one loaded and one empty car from the bottom. Only three rails are used on the incline, the cars meeting and passing half way. The Arizona Copper Company have 6,000 feet of incline connecting their different groups of mines with the railroad to their smelter. The coke and supplies of the Detroit Company are handled hy the Arizona Company over their inclines and railroads.

The Copper Company's Smelter.

The plant of this company as it stands to-day is not only a credit to the huilders, but to the stockholders as well. Few American companies wonld have plodded along for years in the face of a dropping market and made such expenditures in machinery and improvements as these Scotch folks have done. Until recently the plant consisted of three furnaces of the crucible water-jacket pattern. Two of these were built hy Messrs. Rankin, Brayton & Co., of the Pacific Iron Works, San Francisco, and one hy Fraser & Chalmer, of Chicago. Two additional furnaces have heen added, making the combined capacity 300 tons in 24 hours. Water-power is used to run the crushers, hlowers and attachments, two turhine wheels doing the work. The ores, coke and fluxes, after being dropped from cars into ore-hins ahove the smelter, are carried through the various processes by machinery to the doors of the furnaces. From the furnaces a small army of Mexicans are kept busy night and day drawing off slag and copper. The hullion produced hy this company is 98 per cent fine, which speaks well for the furnace manufacturers as well as the efficiency of the superintendent in charge of the smelter.

The "Dandy" Pump.

At Morenci the great tanks that supply the camp with water are noticeable for the eminent position they occupy on the very hrow of the mountain. These tanks are supplied by a four-inch pipe from the San Francisco river, a distance of six miles. A pump worked by a turhine water-wheel forces the water to the elevation of 1,500 feet, and a distance ot over 31,000 feet. The capacity of the pump is 100,000 gallons per day. Henry Worthington, of New York, is the maker of the pump, and it is a fine advertisement of his success in a gigantic undertaking.

Adjoining Copper Claims.

Comparatively speaking, hut little prospecting has heen done by miners outside of the copper companies. What has heen done has resulted in opening up properties that even excel the hest of the company mines in their palmiest days. Along the head-waters of Chase creek, some three miles northwest of the Metcalf gronp of the Arizona Copper Company, are a numher of new discoveries that astonish even the natives; and some of these old-timers are used to seeing some fine copper prospects. Prominent among the new and rich strikes is the Alaska, owned by Messrs. Guthrie, McDermot and Denneu. The opening up of a fine vein of copper glance from the croppings caused a hurried and thorough further development which resulted in the finest showing for a bonanza copper mine that one could wish to see. A shaft down some 50 feet is in solid copper glance that will run about 70 per cent copper and carries also a good showing of silver and some gold. Although hut a prospect as to development, the Alaska is a full-fledged mine as to showing of mineral. Six cuhic feet of this ore makes a ton. The owners are practical gentlemen, "horse sense" miners who know the district thoroughly and work their claim in a husiness-like manner. They are running a tunnel to tap the vein at a good depth. A pack-train of 22 hurros deliver three tons of their ore per day at the Metcalf station of the Copper Company's railroad.

District Crushings.

Water plenty.

Coke costs $30 per ton.

Wood is not used extensively.

The U. S. Hotel is the leading house of Clifton.

The railroad fare from Lordshurg to Clifton is $4.25.

J. H. Vaugh is working the Queen for the Copper Company on a lease.

About two-thirds of the men employed hy the copper companies are Mexicans.

The population of Clifton and the mines of the copper company is about 1,000 in all.

Brown & Cocal are working the El Paso, an excellent copper claim on Chase creek, on a lease.

The circulation of the MINING AND SCIENTIFIC PRESS in this district leads all other papers.

The Arizona Copper Company own the A. & N. M. railroad connecting Clifton with Lordshurg, on the S. P.

Wm. and G. M. Bonnell have a number of mines near the Alaska which they will develop further this season.

Morenci is the name of the town in which the Detroit Copper Company's mines and smelter are located. This company is running one crucihle water-jacket furnace.

Captain N. S. Davis, a California pioneer, is superintendent of mines for the Scotch Company, and he supervised the erection of the railways and inclines of the company.

Wages paid hy the companies are about as follows: Chinamen, $1.50; Mexican lahorers, $2, miners, $2.25; White miners, $2 70. The nationalities ahove are employed in about equal numhers.

Gold in a quartzoze formation has heen found in driving a tunnel in on the Morning Star mine, in Alaska canyon. Mr. Parker, the fortunate owner, is investigating the value and extent of his new find.

The Stevens group, near the Alaska, on Chase creek, has some 700 feet of development done. Some 500 tons that averaged 20 per cent copper have heen shipped from these mines. The group is said to he bonded to capitalists for $100,000.

The Arizona Copper Company have placed a staff of efficient and gentlemanly officers in charge of their property. The following is the roster: Lawrence Russell, general husiness manager; James Colquhonn, superintendent of smelter; Capt. N. S. Davis, superintendent of mines; W. H. Jones, superintendent of railroads; A. B. Ferrie, assistant superintendent of mines. Captains Ed. Murry, M. A. Kelly and Joseph Johndrew have charge of the men of the different groups of mines.

An Eastern company hought a group of 70 claims east of the Alaska, near the head of Chase's creek, some time ago, paying nearly $300,000 for the ground. An agent negotiated the sale and the purchase was made through one man. The entire group has not one hundred feet of development, and if there are a dozen good prospects in the whole group nobody knows which they are. Such "wild-cat" sales are enough to kill any camp in the eyes of Eastern capital. Such a sale could not have heen made to Pacific Coast capital.

F. W. S.

The Meech Process.

The Laramie *Boomerang* says that H. B. Meech, of Cleveland, Ohio, has invented and perfected what is known as the Meech process of treating low-grade ores, experiments hy which have already demonstrated the fact that he is ahle to extract 90 per cent of metal from rehellious ores, such as sulphurets, sulphides, hromides, oxides, tellurides, etc. He came west for the purpose of superintending the erection of two plants of four carloads each of the Meech mining machinery, one in Colorado and one for the Utah Mining Reduction Company, of Salt Lake mining district.

The chief point claimed is that the ores for amalgamation must he decomposed, disintegrated and separated from their chemical combinations before amalgamation can take place, and in order that this may be accomplished the most important factor used is the one which has produced and is producing such marked results in the natural world. Water with super-heated steam, and high temperature with attrition are employed to cleanse the ores to prepare them for the operation of amalgamation. Crushing and fuming the ores will not secure this and they must he cleansed or separated from the associated minerals which cover them and protect them from the action of mercury before it can he brought in contact with them and thus accomplish the object desired.

Mr. Meech looked about as far as he could during his brief stay and expressed himself well pleased with the prospects here. The question of the magnitude and extent of our mineral resources need never enter into any speculation in connection with the future development of the country from the fact that is now assured. All we need is a metbod of treatment which will enahle us to utilize without destructive or disastrous loss the material that is already in our possession. We are situated in the heart of a mining basin that is inexhaustihle, and hence the importance of such a discovery as that of Mr. Meech, successfully demonstrated is heyond measure. Property that has heen worthless will now hecome desirable and profitable, and a new avenue of prosperity is now opened up to thousands of miners who have awaited in poverty and privation for some means of securing the reward for which they have lahored.

Mr. Meech has gone on to Utah and on his return will prohahly stop and investigate still more closely the resources of this great mining center.

THE SALT INDUSTRY IN UTAH.—The salt industry is one that ought to attain some importance in Utah, considering the inexhaustihle supply throughout the Territory. A *Tribune* reporter learned yesterday that operations are heing conducted on a somewhat extensive scale hy Jeremy & Co., at their works twelve miles west of the city. These works consist simply of a large natural pond, covering nearly 900 acres, into which the water from the lake is allowed to flow once a year. It then evaporates and a deposit of salt from 1 to 3 inches in depth is left. This salt is pronounced by Prof. Price, of San Francisco, to he first class in quality, and to compare favorahly with that from Liverpool and elsewhere. From 5,000 to 6,000 tons of salt are shipped yearly from three works. The most of it is of a course quality, for smelting purposes, hut some very fine tahle salt is manufactured. It is estimated that there is now 16,000 tons piled up at the works ready for shipment, and the waters of the pond contain nearly 400,000 tons in solution. An effort was made to induce the Utah and Nevada railroad to huild a hranch to the works, hut when that failed a line of harges was estahlished hetween the works and Lakeside. Capt. Dahl's little steamer is used as a tow-hoat and handles two harges loaded with 30 tons each. A pier 150 feet long has heen huilt at the works, and at Lakeside a Utah Central switch runs out into the lake a distance of 400 feet, and the salt is transferred from the harges into the cars. About 40 men will be employed at the works during the coming summer, and there is no reason why any one should he "too fresh" in this community.

According to the Florence *Enterprise* (Arizona) the Mammoth Mining Company has given notice to all employes that they will hereafter pay only $1 per day to miners and lahorers. This looks like "mammoth cheek." It must he an Eastern company.

The Dawn of Truth.

Every close observer of passing events must he aware that sentiment in California is rapidly hecoming favorable to a revival of mining in all its phases. All along the edges of the Sierra monutains men are concluding, and very justly, that the unreasoning crusade against mining, which began in this State a few years ago, and continued until it has sunk hundreds of thousands in senseless litigation, and destroyed millions of property, was engineered hy a few leaders of pnhlic opinion for the sake of the gain there was in it, in the shape of coin in their pockets. Men now realize that the coin spent in feeing lawyers, hiring newspapers and paying spies, would have leveed the rivers, impounded the dehris, and fostered and perpetuated the great industry of which California has ever hoasted. The truth is rising like the sun in the east, and throwing a light upon the enthusiastic opposition to mining, which has disturhed this State during the past few years, and enahling men to see the utter transparency of that opposition. At least $100,000 of hard earned money has heen paid to lawyers for championing the canse of the anti-hydraulic miners. These anti-hydraulic miners have heen most ingloriously duped. They have followed an opposition to hydraulic mining, that was led hy men inspired with the hope of gain, no matter where it came from. The seleaders of the anti-hydraulic miners have grown wealthy, whi'e those who furnished the money to fight the miners have grown poor, and entailed destruction and pauperism upon the mining communities. Whom have been benefited? The legal gentlemen who furnished the hrains of the opposition to the miners. This truth is gradually forcing itself upon the sturdy, honest farmers of the Sacramento valley, and with a spirit of disgust at their own simplicity, they are heginning to realize that they have contrihuted to their own impoverishment hy destroying the markets for their products, and staying the general wealth and prosperity of the State by aiding and ahetting the unwise and suicidal crusade against the miners. Over $1,000,000 have heen spent in crippling the mining industry of this State. By this unwise warfare $20,000,000 have heen kept from circulation, the farmers have grown no richer, and the navigability of the rivers has not heen improved. It is time to look at this question from a manly, common-sense standpoint, and if we mistake not, the people are gradually assuming that position.—*Oroville Mercury.*

Georgia Gold Mines.

Mr. Henry G. Hanks, State Mineralogist of California, who is at New Orleans with the collection of California minerals, has heen visiting the Georgia gold fields. He promises to to give us the fullest details of the manner of working these mines, their extent, character, etc., on his return to California.

The Dahlonega (Ga.) *Signal* says: Henry G. Hanks, State Mineralogist of California, was at the Union and Fannin county mines and visited the principal mines and mills at this place. He expressed himself as highly pleased with this as a mining country and said that gold mining here is yet in its infancy and that the outlook for the future is good. Mr. Hanks is a practical miner himself and talks intelligently and plainly to us on this great question of mining for gold. Mr. Hanks's visit here will do us much good in dispelling the erroneous ideas that non-residents have of our gold fields in the South.

The New Orleans *Times-Democrat*, in speaking of the visit, says: Henry G. Hanks, F. G. S., F. R. M. S. and State Mineralogist of California, who has heen a very close observer of every display at the Exposition, noticed the mineral exhihit of Georgia and remarked the heauty of the gold ores in that section. To satisfy his curiosity in that direction he took a ruuning trip to the gold fields of Georgia, from whence he returned yesterday. He expresses himself as surprised at what he found there, and is loud in his praises of the mines he saw. He found quartz-mills at work with as many as sixty stamps. Mining as yet is on a small scale there, but it is probahle capital will soon seek this opportunity of investment. The ore is mined at ahout twenty-two and one-half cents per ton, for which $2 is realized. Mr. Hanks speaks well of the possihilities of the Georgia mines.

This is only a single instance of many showing the benefits resultant from the Expositiou, for Mr. Hanks's opinion is regarded everywhere as the very highest in mineralogy.

At a miners' meeting held recently in Manhattan District, Nye county, Nevada, the houndaries of the district were defined as follows: Commencing at the mouth of the canyon ahout five miles east of the Manhattan Pass summit, and about eight miles from the town of Belmont, in the county of Nye, State of Nevada, on the road running from Belmont to Peavine, and following the main wagon road to the mouth of the canyon on the Smoky valley side of the range, thence southerly and following the course of the range to a point opposite and two miles easterly from the San Antonio station, thence easterly to what is known as Ralston Point in Ralston valley, including Baxter's Springs, thence northerly to place of heginning.

The Pioneers' Cache.

The nld miners of the "palmy days" made banks of deposit in oyster-cans buried under the hearths of their cnbins, and in all manner nf out-of-the-way places. In tearing down an old cnbin in Nevada lately, a buckskin purse, stiff and grim with age, bnt full of shining gold, fell from a rafter and becamo the prizs of the purchaser of the promises. The old cabin was occupied by a miner years ago, and long since dead. Above Placerville there is a largs flat which in the early days was very rich in gold, and the old chimneys of ths miners' cabins still dot the flat riks the ruins of a Bashan village. Every hearthstone has been torn up and prospected for deposits, and around ths cabins are prospect holes, sunk by ths latter-day comers in scarch of hidden treasure. Not a few wers successful, [and many nn nld oyster-can has hecn found hidden away lilled with tho precions metal, left by ths early miners who wandered off, expecting to rsturn, or left by those who suddonly died with their boots on.

Above Green valley, on the American river, is a bar which, in early days, was immensely rich. Two miners worked the bar years ago, and suddenly disappeared. Several years after the bar fell into other hands, a shaft was sunk to bedroek nnd large quantities of gold taken out. One day a Mexicau cams upon the grounl and asked permission to prospect ons snd of the bar nsar a large rock. He was granted permission and after wnrking a few days disspeared. He went to Dutch Flat and sold several thousand dollars wortb of gold dnst, whieh, coming to ths knowledge of the owners of the ground, they examined the placo wherc he had wnrked, and discovered that he had found a cnche; probably the gold mined and hid by the early pioneers who had so suddenly disappeared. The mining sections of the State nrs rich with these deposits of the old minsrs who disappearcd leaving no trace behind, and whose bones lie bleaching on mountain top, in canyon and ravine, with no monument to mark their last resting place save the tall pines whicb sing requiems ovsr the graves of these lost ones. Could the early history of California be written in all its details, it would form a volume of romance, startling as it would be interesting, and again demonstrate the fact that trnth is stranger than fiction.—*Oakland Tribune.*

Salt Town.

A New City on the Desert.

The New Liverpool Manufacturing Company at Salt Town, in the Colorado Dssert, has erected a fine steam mill with all ths modern nppliances for reducing the salt from their mines and preparing it for market. Their mill, costing $20,000, is situated two miles from the Southsrn Pacific Railroad, between Walters station and Dos Palms. The mill is situated 3,100 feet from ths road on a spur. The water for the boilers is brougbt 5,000 fest on the top of tbe ground in an iron pipe; and the intense heat, 112 degress in the shade and 132 degrees in the sun, heating the water in the pipe to a temperature of 130, whicb makes it hot enough to inject into the boiler without the aid of artificial heat. The salt is taken from n laks where the salt has a crust over the surfacs of some two or three feet. Holes are cut through the crust ten feet in width and twenty or thirty feet in length, wben a fresb clean crust of nearly pure salt forms in crystals, which ars shoveled up and hauled to tbe mills where it is reduced to a fine crystal salt from 97½ to 99½ per cent. The company also furnish the ice companies, pork packers, creameries and retail trade as far east as El Paso, to the San Joaquin valley, Southern Nevada and the coast counties. The fineness of this salt being from 18 to 20 per cent greater than the imported Liverpool salt makes a market for itself to the exclusion of imported salts. The New Liverpool Manufacturing Company have been so harrassed and annoyed hy tramps that tbcy have imported two blood honnds who keep the tramps away from the works, but do not molest them ns they pass along the road across the desert. These valuable mines that now bid fair to be one of tbe important industries of Southern California are situated in the lowest point in the Colorado Desert, 264 feet below the level of the sea, wbere the average temperature is over 100 degrees in tbe shade, in a territory that at present is otherwise worthless and nnproductive. The development of new and important resources, mineral, agricultural, horticultural and viticultural, in Southern California come on us so rapidly that they almost stagger the credibility of our people, and as a natural consequence open the way to enterprising men to make large fortunes in their first development. —*Los Angeles Herald.*

Tbe Winnemucca *Silver State* reports a new and important strike on the Paradise mines, near Spring City. Bauman & Luther, who own a claim called the Glory, about a mile and a half below Spring City and on the east side of the canyon, have been prospecting it lately. At a depth of 20 feet they have struck a foot of solid ore. The strike is considered of great importance in Spring City, as it proves that rich ore exists in the district a mile and a half from the Paradise Valley, Bullion and Wild Goose mines.

Useful Information.

Transferring Lithograph Pictures to Vehicles.—In doing this work it should be remembered that common colored or uncolored lithngraphs are printed on soft, porous paper, which, when mads damp or wet, stretches, and upon drying shrinks to a great degrec. This peculiarity of the paper must be first attandod to. Lay ths picture face down on a table, dampen the back well with eleau water nnd lay ovsr it several newspapers to keep it from drying. Now, having a white or light colored ground ready, put upon it n thin cont of pale rubbing varnish nnd let it set until nearly dry, that is "tacky," as size would be in laying gold, then lay the dampened picture face down upon the varnish and rub it gently with the fingers until it is well stuck down to every part. Let all dry hard, then with a soft sponge and clean cold water, wet and rub off svery vestige of paper. The picture will be found upon the paint as if printed directly thereon, but of course reversed. A coat of rubbing varnish will prepare it for finishing, or the picture may bo colored if desired. Colored prints may be done in the same manner, but salt should be added to the water to prevent the colors from running. After all is done, a coat of varnish will make a finish.

An oil cloth should never hs scrubbed with a brush; but after being swept, should he cleaned by washing with a soft flannel and lukewarm or cold wntcr. On no account use soap or water that is hot, as either would have a bad effect on the paint. When the oil-cloth is dry rub it wsll with a small portion of n mixture of beeswax softensd with a minute quantity of turpentine, using for this purpose a soft furniture polishing brush. The following is also used to keep oil cloths looking well: Wash them once a month in skim-milk and water, equal quantities of each. Rub them once in thres months with boiled linseed oil. Put on a very little, rub it well in with a rag, and polish with a piece of old silk.

Perfumes of the Orange.—From the orange, *Citrus aurantium* and *C. bigaradia*, are obtained five distinct and valuable perfumes: 1. The true orange flower essence, obtained by digesting the flowers with lard. 2. *Oil neroli petale* or *oil neroli bigarade*, hy distilling the flowers of the sweet and bitter orange respectively. 3. *Oil neroli petit grain*, obtained by distilling the leaves and unripe fruit. 4. *Oil orange of Portugal*, obtained by rolling the fruit in a metal cnp covered with spikes on its inner surface (known as *ecuelle*), which wounds the rind, and causes the essence to flow from the oil glands. 5. Commercial *oil of orange*, obtained by expressing or distilling orange peel.

Paper Slippers.—Paper slippsrs are the latest form in wbich paper is introduced in new inventions. An Englishman has patentsd a system of manufacturing slippers, sandals, and other coverings for the feet ont of paper. Papcr pulp, or papier mache, is employed for the upper, which is moulded to the desired form and size, and a sole is provided made of paper or pasteboard, leather board, or other suitable paper material, which is united to the upper by means of cement, glue, or other adhesive material. The upper is creased, embossed, or perforated at tbe instep and sides, which renders them somewhat pliable, and prevents their cracking while in use.

Driving a Nail.—There is quite a scisnce evsn in so simple a matter as driving a nail. A correspondent in an exchange writes that he recently witnessed the experiment of driving nails into timber that had been hard seasoned and well dried. The first nails, after passing through an ordinary board, went into the timber about an inch, and then doubled up under the hammer. The tips of the rest of the nails were dipped into lard, and the driving was accomplished without any difficulty. The remedy is not a new one, but is simple enough to be recommended for trial.

Water-Proofing Cloth or Leather.—When paraffine is thoroughly mixed with linseed oil, cast into small blocks, and allowed to cool, it may be used to make any fabric as cloth, felt and leather water proof by rubbing it with such a block, and ironing afterward to equalize the distribution of the material in the pores. If too much is not put on, the material may he made to be only impervious to water, but not to air, as the very small greasy pores repei the water hut not tbe air.

Oil from Pine Wood.—A distillery has lately heen put in operation in Charleston, S. C., for manufacturing oil from pine wood. The material is subjected to intense heat in sealed retorts, and one cord of it is said to yield 15 gallons of turpentine, 80 gallons of pine wood oil, 50 husbels of charcoal, 150 gallons of wood vinegar, and a quantity of inflammable gas and vegetable asphaltum. The oil alone is worth about 25c. a gallon, and is used by painters and ship-hnilders.

Improvement in Cut Nails.—An improvement in the manufacture of cut nails has been patented hy Mr. Johu Young, of Wheeling, West Va. This inventiou provides a new form of die for shaping the nail ahout the bead, so its strength will be re-enforced, and thns prevent tbe heads from being so frequently broken off in driving, as has been the case beretofore.

Pickles and Their Packages.—The wood of the pickle kegs may be protected by coating it with parallins. Bottles, however, are the best vessels in which to preserve pickles. A beautiful green color entirsly destitnts of any poisonous qualities may be made by dissolving 5 grains saffron in ½ ounces distilled water, and in another vossol dissolving 4 grains indigo carmino in ½ ounces distilled water. After shaking up each thoroughly, thoy are allowed to stand for 24 hours, and on being mixed together at tho end of that time a fins green solution is obtained, capahls of coloring picklos, etc.

Hardening Tools.—It is said that the engravers and watchmakers of Germany harden their tools in sealing-wax. The tool is heated to whiteness and plunged into the wax, withdrawn after an instant and plungsd in again, the process heing repeated until the steel is too cold to enter the wax. The stocl is said to become, after this process, almost as hard as the diamoud, and when touched with a little oil of tnrpentins the tools are excellent for engraving nnd also for piercing ths hardest metals.

A Glass House.—A Boston man is putting up a building in Chicago, the walls of which will bs of plate glass, and there will he very littlc material in the whole structure except glass, cement and red slate. The building is to be used for offices, and it is reckoned that 75 per cent of the entirc space can be mads available, whereas in ordinary buildings the amount is only from 42 to 54 per cent, so much more being taken up hy walls, halls, etc.

The carriage manufacturing interest of this country, including wagon nud car factories, gives employment to 54,589 persons, and the three or four hundred thousand persons who are dependent on them, and who furnish the raw material. Tbs husiness has extended rapidly over tho United States within the last quartsr of a century. Fifty years ago it was mainly prosecuted in only four Northern States. The numbers of firms, from the bsst information at hand, in the United States is 15,000, and more carriages are manufactured in this couutry than in all Europe.

Hardening Plaster.—The author mixes intimately 6 parts of plaster of good quality with 1 part of fat lime, recently slaked and finely sifted, and uses this mixture like common plaster. He then moistens the object thus formed with a solution of zinc or iron sulphate. —*M. Julhe.*

To Cut India Rubber.—If a knife, or any sdge tool, is moistened with a strong solution of caustic soda or potash, it will cut India rubbsr quite easily.

Solder for Iron, Brass, Etc.—Chloride of zinc dissolved in alcohol will make a good flux for soldering iron, brass or other metal.

Good Health.

The Organ of Form Defective.

Much interest has hceu centered lately in what is called "color-blindness," and inquiry has determined that it is mueh more universal than has been supposed. This inquiry has very naturally led to a more critical inquiry into the condition of others of the human organisms, and now we learn that ths organ of "form" is not unfrequently found quite defective. A late number of the *Christian Union* quotes an artist's experience in relation to persons wbo are lacking in the perception of form as follows: "I have, during many yenrs of art teaching, and in various other ways, encountered a peculiar form of visual defect which is akin to color-blindness. Instead, however, of being insensible to a difference in color, these people appear to have lost, if, indeed, they have ever possessed, the power of perceiving clearly defined forms—form-blindness, in other words. I have sometimes placed objects in the shape of hexagons, or octagons, or decagons, or even so common a shape as a pentagon or a five-pointed star, before these pupils as a test, and almost invariably they were unable to distinguish one form from another, even when with careful distinction the differences were explaiued to them. Then, again, I have tested them by asking one to draw a figure with a certain numher of sides, and the result in this case would be the same. A request to draw a decagon would bring forth a figure whose shape has never been, and never could be named; and if asked to draw a square the result would he a rhomhoid, or some fearful atrocity of augles and lines. It was very amusing. This fact is a curious one, and I do not know whether it has ever been treated scientifically or not. There certainly seems to be a good field for scientific investigations in this strange defect, and I snspect that the trouble would be found to lie very near to that which causes color-blindness, if ever it is investigated."

Mind Cure.—Much attention is just now heing attracted to the subject of "Mind Cure." The *Phrenological Journal*, in reference to the matter, says to an inquiring correspondent: "We do not douht your relation of the effect of the treatment you have received, and it is prohable that if persisted in it will prove altogether curative. Functional diseases will yield to mental impressions far more readily than most people are disposed to believe. Lesions of tissue, like ulcers, cancer, necrosis, consumption, kidney granulation, etc., may test faith in mental cure to the utmost, but there are cases of such diseases that havo been greatly improved and even cured. Every well-informed physiologist knows the wonderful influence of mind upon body, and will not pooh-pooh so extraordinary a statement as that of the disappearance of a scirrhus cancer of long standing under presumably mental influences.

Too Much Sugar.

A mother often complains that her child is troubled greatly with sour stomach, but this cause is no longer mysterious when the mother, to quiet the little one so that she can continue her account of the case, sets down before her a little dish of sugar, from which the child may help itself. Most mothers would give candy or a cookie instead, though some feed their children with lumps of sugar from the bowl, believing that the children need sugar, and better have it in that form than in any other. In any cass of this kind there is a very frequent call for water. Do you know how vinegar is made? You can get plenty of it by mixing sugar or molasses with water and keeping it warm. A sour taste in ths month after eating sweets is of very common occnrrence.

It is the acid caused by the fermentation of the sugar left in the mouth with tne saliva that causes the decay of children's teeth—this and the lack of bone forming material in the daily food. Vinegar "eats" lime, as one can tell hy leaving an egg in vinegar. Bits of sugar or candy left to ferment among the teeth destroy their enamel, as well as do pickles. Ths child that is fed on sweets naturally craves pickles as an antidote, but well-fed children are contented with plain nourishing food if properly prepared and sufficiently varied.

Many imagine that all children should have free access to both sugar and pickles in order to supply what they suppose to be natural cravings, and to prevent thefts of sugar from the family bowl. A mistaken policy.—*American Agriculturist.*

Figs as Food.—The fig, especially in its prepared state, on acconnt of its excessive sweetness, is objectionable for some dyspeptics, especially persons suffering with acid dyspepsia. The first objection can be in a great part removed, however, by steaming. The great number of small seeds which it contains are also objectionable to a certain class of dyspeptics, especially those who have what is known as paiuful dyspepsia—a form of the disease in which there is a considerable degree of tenderness, as shown by pressing upon the pit of the stomach.

Persons suffering with inactivity of the bowels may eat figs daily in moderate quantity, with great benefit in most cases, making the fruit a part of each meal.

Salt in Food.—If we eat the grains, vegetables and fruits and other foods as nature supplies them, says a contemporary, we should have no occasion for salt on our tables, as that substance exists in natural food in the quantity and organized state adapted to our purposes. But the common processes of cooking destroy a good proportion of the saline elements, and hence the craving of the system that is sought to be met hy the inorganic product of chemistry. Ths quantity needed is very small compared with what people get into the habit of taking with their food. One leading objection to the immoderate use of salt is the fact that it impairs the taste for simple foods and delicate flavors.

For Removing Moles.—Dr. Benjamin Godfrey, in "Diseases of the Hair," gives the following: "Local maternal marks or moles can be easily removed by applying the acid nitrate of mercury and letting it remain upon the diseased patch till it dies. My plan is to take a fine pointed glass tube, and, having dipped it into the caustic solution, to dot all around the hirsute mass upon the healthy skin where they both join; then to dot points through the mass, like the white squares upon a chess-board, leaving the blank ones to be treated in a similar manner a fortnight hence. By such a method you prevent too great an inflammatory action setting in and making a less scar in the future.

Electricity and Circulation. — Persons with the mental temperament well indicated possess a higher electrical state than others; their circulation is more rapid, but we do not think that increase of electricity is dependent upon the rapidity of the circulatiou. The charge is derived from without, the peculiar activity and sensitivity of the nervous temperament being conducive to the frictional influences that are productive of electricity. If the charge were dependent upon the circulation of the blood current, then one in a high fever or in that anæmic condition that is usually associated with a quick pulse should exhibit a high electrical excitement.—*Phrenological Journal.*

Lemons for Malaria.—Dr. Crudelli, of Rome, gives the following directions for preparing a remedy for malaria which has proved efficacious when quinine has given no relief. Cut up a lemon, peel and pulp, in thin slices and boil it in a pint and a half of water until it is reduced to half a piut. Straiu through a linen cloth, squeezing the remains of the boiled lemon, and set it aside until cold. The entire liquid is taken fasting.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CON. AMADOR.—*Ledger*, May 23: At the Con. Amador, of Sutter creek, 12 men are employed in running a drift eastward at the depth of 1,500 feet. This drift has reached 200 feet from the shaft. So far the developments have not been of much importance, but the intentions is to run a considerable distance yet. Vast bodies of quartz have been encountered at various points in the prospecting operations which have been carried on for years past, but all have proved of too low a grade to pay for working. In the eastern portion of the mine, very little prospecting has so far been done, and hence the present drift to determine whether mineral in paying quantities exists in that direction. This company has proved the most indefatigable prospector in the county. The stockholders have been called upon to pay nine assessments of 50 cents each within a few years, without receiving anything in return. Still they stand up gallantly to the work with perseverance that certainly merits success. During this long period of unproductive labor the employes have been paid regularly every month. H. I. Bostwick has some mining ground just south of Jackson, on the line of Zeile ledge, and lying within the limits of what is called the Mother lode. He is unable to work it himself, owing to sickness and lack of means, and is willing to sell it outright, or would give an interest in it to parties who would do a certain amount of work upon it. This is an opportunity worthy of the attention of capitalists and mining men. There are heavy quartz croppings, and the ground proved exceedingly rich in placer gold in early days, and all indications point to the probability of a big mine in that locality. The Mahoney mine was shut down Saturday morning, after a spasm of less than a week's activity. The exact cause of this action we are not able to explain. There is no prospect of its being started again. The pumps have been disconnected, which practically means to let the mine take care of itself. A large and substantial frame building, 20x40 feet, has been built at the mouth of big tunnel at Middle Bar, probably intended for a boarding-house. An office for the company is also being built near Mr. Nevill's residence. The Huntington roller quartz-mill at Murphy's gulch has been started on the dump pile of the Morgan & Shugert claim, with a long run ahead in the event of the result proving satisfactory. The course of the big tunnel at Middle Bar has been inclined slightly to the west, toward the slate, evidently with the view of prospecting for ledge matter.

VOLCANO.—The Volcano Gold Gravel Mining Company is cleaning up at present. Several thousand dollars have already been sent below. Mr. Ross had about 75 tons of rock crushed at the Downs mill, which paid about $35 per ton. There are indications of the Tellurium mine, located at Pine Grove, starting up soon.

Mariposa.

GERTRUDE.—There is considerable activity in mining circles. The Enterprise people continue to abstract ore and the mill will start up next week, when it is expected to run for some time. The Lucky Bill mine has closed down for the present. The owners took out considerable ore the past winter which they had worked at the Enterprise mill, and which paid a handsome profit. The Fresno mine, owned by Messrs. Dolan & Graham, is being worked by them with magnificent results. The ledge is small, but very rich. From 4 tons of ore recently reduced at the Enterprise mill over $900 was realized. One of the most important discoveries ever made in this district was made about a month ago by John Hale and Charles Tucker, on the east slope of Crook's mountain near Metcalf's gap. This ledge is six feet wide and it all carries gold, with a large percentage of gold-bearing sulphurets, of which samples have been sent to San Francisco to be assayed. The ledge lies between granite and slate with a fine gouge on the foot-wall. The owners are engaged in sinking a shaft which is now down 35 feet, and they say the rock improves as they go down. Messrs. Baker and Crain are prospecting Miani mountain for a quartz ledge where they have found some very rich float that assays up in the hundreds. Messrs. Collins and Christianson have been doing considerable work the past winter and spring on French gulch, and have opened up several fine lodes. From the present outlook it is only a matter of time when that section will be a booming mining camp. At Grub gulch mining is quite active. The Gambetta mine and mill are running full-handed, also the McDonald mine and mill. The Lafayette mill has been running on King gulch rock for some time, with good prospects. That mine will probably commence operations shortly. Messrs. Betts and Oxindine are sinking a shaft on the old Ned mine, situated on King's gulch, where they hope to strike it rich soon. Their prospect is spoken of very highly.

Nevada.

STRUCK THE LEDGE.—Grass Valley *Union*, May 23: The downright shaft which has been in progress of sinking for some months on the Grass Valley Company's location (the Bobby Smith ground) which adjoins the Ford & Mullen claim, reached the depth of 188 feet on Wednesday night, at which point a ledge of good appearance was struck. None of the ledge had been taken up yesterday, and its size was not definitely shown. This ledge is in a good locality, and it may be reasonably expected that it will turn out paying ore when it is opened upon.

RICH ROCK.—San Juan *Times*, May 23: Immensely rich rock has been discovered recently in the 300-foot level of the Delhi quartz mine. The vein is of an average width of 11 feet, and none of the rock taken therefrom is discarded as worthless. It is all put through the mill. The Delhi mine is, in our opinion, the best quartz mine in the State. Specimens have been taken from that mine in which quartz is the exception.

LONE TREE MINE.—Foothill *Tidings*, May 23: The Lone Tree mine, near Allison ranch, has been purchased by some San Jose parties, John Sevenoaks being their agent. We could not learn the purchase price of the mine. Work of clearing out the tunnel and general repairing has already been commenced, and is under the supervision of John Townsend. When the Lone Tree was working much of the quartz showed gold, and gave encouragement for further developing the mine. It is the intention of Mr. Sevenoaks to push work ahead as rapidly as possible, and they will soon find out what is in the mine.

CALEDONIA QUARTZ MINE. — Nevada *Herald*, May 26: Work at the Caledonia quartz mine, Canada Hill district, is at present going on satisfactorily. The large volume of water encountered some time since, has been run off through the drain tunnel, and now the owners are engaged in sinking on the lead. About a ton and a half ore is being taken out per day by two men on a shift, and when a sufficient quantity has been taken out to obtain a fair test, a crushing will be had. In the shaft a big lead will, no doubt, soon be struck. The rock already taken out is heavily charged with sulphurets, and doubtless will give a good return. The owners feel somewhat pleased to think that they have got the heavy body of water, which has been a great drawback, out of the mine.

Placer.

IOWA HILL MINING NOTES.—Placer *Argus*, May 21: The mines are doing well and look first-rate for large yields of gold in the near future. The Golden River Co. are going to great expense in refitting their mine. They have upward of fifty men employed at all kinds of work. The company are putting up new buildings for hotel accommodations, cottages for families, etc. The mine is reported to be looking splendid, and the new company are pleased with their purchase and are desirous of securing more ground in the vicinity. The company are putting up a telephone line from the mine to Iowa Hill. The Watts Bros.' mine is reported to be yielding satisfactorily to the owners. They employ some five or six men. The Colden Gate mine continues its reputation as the boss nugget-producing mine of the district. We were shown a nugget by A. D. Bowley, taken from the mine last Saturday, that weighed over a pound; besides this big one, he exhibited several smaller ones taken from the mine the same day. The Morning Star mine employs some ten or twelve men. The mine is reported to be looking splendid, and the owners appear to be entirely satisfied with the present returns. Other mines in the district are reported to be doing well. When the tunnels are driven back into the main ridge, into the main tunnels, this is destined to be the richest mining camp in the State.

THE OLD THIRTY-ONE.—Placer *Herald*, May 23: The old Thirty-one quartz mine, located on the Auburn and Sheridan road, a short distance this side of Dane Town, and formerly worked by J. C. Crosby, has been taken hold of by a San Francisco company, who after three weeks constant pumping have got the water out, and are preparing to put up new hoisting and pumping machinery, and work the mine systematically. When Mr. Crosby operated the mine he worked under certain disadvantages which this company will overcome, and knowing from the past what is in the rock they are confident of making it pay.

Sierra.

THE YOUNG AMERICA MINE.—*Sierra Tribune*: From parties who have recently visited the Young America we learn that the mine is looking remarkably well. The road leading from the Sierra valley thoroughfare to the mill will be finished in a short time. Grading for the mill site has commenced, and the strong, heavy wood-work for the same is being framed at Haggerty's saw-mill. The owners fully expect to have everything in perfect order and the mill running by the Fourth of July. One of Hallade's wire-rope tramways is to be erected to convey the ore from the mouth of the tunnel to the mill. The length of this tramway will be 2,500 feet. The future outlook of the Young America mine is very flattering. Under the judicious management of A. C. Busch everything pertaining to the successful working of the mine will be carried on in a satisfactory manner.

MILL.—*Mt. Messenger*, May 23: Mr. Sutherland went below some two weeks ago for the purpose of procuring a Huntington quartz-mill for his quartz claim at Poker Flat. This location extends 1,500 ft. on each side of Canyon creek and the rock prospects well on both sides. The tunnel now being run at Deadwood, by Mr. Rouse, is for the purpose of working the New Orleans ground, which was too low for any of the tunnels heretofore driven through the property. We understand that the company give one-half the claim for the running of the tunnel 1,200 ft. The Slug canyon mill was started again Tuesday and will be run as long as water holds out. Since the stoppage the lower level tunnel has been driven ahead some distance to the ledge and no difficulty had in keeping the eight stamps going. J. E. Carney is in charge of the amalgamating department for a time.

Siskiyou.

ORO FINO.—Cor. Yreka *Union*, May 21: The miners of this camp have about wound up for the season, the water being almost exhausted, and the farmers coming in for their share. This has been the lightest water season known for many years, there only being water enough here for one claim to run at a time all the season. Messrs. Campbell & Co., of Quartz valley, are still running with a good head of water, and the prospect for a good clean-up is flattering, although they haven't got off so much ground as usual, owing to the lack of pressure. As they work higher up the gulch the pressure gets lighter. Mr. A. M. Johnson has put up a new boarding-house at the mine on the Oro Fino mountain, and has put on a full set of hands, and we may soon expect to hear the rattle of the ro-stamp mill reducing the ore. George Tompking struck a pocket in his quartz claim the first of the month, from which he pounded out $400 in one day, and there is supposed to be $1,000 still in the pocket. Some capitalists have bought two ledges in this camp, one known as the Peter Stevens or Italian Pete ledge, consideration, $2,500; and the Thomas Macaulay ledge. On the latter ledge I failed to get the figures sold for.

Shasta.

PLACER GOLD.—Shasta Co. *Democrat*, May 20: Gus Tyler last week sold his placer claim, situated near Copper City, to Lute Bahney. A. C. Ellis, of Windy Camp, was in town yesterday and reports much activity among the miners on Squaw creek. Considerable prospecting is going on, and good property is being discovered. Camden, McGee & Co. have started up operations on the Lost Confidence again, and will commence shipping ore to Denver this week. They have commenced a new tunnel which will tap a large ore body one hundred feet deeper than the upper tunnel. Mr. Stickley informs us that a Red Bluff company has given Ed Hume a contract to run a tunnel at a point about 4 miles north of Mabel postoffice on the Sacramento. The tunnel is calculated to drain about three miles of the Sacramento river, the bed of which is said to be rich in gold.

Tuolumne

NEW HOUSE.—Tuolumne *Independent*, May 23: A new house has recently been erected over the pumping machinery of the Gold Mount Water Co. It is a substantial improvement, and, if well covered with paint, would last many years longer than it will without. Another rich strike has been made in the Soulsby mine, which is said to be better than any heretofore found. Free gold all through the ore and enough rock in sight to last two years.

Trinity.

BIG CLEAN-UP.—*Journal*, May 23: Messrs. Van Matre & Ramm, of the Monte Cristo mine at Deadwood, recently had 62 tons of ore crushed at the Brown Bear mill, from which they realized something more than $6,000, or at the rate of $100 per ton, to say nothing of a large body of very rich sulphurets remaining to be reduced. The gentlemen named are running the Monte Cristo on a lease from the Brown Bear Company and the result shows the mine to be a largely paying one for all parties interested. We learn further that there is at present an immense body of equally rich ore in sight.

FROM NEW RIVER.—Several gentlemen arrived in town this week from New River district, being interested as parties and witnesses in the case of Clifford vs. Ladd & Clements, which comes on for trial in the Superior Court on Monday next. From them we learn that the district is flourishing and is settling down to a lively and prosperous camp. The older mines are working steadily and profitably, while later discoveries are being proven and preparations making for working them according to their prospects. While no great rush has been made to that locality, the prospects are excellent and the district is certain to grow with a steady and healthy growth. M. C. W. White brought in some rock from a recent discovery of Fowler & Co., known as the Mountaineer mine, which prospects well.

DEADWOOD.—Our camp never saw better times than she is enjoying at present. Thomas Simons, superintendent of the Klein mines, is pushing things ahead in a workmanlike manner. About 12 men are now employed and splendid ore is being extracted. Wm. T. St. Auburn is creating lively times on Thorn gulch. A wagon road is nearly finished to the mine and lumber will soon be upon the ground to build a large boarding-house for the accommodation of his employes. Operations are being forwarded at the mine, and latest accounts report everything favorable. Mr. St. Auburn has also purchased the adjoining location in which Frank Mabie and Will Clements, two speculative young men, were part owners. Gibson & Blagrave will soon tap their ledge with the lower tunnel, as very favorable indications are putting in an appearance. Ramm & Van Matre, of the Monte Cristo, are having their ore crushed at the Brown Bear mill. The ore in the mine looks rich, with plenty in sight. The Vermont mine, owned by Mrs. H. Willey, is in splendid condition owing to the skillful work of that "boss miner," Joe Falan. Hurlburt & Bearden, on Eastman gulch, bring down their wages every week in specimens and gold which show up well for their mine. Curt. Blakemore will soon commence operations on his mine and we only hope that its future will be as prosperous as its past.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, May 23: Since last week's regular mining summary the water has been completely subdued, depressed and extracted from the two lower levels, and the big hydraulic pump at the Combination shaft is holding it in complete subjection, without half trying, or, at any rate, without being worked up to its full capacity. The 2,900 and 3,000 levels are being cleaned out and repaired from the effects of the hot water deluging they have been submerged with. Timbers and lagging were found displaced, and debris run in from all sides, but both levels will be placed in just as good condition as before the flood, by Monday next. On the 3,000 level, the main lateral drift north has been cleaned out and repaired as far as cross-cut No. 2, and work has been resumed in cross-cut No. 1, west. This cross-cut is 90 feet north of the Chollar south line, and has been advanced about 50 feet west from the main north lateral drift. Cross-cut No. 2 is about 150 feet further north, and in the north lateral drift from this, it will be remembered, was the last work being done in the ore vein when the flood stopped operations. On the 2,900 level, further ore development work is postponed for the present, on account of bad air and heat, until a new drift or gangway, just started, can be run from the incline winze on the 2,400 level to connect with the Savage incline. The distance is about 160 feet, and the connection will probably be made in three or four weeks. This connection is very important and essential. Meanwhile, the 3,000 level will be all the better supplied with air, and, being much cooler, work can be concentrated at that point to good advantage and with excellent prospects of bonanza success. The proposed air connection will also be of important assistance in deeper explorations, if desired, below the 3,000 level.

BALTIMORE CON.—The new roasting furnace will be completed about next Tuesday ready for firing up, and next in order will be the hoisting of the ore stored in the drifts on the 450 level, which has been accumulated by the tributers working at and below that point. This will only be hoisted as required for milling and roasting. It is all rich ore, $100 per ton and upward, and will be dry crushed in the five-stamp mill near the works, and roasted in the furnace with the proper proportion of salt to chloridize it. This ore has to be thus worked by the dry chlorination process by reason of a large proportion of it being ruby or antimonial silver ore. The vein is from about three to a dozen inches in width, and they have followed it with a winze 70 feet below the 450 level, drifting laterally and stoping it out at that depth. They propose opening it from the 600 or 700 level also, through the main shaft. The parties working on the 225 level are still sinking a winze following the vein, which shows very well.

CON. CALIFORNIA AND VIRGINIA.—On the 1,750 the south drift has been run through to connection with the 1,700 Gould and Curry drift, and a cut is being driven across the old burned-out stopes to cool the ground. Five hundred and thirty-eight tons of ore were extracted from this level last week, worth $16 per ton. From the old stopes between the 1,550 and 1,200 levels, under the Jones lease, 1,040 tons of ore were extracted last week, the average assay value being $15.63 per ton. The ore stopes are holding out well, and show no signs of exhaustion. The machinery of the Con. Virginia shaft is being put in order, and preparations made for repairing the shaft.

BULLION.—The parties engaged in prospecting the croppings are getting along very well with the work. Their whim at the old Fairview shaft operates finely and does all the required hoisting.

CHOLLAR.—Owing to the work of cleaning up and repairing the 3,000 level resultant upon the flood no ore development work has been done.

BEST AND BELCHER.—The north lateral drift on the 1,000 level is being repaired and advanced, and common report locates a big bonanza as being long known and about to be developed in the 1,200 and 1,300 level regions of this mine. But common report lies like blazes sometimes.

YELLOW JACKET.—The munificent yield of fair grade ore from the old upper workings still continues, with no particular change to note. The stopes about the 400 level, or "frog pond," are represented as looking and yielding particularly well.

OPHIR.—The upraise from the 500 level, to connect with and drain the old Mexican shaft, is making good progress. A west cross-cut from the main north lateral drift has been started in connection with the Mexican Company on this level.

MEXICAN.—A west cross-cut has been started on the 500 level, conjointly with the Ophir Company, and is making good progress. The joint Union and Mexican drift on this same level is going ahead well in good working ground.

GOULD AND CURRY.—From the main lateral drift south on the 1,000 level a cross-cut east has been started near the Savage north line. It is also proposed to cross-cut west and intersect a promising ore vein found in the level above.

ALTA.—The prospecting stopes above the 950 level still continue yielding a small amount of fair grade ore in spots and bunches, which are being saved for reduction.

OVERMAN.—Some pretty fair bunches of ore are being found in the low-grade reserves being raided into on the 226 level. About a dozen tons a day are being extracted.

KENTUCK.—The daily yield of low-grade ore has fallen off a little, so that only half the stamps of the Rock Point mill on Carson river are kept employed.

SIERRA NEVADA.—The north lateral drift on the 520 level is making steady progress northward in good working ground.

WOODVILLE.—Tributers have resumed work on the 400 level of this mine during the past week.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, May 23: The west drift, on the sixth level, has advanced 74 feet during the week, and the winze to meet this drift is down 113 feet. The west drift on the third level is looking well. The intermediate stope, between the second and third levels and west of the shaft is giving the usual amount of ore. A bullion shipment of $13,215.45 was made on the 15th inst.

Eureka District.

LOOKS DECIDEDLY BETTER.—*Sentinel*, May 23: The Eureka Con's new reduction works were started up yesterday, and from the first everything worked satisfactorily and smoothly. With two of the Richmond furnaces at the upper end of town in full blast, and the Eureka Con's at the lower end of the town in like active operation, the business air of the community again assumes tangible form. Both works are well supplied with ore, and the probabilities are there will be no cessation of such work for many months to come. The Richmond company have in their mine a good sized body of ore which they will doubtless begin to extract before many days, or just as soon as they require any at their works, while the Eureka Con. property is looking better than it has at any time in the past two years. Considerable dead work has just been completed in the mine between the sixth and seventh levels close to the Williams pitch, in order to get air, and at the same time to better facilitate the working of the body of ore, which has now the appearance of being considerably larger than it was a month ago believed to be. Other pitches in the mine are also said to look well. Altogether, while our people are not, from even the present outlook, justified in expecting a boom this summer, yet they can feel assured that the town will not get any duller than it now is.

PROGRESS.—Eureka *Sentinel*, May 21: During the past week mining has looked up some little throughout Eureka district. Work has been resumed in several old claims in which operations were suspended some time ago. Hon. Thomas Wren is again working his Mt. Hope properties, and several tributers are now at work there with a most excellent prospect of doing better than if they were working for day's wages. H. W. Hhising, of Cincinnati, who owns some excellent properties on Prospect mountain, has put a force of men at work in the Silver State, and although they have been working but a few days, the prospects already shown are said to be flattering. What was believed to be an average sample was taken from a streak of ore which was followed from the surface down several feet, and an assay of the same was made, which went over $500 a ton. While it may in itself not amount to a great deal, it evidently is a feeder to something larger and of greater value at a lower depth. The smaller mines of the district continue their shipments without any tendency toward a falling off in the amounts. We were unable yesterday to obtain anything like a full list of the producing properties, and the amounts of ore shipped to the two furnaces here the past week, but from what intelligence of the character we did get we feel justified in believing the yields are gradually increasing. The Hamburg mine, in New York canyon, shipped to the Eureka Con. 12¾ tons, the Bowman mine, on Adams Hill, sent to the same works 10¾ tons, and

from the Lord Byron, on Prospect mountain, was shipped to the Richmond furnaces some 30 tons. In the last-named property, on the tunnel level and near the old shaft an engine has been set, which works first-rate and fully up to the expectations of Supt. Kermeen, but before it can be utilized to hoist ore from the lower levels some work is necessary to be done in the lower part of the shaft, which, it is hoped, will be accomplished during the coming week. The shipments from the property will then probably increase, as most of the ore being sent in from it comes, we believe, from below the tunnel level. The Silver Lick mine, on Adams Hill, sent in 25½ tons to the Eureka Con. works; the Summit, on Prospect mountain, which adjoins the Banner, shipped 10¼ tons and the Fraser & Molino, 4¾ tons. The Morning Star, an extension of the Macon, on Adams Hill, shipped to the Eureka Con. works 9¾ tons, and the Hoosac, on Prospect mountain, made a shipment to the Richmond works. The Lone Pine, another Adams Hill property, sent to the Eureka Con. works something over four tons, and to the same works was shipped from the Eureka Tunnel, on Prospect mountain, 3¼ tons. The old Continental mine, near Hamilton, made a shipment of ore to the Richmond works, and the property is said to be looking quite promising and evidently fruitful of further shipments. There is nothing particularly new to report of the Eureka Con. or Richmond mines. Both of the properties are looking and yielding well.

Tuscarora District.

NAVAJO.—*Times-Review*, May 23: Fair progress has been made with the work at all points on the 650-foot level. The upraise has been carried up 25 feet the past week. The usual progress has been made with the work elsewhere in the mine.

GRAND PRIZE.—The machinery at the hoisting works has been thoroughly repaired and is now in good running order. The timbers in the shaft immediately above and below the 200-foot level have been eased and the shaft straightened. The 200-foot level has been timbered and they have commenced hoisting ore from it and putting it in the mill. Repairs in the mill will be completed about the first of June, when the milling of ore will be resumed.

Taylor District.

LIVELY.—Cor. Eureka *Sentinel*, May 23: The mines of the district continue to look splendid, especially the Monitor and Argus, both of which turn out the usual amount of high-grade ores. Our two mills are hammering away, and as you know our bullion shipments are large and regular. The business men of the town are kept busy, and are making improvements on their respective places of business.

Wild Rose District

PARADISE MINES.—*Silver State*, May 2: Frank Gregor, down from Paradise mines, reports everything quiet at Spring City. Work is being prosecuted on the Paradise Valley, Wild Goose, Bullion of Paradise and Glory mines, and all are looking well. The Glory, which is located a mile and a half from Spring City, is developing into a very promising mine. The lead now ranges from 1 to 2 feet in thickness, and the ore is very rich. Should this lead continue to yield as rich ore as it now does, and there is no known reason why it should not, it will encourage prospecting in the vicinity, which may result in the development of new mines equal in richness and extent to those now being worked on the west side of the canyon, in the immediate vicinage of Spring City. Near the Glory is a claim known as the Rattler, owned by miners who have no capital but pluck and muscle. They work at whatever they can get to do a part of the year to earn money to purchase provisions and tools to enable them to develop their mine another portion of the year. They have faith in their claim, because they are practical miners and know that it has the characteristics of other mines in the district, which have proved valuable. Former owners found a body of very rich ore in it, and experience has shown in the Bullion of Paradise, Paradise Valley and Wild Goose, that where rich ore is found in small quantities near the surface, more extensive and richer ore bodies abound at a greater depth.

Washington District.

TUNNEL.—Belmont *Courier*, May 21: Uncle Billy Koch is hard at work running the tunnel in his mine at San Juan, Washington district. He has cut through two ledges that carry ore of a low grade. He expects to tap the main ledge in a few weeks, with the hope that the ore will prove of a better quality. In the early days of Nye county considerable work was done in Washington district, but the ore proving of a rebellious character the mines were abandoned, and until a few years back have attracted no attention. There is one patented mine in this district—the St. Helena—that show a big ledge of this rebellious ore. Experts think that with the improved reduction facilities of the present time, the ores of this district ought to be profitably worked.

ARIZONA.

GENERAL NOTES.—Clifton *Clarion*, May 20: The hoisting machinery and engine will be in place this week at the Detroit. A great deal of lagging has been brought to the Longfellow recently from the vicinity of the Coronado mine. The Alaska continues to look well. On the second level last Saturday they struck a fine body of 30 per cent ore. The copper ore in the Morning Star is a high-grade black oxide. Parker & Whalen are getting out the same to sell to the Arizona Copper Company. Numerous ore platforms are being constructed on the line of the Coronado railway, on which ore will be deposited by pack trains from the King and other mines. The claim "7.30," recently opened near the Queen, that native copper was struck in last week, continues to produce the same. It belongs to the Arizona Copper Company, and was opened in the bed of Chase creek. Brown & Cole, the lessees who are working the El Paso, in the face of the 100-foot tunnel, have struck the body of ore which was uncovered on the surface 80 feet above. The ore is black oxide, carrying a strong trace of gold. Mathison & Morris have completed their contract of building a wagon road to the White Hawk mine from the Metcalf, three-quarters of a mile in length, and are now hauling ore to the head of the incline. They have a contract to deliver 2,500 tons. The White Hawk belongs to the Arizona Copper Company. The ore is quarried, not mined, and is of an exceedingly good grade. Mr. Wm. Bonnell has struck gold-bearing rock of the same quality as that found in the Morning Star on a claim recently located by him in the same vicinity, and distant from it 3,000 feet. What work he has done to date has developed a vein of free milling gold ore the width of the shaft.

SOUTHERN PIMA.—*Beef and Bullion*, May 20: At Arivaca, Messrs. Untbank and Whitmore have the road to their mine finished. Their mill will start about the 15th inst., to work custom ore. Good ore is now being hauled to the mill. The Con. Arizona mine and mill closed down a few days ago, leaving only a man to pump water from the mine, which is down 240 feet. Mr. Joyce, the superintendent, who was sent from the east to inspect and straighten matters out, has gone to New York, having paid out $25,000, and put everything in order. He will soon return, when another 100 feet will be sunk on the mine. The company has been reorganized, and is now known as the "Mutual Arizona." They have plenty of ore in the mine that will average $80. The mill has five stamps.

COKE.—*Silver Belt*, May 23: Dr. Alex Trippel, superintendent of the Old Dominico Copper Co., received a telegram on Monday conveying the pleasing news that shipments of coke would begin on that day. Further information is expected by letter. The shipment of coke at this time is assurance of an early resumption at the mine and smelter. J. C. Jones is still driving the tunnel in the Cross-cut mine and is now in about 100 feet with favorable prospects for a good permanent mine. The ledge shows up the full width of the tunnel and all ore. This mine is conveniently situated, being only about 3 miles from the Miami mill, with a good wagon-road right to its mouth. E. F. Kellner & Co. have contracted with J. M. House for the hauling and milling of a large quantity of silver ore from the Rouse & House mine in Tonto Basin. This arrangement will doubtless give other miners in that vicinity an opportunity of sending ore to Globe for reduction, which it is hoped they will embrace.

COLORADO.

ELK MOUNTAIN.—*Pilot*, May 21: Work has been resumed on the Forest Queen mine with a full force. The death of Prof. Ridgley caused the cessation of work for a few days. We understand that they have about five carloads of ore ready to ship just as soon as the road will permit hauling. A. W. Anderson is home from Aspen, and will work his property on Brush Creek. Henry V. Meloy, the superintendent of the Richmond mine, was the first superintendent to venture into Poverty gulch and Dark canyon this season. He made a trip to the Richmond mine last week, withstanding the perils and hardships incident to a trip in that locality at this time of the year.

CRYSTAL CITY.—The deep snow keeps prospectors from going into the carbonate belt and the district between here and Aspen. Work is being steadily pushed on mining property around Rock Creek hot springs. Squire Beardsley was down from the Detroit, and reports the mine looking well. He has struck a good body of galena ore. Jim Sprague is assisting him and they are pushing work. The Sunshine property is showing way up. It is one of the best properties this side of Sheep mountain, carrying copper and galena. The Grand Republic vein will be cut in about 25 feet, when we may expect to hear of a good strike of gray copper ore. Bob Cory's property is being put in shape to be developed by a tunnel, and shows a vein 15 feet wide. When he gets this vein opened up it will be one of the best on Rock creek.

IDAHO.

MINERAL MITES.—Houston *Press*: The boys working on the Alice say the hill in which the mine is located is simply a mass of mineral. The Sullivan mine is in good ore, and the chance for striking the main ledge is good. The Ada prospect is coming to the front and bids fair to soon be entitled to be called a mine. The Superior will begin taking out ore in a few days. The Louisa property is being prospected. The Isabelle will be worked for ore as soon as the smelter starts

SOME OF THE PRINCIPAL GULCHES.—Wood River *Times*, May 23: The active season being about open it behooves us to look into the prospective yield of the mines, upon which our prosperity depends. In Resurrection district, 15 miles south of Hailey, mines are opened which will probably compel the erection of a mill this season. Hon. John Hailey, the principal owner of those mines, will be here in a few days, and if he concludes to have a mill at least 50 men will be employed there this summer. Along the range forming the eastern boundary of the valley to Bellevue—on the Queen Victoria, Deadshot, Monday and other ore-producing claims—probably 25 men will get steady employment. At the Minnie Moore, Queen of the Hills and other Broadford mines probably 150 men will be steadily employed. In Colorado gulch and adjoining localities 25 men will be employed. On the opposite side of the valley and up Quigley and Indian gulches at least as many more. Up Croy gulch to the head of Rock and Camp creeks the possibilities are great. There are the Chief of the Hill, Japan, Belleisle, Climax, Fearnaught, Black Prince, Ornament, Ohio North, Ohio South, Bismarck, Oriental, Montezuma, Guy, Camas Nos. 1 and 2, and a large number of other claims which have already yielded considerable quantities of ore, and which will greatly improve on former shipments. If the mill now building for Camas No. 2 treats the ore successfully it is possible that 500 men may find employment on the gold belt alone within the next 3 months. If the mill does not make a success the smelting ore claims will employ about 50 men all told. Kelley gulch will continue to yield small quantities of good ore. So will the Idaho Democrat, above the Warm Springs. At and near Bullion things look decidedly favorable. The Idahoan company is going to have "the bottom knocked out" of their mine this year, and all of 100 men will be required to do it and they will probably only succeed in uncovering more ore than is in sight now. At Bullion, the Bullion-Ophir and Mayflower deep tunnels are just getting into the vicinity where they expect to strike ore. No mining man doubts that ore will be found there in larger quantities than ever. At all events, even if no new body is found there is plenty of ore in the upper levels that must be extracted and shipped. The O K, Point Lookout, Valley View, Mountain View, Bay State and other claims will all resume their shipments soon and continue all summer. The Eureka is said to be a better mine than the Bullion ever was. The same is true of the Ophir. Bullion and vicinity may therefore be reckoned on to give employment to between 250 and 300 men. Deer Creek will assuredly come to the front. The Montana and Snowfly claims of the St. Louis and Idaho company are showing up immensely; the Bullwhacker, Wolftone and other well-known claims will remain in the ranks of ore-producers; the Davitt will do likewise, while the Narrow Gauges, Bannack, Robert Emmet, French Boys' Group and others will ship large quantities. The Cyclons, back of the Narrow Gauges, will undoubtedly make heavy shipments all summer. Up Greenhorn gulch, Milton Pinney's claims will do even better than last year. On the East fork the North Star concentrator will work all summer, while the Triumph group will doubtless pay good dividends. Other claims on the fork will also ship ore to market. In Elkhorn gulch the Elkhorn, Parker, Quaker City and other claims will ship steadily all summer, while other Trail creek claims will probably follow suit. Up Warm Springs creek there are four smelting furnaces, two concentrating works and a large number of claims whose aggregate yield this year will not fall short of $1,000,000. Boulder creek, the home of Judge Beatty's ophir and other high-grade claims, will probably turn out no inconsiderable quantity of ore. At and around Galena at least 75 men will be steadily employed. At and near Vienna 150 men should find employment, and the output this year approximate $1,000,000. At and near Sawtooth the yield should reach $250,000. The Smoky districts will doubtless ship $300,000 worth of ore this summer if the wagon-road can be completed in time. Enormous dumps are awaiting transportation to market. The above is a very moderate estimate of the probabilities of this region in the mining line this summer and fall; but it will suffice to demonstrate that the outlook is really more favorable than at any time before since the first settlement of this region by the whites.

MONTANA.

STRIKES.—*Inter Mountain*, May 23: The principal events that have marked the progress of mining in this district during the past week are important strikes in the Elm Orlu and Springfield, and on the north vein of the Valdemir, and the completion of the Alice shaft, to the 800-foot station. The Elm Orlu strike, though as yet but a surface showing, is netting its owners $600 daily clear of all expenses. The development of the Springfield is not yet thorough enough to determine the exact size and richness of the strike, but the ore, as far as explored, is of very high-grade, and is solid and clean, over a foot of it assaying upwards of $500 per ton. The importance of the strike on this property is destined to have an excellent effect on contiguous mines, and stimulate hope in their future.

THE LITTLE ROCKIES.—Scarcity of water is preventing effective work in the Little Rockies this spring. At the head of the Little Horn parties are engaged in building a reservoir, which, it is thought, will furnish water enough for sluicing about four hours per day. On People's creek gold is being taken out at the rate of $2.50 to $3.50 per day to the man. Work has been suspended on the deep diggings for the present, but will be resumed later in the season. On Rock creek there is a scarcity of water, but in Little Alder money is being taken out constantly, $1,700 having been shipped from there recently.

IN THE SWEET GRASS HILLS.—The *River Press* says that paying mines have been found in the Sweet Grass hills, and are now being worked. They were discovered last fall by four men, who have kept it secret until now. The discoverers say that the diggings will yield from $5 to $7 per day to the man. The new find lies near the British line, about 80 miles from Benton.

MISCELLANEOUS NOTES. — The new Gregory shaft has reached a depth of 135 feet. The Drum Lummon managers estimate an output of $100,000 as the total for May. Last week the Northern Pacific Express Company and the freight department of the road shipped $150,000 worth of bullion from Helena. On Tuesday Charley Colter took to Helena 40 pounds of gold retort, the result of a 15-days run on ore from the Bluebird-and-Hickey mine, 15 miles from Helena. The districts of Pony, Red Bluff and Richmond, Madison county, are coming to the front. Twelve tons of ore from the Grub Stake mine, sent to Omaha for reduction, yielded $2,420.26 net. It is reported that a marvelously rich strike was made last week in the 500-foot level of the Elkhorn, and A. M. Holter says there is not enough money in Montana to buy the mine now. On the Parker and Griff mines (situated on the same lead as the Bald Butte, 15 miles west of Helena), five 100-foot shafts have been sunk, showing a narrow streak of very rich ore, which assays from $5,000 to $9,000 per ton, and a 4-foot body of $40 ore.

NEW MEXICO.

THE PROGRESS OF THE SMELTER.—Rio Grande *Republican*, May 23: The smelter site presents a scene of life and animation. Over fifty men—mechanics, builders and laborers—are rapidly getting everything in order to begin the reduction of ores. The walls of the offices and laboratory are raised and ready for the roof, and those of the main building and engine-room will be completed this week; brick layers are at work on the chimney which will be 80 feet in hight; the engine and machinery are all in place, and both the galena and copper stacks will be raised next week. Ties for the side track are being unloaded, and this will be laid immediately. The ore bins are being filled with ore from the Jay Gould, Bennett and other mines of Organ, and within a space of time that has narrowed down to a few weeks the plant will be producing bullion.

ORE. — Silver City *Enterprise*, May 22: A car shipment of ore from the Old Man was taken to Deming on Monday by Chas. Seldomridge, son of the president of the company, who is spending the summer at Fleming.

THE LEASERS of the Novelty mine at Gold gulch are taking out a large amount of rich ore, and making considerable money in the development of the ledge. The lead has widened with every foot of work done upon it, and sinking is being pushed as rapidly as the nature of the ground, which is very hard, will permit.

SHIPMENT.—E. A. Anderson, who has the Malapais mine, at Gold gulch, belonging to Dorsey Bros. and Conway, under lease, made a shipment of 4,400 pounds of rich ore on Saturday to the Deming sampler. Regular shipments of 150-ounce ore will hereafter be made from this claim.

APACHE DISTRICT, in the southern part of the county, is attracting the attention of prospectors. They are flocking in there from every direction, and some are finding very encouraging surface claims. The mines being developed in the district are looking well, and regular shipments of ore may be looked for hereafter.

OREGON.

HEATH DISTRICT.—Bedrock *Democrat*, May 18: We received a call yesterday from Mr. Boggs, of Mineral City, who has lately been on a trip to Heath district, about 60 miles northeast of the Baker across Snake river, near Brownlee ferry. He presented us with a sample of galena ore from the mine of Summers & Wilkinson, which is the richest ever before seen in any country. This mine is situated in the same belt of mineral as that of the Ruth and Seven Devil districts, and has been prospected on an incline shaft to the depth of 80 feet and then by several cross-cuts. The vein at this depth is 17 feet between walls, and the ore becomes richer all the time. Adjacent to this mine are various other discoveries with more or less development made upon them which indicate vast richness. The mines of Ruthberg are receiving considerable development this year, and the discoveries are turning out richer than ever. Jas. Ruth, the original discoverer of this district, is pushing with all the energy possible the work of development on his several locations. It will be remembered that Mr. Ruth last summer disposed of one of his locations to California capitalists, receiving therefor the snug sum of $20,000. The parties buying this mine contemplate the erection of a mill upon this property the coming summer. At Mineral City, situated in the same belt of mineral as that of the Ruth, Heath and Seven Devil districts, is receiving quite a boom in mining this spring. It is attracting the attention of capitalists from abroad, and we would not be surprised to hear that one or more mills were put in operation there before the summer is over. If mining men desire to find the place they have been searching for so long, let them pay a visit to Mineral City and they will not be disappointed. The Black Maria mine has been developed to a depth of 120 feet with cross-cuts of 15 to 20 feet on each side, showing a fine body of ore. The owners of this mine are Messrs. Boggs & Landy. The Daniel Boone, Jolly Traveler, and numerous other discoveries are being developed extensively this spring, and all show great richness. Copper discoveries have also been made in this district, one, the Minnesota Chief, showing ore that has been assayed as high as 68 per cent copper, 19 oz. silver and $7.50 in gold. Three miles south of Mineral, on Wolf creek, discoveries have been made of galena and black sulphurets, one assay going as high 1,730 oz. silver to the ton. The belt of mineral in which all these discoveries have been made will prove some day to be the richest in the world. Mining men from abroad visiting there are amazed at the extent of the deposits of ore, and it is certain that some day the greatest boom in mining that has ever occurred will take place in this country.

PROSPECTING.—Jacksonville *Times*, May 23: Geo. Stephenson, of Ashland, took a couple of mining experts from California to Applegate this week. They propose prospecting the Steamboat district thoroughly. J. D. Shearer and W. E. Finney, of Steamboat, found a nugget of gold worth over $50 not long since. The latter brought it to town last week and sold it to Bilger & Maegly. Geo. H. Chiek, of Portland, the well-known mining expert, having leased the Morse & Jacob's quartz-mill at Henley, Cal., is now prepared to test gold and silver ores with his process, and guarantees to work any ore in this county to 85 per cent of fire assay. Miners should read his advertisement elsewhere. Considerable mining is yet going on in the Steamboat mining district. Finney & Prickett are rigging up a derrick with which to hoist the boulders out of their claim by water-power. Caldwell & Son are still piping with a fair head of water. Sargent & Co. are also busily at work, as are several others. That camp promises to be one of the best in this section in the near future. Capt. Arken is still sojourning at the Sterling mine, and will remain some time yet. It is the intention to build an immense reservoir there, to catch the surplus water, which has heretofore gone to waste, and work will be commenced at once. Plans were received from California last week. The reservoir will, no doubt, be one of the largest on the Northwest Coast. It will enable this company to run six months in the year, and insure profitable returns. The Sterling Mining Co. is to be complimented on its enterprise.

UTAH.

CHLORIDERS' CLEAN-UP.—Southern Utah *Times*, May 23: During the past week several of the chloriders at work on the river and white reefs have enlivened the town with their presence, they having had a "crushing." We are informed that the results obtained from their ores have been highly satisfactory to the men in most instances. The men have mostly gone back to the scene of their labors, and we shall not expect them back in force until they have another clean-up.

THE STORMONT COMPANY.—The Thompson furnishes five tons of first-class ore for the mill every day. The mines worked through the Buckeye and Savage shafts are looking well, and are producing about forty tons of ore daily.

THE CHRISTY COMPANY.—The Stormy King is producing eight tons of first-class ore daily. The mill, during the past week, crushed 41,642 tons of ore daily, and we learn from good authority that the ore pulped higher than at any time since the company resumed operations last fall. At present, the stopes are being worked on the third, fourth and fifth levels in the California, out of which thirty-five tons of first-class ore are sent to the mill every twenty-four hours. Prospecting is being vigorously pushed in different parts of the mine, and the indications throughout point to the fact that the California, in the near future, will surpass her production in the palmy days of the Reef

THE GIANT POWDER COMPANY

Manufacture Three Kinde of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynnmite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blesting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and eaves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO, CAL.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any othe Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutraliz the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who oppoced him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to anv powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

GOLD QUARTZ and PLACER MINERS'

SILVER PLATED AMALGAMATING PLATES

FOR SAVING GOLD,

Have been Awarded the First Premium at Mechanics' Fair for the Last Thirteen Years.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 3,000 ORDERS FILLED!

References from every purchaser. Full weight of Silver guaranteed on every order.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought or gold separated for low percentage of result.

....SOLE MANUFACTURERS OF....

KENDALL'S PATENT QUARTZ MILLS.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that is claimed for it and give entire satisfaction.

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A Glance Over the Mining Field.

The Butte, Montana, mills and smelters are working ore at the rate of 1,600 tons every 24 hours.

The total disbursements of the Ontario mine, Utah, last year were $2,413,914, of which $975,000 was paid out in dividends.

The Moulton mill at Butte, since its late reduction in custom rates, has its ore-house full to overflowing with ore for custom treatment.

Several parties from Austin are working on claims they have bought or taken up at Bernice, Nev., and all express the opinion that the camp is a second Austin.

George Lovelock shipped a carload of nickel and cobalt ore from the Cottonwood mines last week. The ore, which is shipped to Europe, is worth about $140 per ton.

The Omaha and Grant Smelting and Refining Co. took out of ore for the year 1884 $13,751,185, of which $1,600,000 was gold. This is a very large showing for one concern.

The Mahoney mine, Sutter Creek, Amador, after starting up ran only three days, when work was again stopped, pumps disconnected and the mine allowed to fill with water.

A number of mining camps are desirous of having sampling works. Hundreds of men would work in many places where they are now idle, if they could realize on their quartz.

The new company operating in Hiko, Nev., is pushing work ou its property. The mine is presenting a better appearance at the present than anticipated. About 14 men are employed extracting ore. The mill will soon be in readiness.

The little 5-stamp mill owned by the Ferrington Brothers, situated in the Garfield district, says the Eureka *Sentinel*, continues to ship hullion constantly, steadily and in large amounts. Two shipments per week are the average, and each is valued at from $6,000 to $8,000.

About 40 Chinamen are working the placers at Spring Valley, Nevada. Water is scarce and the Chincse burrow underground and get the rich gravel from the hedrock without disturbing the surface. They have honey-combed a large area in that way, and wash the gravel extracted in rockers.

The smelter at Cliff, Idaho, will soon be blown in on silver ores. This will give scores of prospectors who have small quantities of ore on the dump an opportunity to realize sufficient cash to enable them to go ahead with development work. It will also give an impetus to the large producing mines in the vicinity of Houston.

During the quarter ending March 31st, the small mines of Eureka county, Nevada, produced and worked over 11,000 tons of ore, the gross yield or value of which was about $210,000. Most of the small mines are worked on a very limited scale hy leasers and tributers, and hut few of them are worked below a depth of 150 feet. Tbis speaks well for the county when one cnnsiders the depression which has overtaken the mining industry of the Coast.

The new reduction works of the Eureka Con. Company are fast approaching completion. While the new plant will have for a while hut one furnace, yet in other respects it is extensive and probably one of the most complete on the Pacific Coast. Should the future justify the erection of additional furnaces the location of the present one is such that new ones cau he readily and practically added.

When Geore D. Roherts, the famous mining operator, was on the Comstock a few years ago, in speaking of Leadville, he said it was just as rich and flourishing a place as ever, and that more bullion was taken out of the mines there last year than in any one previous year. At the head of California gulch, within the borders of the town, another heavy vein or deposit of rich carbonate ore has recently heen struck at a depth of ahout 200 feet.

On the 18th inst. a fire broke out at the original Keystone mine, three miles north of Virgioia, on the road to Reno, entirely destroying the hoisting works, extensive huildings and machinery. The large boarding-house and office of the company, also the wagons and harness, were savcd. No work has heen done on the mine for the last five years, and it was in charge of a watchman, who thiuks the fire was the work of an incendiary.

EXPLANATION.—Cl, for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

Mining Share Market.

Stock dealers here continue to await developments on the Comstock, more particularly in the middle mines. The water is out again and the men are at work cleaning out the lower levels of the Hale and Norcross. Now the proposition is to go ahead with the promising ore development found in those lower levels. On the 2,900 level of the Hale and Norcross it is not deemed advisable to do much at present because of lack of air circulation and other difficulties, but on the 3,000 level, where the ore development was the most interesting, the best results may be looked for from work resumed. While cross-cutting west to prospect and work the valuable ore vein at that point, it is under consideration to run the main north lateral drift further north, in order to intercept the ore vein from the level above. Perhaps even deeper sinking may be deemed necessary in order to further practically develop the present prospect, but this will be a matter accomplished with good facility and at comparatively small expense, as the present plant of machinery of the Combination shaft is fully sufficient to sink the shaft 500 feet deeper, if required, and to keep the mine well drained.

At the south end the Yellow Jacket Crown Point and Belcher continue their large yield of fair-grade ore from the old upper levels, employing between 600 and 700 men. Low-grade ore is being yielded by the Woodville and the Overman, and some very high-grade ore is found in the Baltimore. The *Enterprise* says that this is found in a small, narrow vein of a few inches in width in the midst of the great Comstock ore belt, which at that point is several hundred feet in width. But the most phenomenal part consists in the fact that this little vein or ore streak partakes considerably of the character of the famous "razor blade" ore veins of Reese River district, not only in size but in ore itself. Ruby or antimonial silver enters so largely into its composition that, unlike the general free-milling ores of the Comstock, this requires to be worked by the dry roasting chlorination process. Some specimens of the genuine ruby silver from this peculiar vein assay high up in the thousands per ton. Ruby or antimonial silver has also been found in the Justice mine and others at the south end, but very little, if any, in the northern section, except as mixed with the base ores of the Ophir and some other mines. This vein is distinct in its general characteristics from all other ore streaks on the Comstock.

THE workingmen, at a meeting in Quebec, Montreal, passed a resolution requesting the Government to prohibit the importatioo of Chinese lahor into the Dominion.

Following were the ore and bullion shipments out of Salt Lake during the week ending 24th inst: Eighteen cars of bullion, 453,772 pounds; twenty-eight cars of ore, 792,610 pounds; one car of copper ore, 26,300 pounds.

TRAVELING REPRESENTATIVE, FRANK W. SMITH, formerly of this city, now traveling representative of THE MINING AND SCIENTIFIC PRESS, arrived on this afternoon's train from San Francisco. Frank has recently returned from a 3-months' tour of Arizona, New and Old Mexico mining districts and is now en route to Shasta, Trinity and other northern counties. He will write up the merits of the various mining districts for that ahle authority on mines and mining, THE MINING AND SCIENTIFIC PRESS. His writings ou southern mines and on mining matters have heen copied extensively by the press, and our home capitalists as well as mining men throughout the Coast will read his observations on our neighboring 'counties' mineral resources with interest.—*Red Bluff Peoples' Cause.*

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING MAY, 19 1885.

317,983.—PURIFYING WATER FOR BOILERS—Chas. Elliott, S. F.

318,425.—APPARATUS FOR STORING OIL, ETC.—A. J. Gould, Quincy, Cal.

317,998.—MEAT SAFE—Mary J. Holt, S. F.

318,115—RULE AND PENCIL POCKET—Hunt & Bressler, Crescent City, Cal.

318,117.—CENTRIFUGAL CRUSHING-MILL—F. A. Huntington, S. F.

318,006.—FUSE CUTTER—J. M. Martin, S. F.

318,200.—WINDOW SHELF—J. G. O'Neill, Nevada City, Cal.

318,133.—BATHING SUIT—J. J Pfister, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ARTIFICIAL FACING BLOCK FOR BUILDINGS. Henry G. Fieke, S. F. No. 317,107. Dated May 5, 1885. This consists of a framework of considerable size, made of longitudinel parallel strips having other strips nailed to them transversely near the ends, so as to form an open central space, these strips being built up to the desired hight for the block end afterward having the end filled in with a compound of concrete or artificial stone.

CARTRIDGE.—Wm. Suhlett, S. F. No. 317,041. Dated May 5, 1885. This invention relates to an improved method of loading shot-guns or shot-cartrides, and it consists in the employment of metallic or other weds and a metallic cylindrical case with sides either opened or closed, within which the shot are contained and kept together until after they leavs the gun. The shot are kept in a compact body some little time efter they leave the gun, which increases their range and penetration.

PAVING BLOCK.—Henry G. Fiske, S. F. No. 317,108. Dated May 5, 1885. This sidewalk or paving block consists of strips of hoard or other material laid horizontally side hy side to produce the desired length and width, a series of strips laid transversely ahove, these layers being continued until sufficient thickness is produced. Between and around these layere is a filling of asphaltum and coal-tar, which binds the whole together, and the exterior of the block so composed may have a permanent surrounding strip if eo desired.

GRIP FOR CABLE RAILWAYS.—Wm. A. Burke, S. F., assignor of one-half to F. Patek. No. 317,619. Dated May 12, 1885. This is an improvement on the grips for ceble roads, hy which connection is made between a car and an endless traveling rope moving in the tube heneath the street surface. It consists of a mechanism hy which the gripping jaws are caused to approach each other and a means for more perfectly protecting the working parts from dirt or injury.

PENCIL AND RULE POCKET.—J. W. Hunt and J. Breseler, Crescent City, Del Norte Co. No. 318,115. Dated May 19, 1885. This is a pocket or casing for conteining a carpenter's rule and pencil, end adapted to he secured to the overalls or working trousers in any convenient position. The invention consists in a metel pocket or casing edepted to receive the rule and pencil, and secured to a suitably folded piece of fahric, hy which the device is attached to the overells. This pockct can he readily secured to overalls or trousers in a convenient position, and adjusted, when necessery, to a new pair.

BATHING SUIT.—John J. Pfister, S. F., No. 318,133. Dated May 19, 1885. The patent covers a novel knit bathing suit as a new article of manufacture. It consists in a suit, one of the hody together with one leg and stocking of which are knit in one continuous cylindrical piece or strip, and united down the hack to the other half of the hody, which, together with the other leg and stocking is knit in a similar menner. Arm holes are cut on the body for the reception of the sleeves, and a peculiar auxiliary flap covers the shoulders end extends a short distance down the hack and front.

SUPPORT FOR CENTERS FOR MASONRY ARCHES.—Chas. H. Ackerson, S. F. No. 317,072. Dated May 5, 1885. This is a means for supporting the temporary centerings upon which masonry arches are huilt; and it consists of links which are fitted to hang from the edges of the girders between which the archee are built, and to support the ends of the temporary arches so that they are suspended from the girders. Mr. Ackerson has links adapted to receive the ends of the temporary arch-pieces of masonry centerings, and having their ends hent so as to hook upon and he supported hy the flanges of the girders hetween which the arches are built.

SIDEWALK AND PAVING BLOCK.—Henry G. Fiske, S. F. No. 317,106. Dated May 5, 1885. This consists of an asphaltum or concrete block, either with or without en interior framework of wood, and a supplemental outer coating or covering nf stone, which mey be applied to ths top and sides of the block. The present invention is an improvement on a former ono patented by Mr. Fiske, in which a framework of longitudinal and transverse strips is united togethsr and surroundad and filled with a compound of rock or gravel and asphaltum and coal-tar or concrete, so as to form e paving or sidewalk block. In the present invention an exterior coating of artificial stone is formed, which covers tho top and sides of the block.

RAILWAY STATION SIGNAL. Arthur A. Sprague, San Rafael. No 317,590. Dated May 12, 1885. This invention reletes to a railway signal whereby passing trains may be signaled. It consists of a case supported nn an arm which projects from one side of the station, or other convenient poiut, one end of ths case heing formed with opaque sides and the other end having transparent glasses in tho sides, so that a light which is set within that end may be seen from both sides and ths end. The opposits end contains a frame-work, heving colnred glasses or lenses set therein, and this is operated hy a mechanism connected within the interior of the ollice. In connection with this lamp similarly colored siguel boards or tsrgsts are employed, which are also connected with the same operating mechanism, so that they will be moved in conjunction with the glasss.

SEED-SOWER.—Jacob Price, San Lsendro. No. 317,013. Dated May 5, 1885. This is one of that class of hroadcast scsding machinss in which a rotating distrihutor receives its grain from a hoppsr and dischargss it over the ground. The invention consists in its peculiar construction and arrangsment with relation to each other of the hopper, the rotating distrihutor and the elevator. It also consists in dstails of construction relating to the regulation of the feed, to the hase frame of the machine and to the manner of its attachment to the wagon, and to the gearing devices hy which power is transmitted from the wagon to the elevator and distrihutor. The object is to provids an easily hendled seeder, and one capable of doing good and effective work, hoth with regard to the extent of the work in a given time and to its quality with respect to an even distrihution.

Mining Notes from Soulsbyville, Cal.

EDITORS PRESS:—Mining notes in this vicinity are very scerco at the present time. The Soulshy mine is ahout tbe only one that is turning out any gold. About two weeks ago a chute of rock was struck in the south end of the mine. The vein is good eize end the rock exceedingly rich with gold and lead eulphurets. It hae not been worked out in the lower levels; there is no douht but what it continues down eeveral hundred feet. They inform me that the largest chunke of quartz that ever went into the mill were taken out lest week, and the gold goes all through the rock. The town of Soulshyville depends principally on this mine, and it is very likely to make lively timee here the coming summer.

James Burns is erecting a whim on a river near Soulshyville to run a pump hy horse-power. One of his sons discovered this mine last winter; considerahle gold can he eeen in the rock. He has a great quantity of water to contend with. Mr. B. intends to prospect it thoroughly the coming summer.

H. W. Williams is sinking a shaft on his mine at Cherokee, and he took out some very good rock last week.

Nothing has been done on the Manzanita mine for a month past. The ownere had a good prospect and intend to prospect it more thoroughly in the future.

John Yosts's mine is idle. This is no doubt a good mine. The last work was done on it ahout a year ago.

The Basin mine, which is across the Tuolumne river, is looking fine. Several San Francisco partiee have heen up examining it, hut as yet have not made the purchsse. They have six veins, three small and three principals. No. 1 is sulphurets, no free gold to speak of, hut the sulphurets are very rich, end the size of the vein is ahout three feet. The middle vein (principal) is free gold and very rich. The size of the vein is ahout two feet. The upper vein (principal) is free gold and is also very rich. The vein is two or three feet in width; all the small veins are from eight to ten inches and prospect well. This mine is in the hands of poor men, and they have no capital to put up machinery. If this mine were in the hands of men who have capital to put up mechinery, it would he valuable property.

I will recommend any one who wants to purchase a good mine to take hold of the Basin. If any one in San Francisco wants any further particulars concerning the mine, the editors of the PRESS are at liherty to give them my address. Yours respectfully, A MINER.

Soulsbyville, May 26th.

Don't Fail to Write.

Should this paper he received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if t is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

The Hill Triumph Ore-Mill.

I desirs to call the attention of mining men, and all whnm it may concern, to the following letter written to me by Mr. Wilson, of Galena, Nev., regardiug one of the Triumph ore-mills, recently put in operatiou nn his mine:

GALENA, NEV., May 8, 1885.

Mr. H. W. Rice—DEAR SIR: I think it is due you that I write you some of my impressions of Hill's Triumph ore-mill I purchased of you in March. I got it in position, and have had it running for the past two weeks. The mill is in every way more than Mr. Hill claims for it.

In quantity it will do all any one wants to do. The important part to me was, will it save the gold? My mine is quartz, oxidized iron and some clay.

It had been a question with me, will the gold amalgamate? The gold is very fine. The result in the working of the mill has been satisfactory. It saves a high percentage of the gold and mostly inside of the mill.

Below the plates and blankets we fail to find any free gold. The wheels and channels stand well so far, and show no signs of wear. The mill appears to be serviceable and durable, and no doubt Mr. Hill has struck the correct idea in his invention, and mining men should congratulate him on inventing an ore-mill to take the place of expensive stamps. I am well pleased with mine and think there will be more wanted in this camp soon.

Respectfully yours,
H. F. WILSON.

I am the manufacturer of the Hill Triumph Ore-Mills, and havo one of them in constant running order et my works, No. 56 Bluxom street.

I request mining men end thoss intercsted in mines especially to call and sse this mill, for I know it is of great velue to them.

H. W. RICE.

The Mountain Messenger, one of our best interior exchanges, end which is elways commendahly filled with local nsws, has commenced the thirty-second year of its existence, numhered consecutively from "one." Actually it is 33 years old, and this should hs the commencement of the thirty-fourth volums, its puhlication having heen commenced et Gibsonville, in the spring of 1852. But for some reason, upon its removal to La Porte the numhering was begun anew, although no change of ownership took place. Thers are hut two or three papers in the State that can show as long en existence. In all this third of a century, with the exception of a fsw weeks aftsr the fire which destroyed La Porte in 1861, there has heen no failure of its weekly issus. It has seen the rise and fall of many mining camps, and sometimes their rehahilitation. The paper is vigorous, and, puhlished as it is in a prosperous region, bids fair to have a long and usseful existence.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests epecially represented in its columns. Persons eo receiving copies are requested to examine its contents, terms of eubscription, and give it their own patronage, and, as far as practicahle, aid in circulating the journal, and making its valumore widely known to others, and extending ite influence in the cauee it faithfully eerves. Subscription rate, $3 a year. Extra copiee mailed for 10 cents, if ordered eoon enough. Personal attention will be called to this (ae well as otber notices, at times), hy turning a leaf.

TEACHER excursionists to Hawaiien Islands should provide themselves with Muller's Tourists' Glasses. Special reduction to teachers. 135 Montgomery street, neer Bush, opposite Occidental Hotel.

BY TELEPHONE.—Snbscribers, advertisers, and other patrons of this office can address orders or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

WORKS ORE WET OR DRY.

Awarded SILVER MEDALS in 1882 and 1883 By Mechanics' Institute.

MANUFACTURED AT

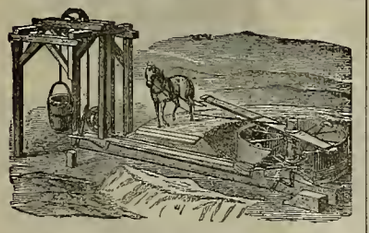
The Tustin Windmill Horse-power and Pumping Machine Works.

308 Mission Street, S. F., Cal.

By W. I. TUSTIN, Inventor and Patentee.

☞ Send for Circular. ☜

MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame-work. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

316 California St., San Francisco.

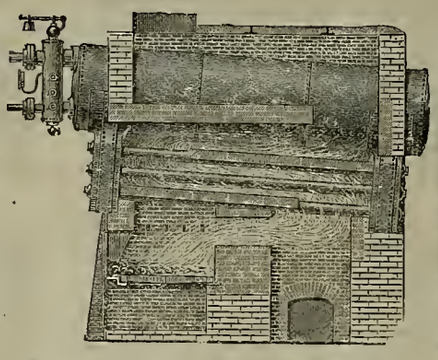
HEINE PATENT SAFETY BOILER

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

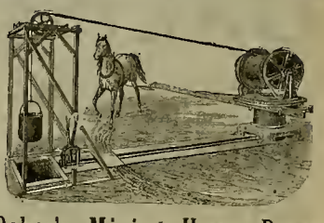
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



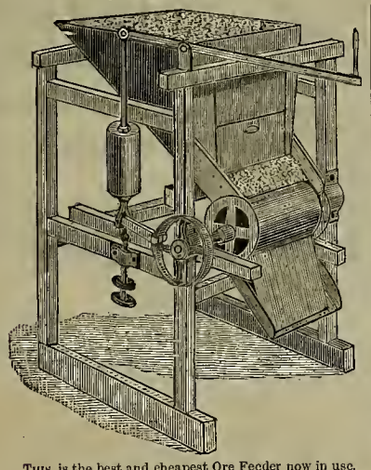
Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

HOISTING WORKS.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Shaft Sinking.

A New Method of Sinking Through Water Bearing, Loose Materials.

In the work of exploring certain gold-bearing gravels in the American valley, Plumas county, California, entrusted to the charge of Mr. James E. Mills, of Quincy, in that county, by Prof. Agassiz, of Cambridge, and Q. A. Shaw, of Boston, it became necessary to sink a shaft through loose materials containing in some layers large quantities of water. In doing this Mr. Mills was compelled to devise a new method, which has proved successful, and may be of service elsewhere. He described this method before the American Institute of Mining Engineers at the Chicago meeting, and has revised the paper for publication in the MINING AND SCIENTIFIC PRESS.

The American valley is a comparatively level tract of about 4,500 acres, surrounded with steep mountain slopes, which rise on the east, south and west to peaks of an elevation of about 3,000 feet greater than that of the valley. The flow of the valley is of loose materials—gravels, sands, clays, etc., and these rest in a rocky basin.

The lip of the basin at the lowest point of its rim where the waters leave the valley is 165 feet higher than the bottom of it, where the shaft struck the bed rock, and the surface of the loose materials at the shaft is 45 feet higher than the lip. There is, therefore, at the shaft, a thickness of 210 feet of gravel sands and clays resting in a bowl which receives water from a large area of mountain slopes. The shaft was sunk, by the method to be described, 20.7 feet further into the underlying bed-rock, making its whole depth 230.7 feet.

On geological grounds it was probable that the lower portions of the basin were filled with a mixture containing so much clay that water would pass through it slowly, and Mr. Mills tried to reach this comparatively compact material by the ordinary process of excavating and pumping out the water; but at 14 feet below the surface the inflow of water became 67 cubic feet per minute, and was fast increasing, and the material was fine and was running in under the shoe and casing down outside of the shaft. It was evidently impracticable to sink to any considerable depth through such material under the pressure existing when the water was pumped out of the shaft even if the water should not exceed the practicable limits of pumping.

[The shaft started for this purpose is shown at A, Fig. 1, of the accompanying drawings. It was rectangular and had an iron shoe Aa, which was pressed down with jack-screws as the excavation proceeded, and plank cribbing was built on as the shoe descended. Owing to the size of Fig. 1 of the engravings it is placed on page 365 instead of this page where it should properly come.]

Exploration with the drill was then made, and showed that for 60 feet the materials to be forced through were sands and gravels of a kind to run badly in places, and that below that depth, although the material as a whole was more clayey, there were at intervals strata of loose, open sands and gravels as far as the drill went, which was 170 feet. [There where geological data for concluding that its depth to bed rock was not more than 250 feet.]

The depth was too great to permit the use of compressed air to balance the pressure of the water. The Kind Chaudron process was not available, for the material would not stand unsupported for more than a few feet, in places not more than a few inches, much less for the whole depth. A cassion must be carried down with the excavation, and be kept pressed against the bottom.

Figs. 2 to 11.—TOOLS USED IN SHAFT SINKING.

The cassion adopted (B. Fig. 1, page 365 of accompanying drawings) is a cylinder of 55 inches outside diameter, of wrought iron one-half inch thick, leaving inside diameter 4½ feet. It is made of rings 4 feet long, and the rings riveted. Each ring is of one sheet, the ends of which are accurately planed and brought together edge to edge, and connected at the vertical joint thus formed by a vertical butt-strap of the same width and thickness as the horizontal one, and, like it, placed on the inside. The cassion is, therefore, a smooth cylinder on the outside, but on the inside the butt-straps project inward one-half inch. The lower edges of the horizontal straps are chamfered, the upper edges left horizontal. The vertical straps are thinned at the end to pass under the horizontal ones, so as to add to the projection of the latter not more than three-eighths inch. The rivets are three-quarters inch diameter, countersunk at both ends, and 2½ inches apart from center to center in the rows, and the two rows at each joint are same distance apart. The caulking was all done at the edges of the butt-straps. The lower part of the cylinder, which was to withstand the greatest pressure, was tested under a pressure, applied to the outside, of 150 pounds to the square inch.

The rings were put together in pairs where they were manufactured, making sections 8 feet long, so that there remained one horizontal row of rivets to be driven, and one horizontal seam to be caulked, to each eight feet in length of cassion, at the shaft.

At the lower end of the caisson is a shoe (Ba, Fig. 1) of rolled steel one inch thick, welded at the ends of the sheet to as to make a continuous ring without vertical seam. Its lower edge is not quite horizontal, but beveled so that the outer surface of the ring is one-quarter inch longer than the inner surface, making a cutting edge. It is scarfed to the ring next above, one-half of its thickness being cut away all around for a length of three and a-quarter inches, and the ring above lapping by for the same length, so as to rest on the shoulder of the scarf, and have its outside surface flush with that of the ring.

At the upper edge of the caisson there was always a butt-strap, projecting half its width. It would not do to bring to bear on this butt-strap the pressure necessary to force down the caisson; and a wrought-iron hand (Bh, Fig. 1), an inch thick and four inches wide was put there, resting on the edge of the main sheet, and surrounding the butt strap, and projecting one and one-half inches above the upper edges of the latter. The hand was in halves joined by bolts with nuts, as shown in the figure.

When the ground had been excavated and the caisson pressed down until its upper edge was 8 feet below the working floor, the hand was taken off, another section riveted on, and the hand put on top of the latter.

As the excavation proceeded, the caisson was forced down by hand with screws, reinforced toward the last by a falling weight.

The screws acted directly upon timbers 14 inches square on the end, resting on the hand above mentioned. The bottom of the timbers, which rested directly on the hand, was shod with 9 inches wide of wrought iron 1 inch thick. As the thread extended for only about 5 feet in length of the screws, blocking was put in between them and the lower timbers as the caisson went down, and removed when a new section was put on.

The screws, with their nuts and steps, are shown at C, Ca, Ch, Fig. 1, and need no further description, except that they were of strong cast-iron, called "gun-metal" in Boston,

(Continued on page 365.)

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Tuolumne Mines.

EDITORS PRESS:—I send you a short description of some of the mines located in and around the above-named place, and hope you will give it a place in the columns of your paper.

The first on my list is the famous Soulsby mine, which was discovered in the fall of 1857 by Ben Soulsby, who was placer mining at the time, and found float rock and traced it up and found the vein. He, with others, put up a 10-stamp-mill, and afterward added 10 more, and the first week's run paid for the mill and other improvements. It was worked by them till 1860. They then sold out to Donald Davidson, who afterward disposed of it to an English company. The mine has been shut down several times but was started up again. They have two hoisting works on the mine; several years ago the hoisting works on the south shaft was destroyed by fire, and was burnt down again in 1883. It was rebuilt, and is now one of the best works in the county of Tuolumne. At the present time they are taking out exceedingly rich ore, and the mine looks better than it has for several years. The rich ore is being taken out of the south end of the mine. There has been more gold taken out of the Soulsby than any other in the county; it runs up into the millions, but it is impossible for me to give the exact amount. The shaft is down 800 feet (more or less), and is now under the management of Mr. John Leechman.

The next on the list comes the Pennsylvania mine, which is the extension of the Soulsby, and owned by the same company. Some very rich ore was taken out of this mine years ago; it was idle for a great many years, and in 1884 the shaft was put down to 100 feet, and a slide came in and the vein was carried to one side, how far we cannot say; they drifted several feet, and not having any pump on the mine they shut down on account of water.

They have hoisting works on the mine and no doubt if further developed it will be as good as the Soulsby. The company will, no doubt, commence active work on it again in a short time.

Next comes the Platt mine which is a continuation of the Pennsylvania and Soulsby north shaft, 160 feet deep. The surface ground has been stoped out; it was done in early days when no one had the least idea that veins would continue down in hard rock. The shaft on the south end of the Platt is 150 feet deep, no machinery was put up on the south shaft to work the mine, and about 1866 it was closed down on account of the water coming in faster than they could keep it out with a common windlass; a good vein was left in the mine at the time it was shut down, and no work has been done since to open it.

The Raymond mine is also a continuation of the above mines. This was worked with a tunnel which was 90 feet from the surface, a chute of ore was worked out 300 or 400 feet long. A little work was done below the tunnel to about 50 feet. The last work was done by tributers; width of the vein was from 15 to 30 inches; good milling ore is now standing in the mine.

All of the above mines are the extension of the Soulsby, and that having been worked down about 800 feet there is no doubt if a little capital was spent to put up machinery and, etc., all of the mines would make good property, as only the surface ground has been stoped out and the mines were thrown idle. We have a few more mines, but little can be said about them, as not much work has been done on them. All of the above mines are south of the Soulsby. The Black Oak is no doubt good property. They have a vein in the bottom of the shaft three or four feet wide; last rock taken out paid about $1,200 a ton. Several companies has been up in the past few months, but as yet have not taken hold of it.

Live Oak is a continuation of the Black Oak. The rock taken out of this paid a very good price per ton in gold. The sulphurets are worth considerable.

Very good ore has been taken out of the Churchill, Independent and Gilson, but not much can be said about them at the present time.

It is the opinion of old miners at this place that there are millions of dollars in these mines if companies could be got to take hold of them and put out a little capital to open them up.

Soulsby & Bawden mine is to the north of the Soulsby, and it is supposed it is the extension. This mine was found in the same year as the Soulsby—1857, was not worked for some time, and it was then taken up by N. B. Dufficld and sold to a San Francisco company. After lying idle for several years it was worked by Soulsby & Bawden. They crushed rock in an arastra that paid from $60 to $70 per ton. Other parties then did some work on the mine while owned by them, and worked a short time and was shut down. In 1880 it was relocated by Westinghouse, who sold it out for a small sum, and it is now in the hands of a San Francisco company. The rock is the same in appearance as the Soulsby. All that is wanted on this mine to open it is a shaft put down 50 feet, and it would make a paying mine. A MINER.

Soulsbyville, May 25th.

California Day at the New Orleans World's Fair.

A Successful Demonstration.

California Day at the World's Fair was duly celebrated on May 7th, and we have had reports thereof from different sources. All agree that the demonstration was a success, and that great credit is due to Col. Andrews, Commissioner, and to others associated with him for the skill and zeal with which the arrangements were made.

The *Times-Democrat* gives the following outline sketch of the event: Without proceeding into the discussion of the events and features of California Day, the universal verdict may be given: Most successful. To begin with, the weather was charming; the sky just cloudy enough to hide the too direct rays of the sun. The wind was cool, and everything united to make of California Day a golden day worthy of the golden State. Long before the time announced for the commencement of the exercises the California headquarters were crowded with people, citizens of California and other States, all anxious to participate in the coming festivities. Each visitor to the headquarters was furnished with a blue badge beautifully embossed in gold, bearing the name of the State, the date of its admission to the Union, and various symbolical designs indicative of its prominence in the industrial arts. The ladies were all decorated with absolutely the most elegant badge of the Exposition year. It was composed of red, white and blue ribbons of heavy silk, and from the center of tho rosette depended a golden tassel, its connective point covered with a gold coin of Persian coinage. Of this coin a word may be said. It was not without reason that Col. Andrews chose this bit of money, for the cabalistic characters thereon guarantee good luck to the happy owner, and all ladies who were so fortunate as to obtain one should prize and wear it as a talisman against all earthly ills.

During the few moments consumed in waiting for the procession to start for the anditorium under the oaks, the assembled guests enjoyed a pleasant social reunion in the elegant and commodious headquarters of the California Commissioner. The hour so passed was a most enjoyable one, and Mrs. Andrews was indefatigable in her attempts to secure the enjoyment of the guests; an amiable occupation, he it said, in which this estimable lady has been engaged ever since her advent in New Orleans. After a few moments of waiting, in which the guests strolled through that admirable collection of the resources of California, the band arrived and the triumphal procession was formed. The band struck up an inspiriting air and the cortege moved down the long walk to the Main Building. Through the broad aisles of the great building the procession marched, and the stirring notes of the martial music and the rhythmical tread of the following cavalcade drew to the scene all the loiterers in the Main Building.

Leaving the great hall the procession marched to the auditorium under the great oaks. Here was assembled a large audience, who rose and cheered as the line of marchers, headed by Commissioner Andrews, Director General Burke and Dr. Beverly Cole, the Orator of the day, entered the reserved space.

The Ceremonies.

At about 2 o'clock the formal ceremonies of the day were opened.

On the platform sat Director-General Burke, Col. A. Andrews, Commissioner for California, Dr. Beverly Cole, Orator of the day, and others who were engaged in the ceremonies of the day; also a number of United States and State commissioners, and a host of Californians who were visiting or engaged in the Exposition.

The opening address of welcome was delivered by Col. Andrews, in which he said: "Our celebration to-day is simply for the purpose of promoting knowledge of our country and telling you all something of that wondrous land on the blue Pacific's shore, where gold and silver combine with fruits and golden grain to form that El Dorado sought in vain by the Spaniard, but discovered and developed by the ever restless and energetic American.

"Friends, I bid you welcome. Welcome to California's exhibit, and should any of you seek out our land, of which we have such pride, you will find there a welcome as hearty as that which I now extend you."

The address of Col. Andrews was received by the audience with great favor. After the applause had died away, the Commissioner introduced

Major E. A. Burke,

Director-General of the Exposition, who delivered an address, from which we quote as follows:

California and Louisiana.

In reflecting upon the relations of the State of California to this Exposition, and to its plans and purposes, it may not be inappropriate to recall to your minds the fact that this Exposition was not established to benefit any individual or any communities that were particularly interested in this locality; it was no merely for New Orleans; it was not for Louisiana; it was not even for the South alone. Its foundations and each and every one of its plans were broad and far-reaching plans, stretching out into futurity. We desire to build up the commercial prominence of New Orleans, it is true, and to advance Louisiana upon the high road of progress, and to line the South up with the progressiveness which has made our Eastern and Western States so rich and prosperous; but also we desired to show that here, upon this Southern soil, there was steadfastness of purpose, high enough and broad enough to reach out beyond mere local confines; that we could bring together the people and the exhibits of the whole country, and plant the banner that would lead forward to the accomplishment of high results in the future. [Applause.]

What part will California play in connection with the great plans and purposes of this Exposition? We know the relations it holds to our city, and to the great future we are building for it; we know of its gold and its grain, its fruits and its magnificent climate. We know of the vast stores we will draw from there, passing through our city on its way to the East and to Europe. It is no new dream—that of the vast trade and commerce that is to pass through and come from that city into New Orleans. The earliest step I made in manhood in the South was to come here with visions of the grand future of this city in connection with the extensiou of that great railroad system which has since been perfected between this city and California. I came here to take the superintendency of a section of this railroad, which had then been commenced, and which has been only recently completed. Even then we dreamed of a great, grand, broad-guage, double-track line from the Gulf to the Pacific, from New Orleans to San Francisco. [Applause.]

But aside from these points one of the plans and purposes upon which I desire to touch is that, having gathered together here in one vast array all the industries of this country, exemplifications of the thrift and the progress and the commercial development of the whole of our States and Territories, we must now press on to those unoccupied markets that America should years ago have seized upon. Upon this stand the other day I spoke of the $400,000,000 of trade that lies to the south of us in the markets of Latin-America. But across the 2,200 miles that lie between New Orleans and San Francisco and still further across the Pacific lies a great Oriental trade of $528,000,000 that belongs largely to this country, and that must come to us if we strive for it as we should. We know as regards the foreign exhibits of the Main Building that the first countries to accept the invitations of the Board of Management were China, Japan, Siam and Australasia. Why did they hasten to come to enjoy this feast? Because they knew, as we know, that the future will bring the trade of these countries, unless we continue to reject it, into the lap of America. And this grand system of railroad, stretching out from New Orleans to far-away San Francisco, why did it put forth its strength in making such magnificent contribution to the exhibit of California? They knew not only of the great interests that connected California with New Orleans as a shipping port to European countries for the products of their State, but they knew also that soon their line must become the great means of transit through the continent of the trade of the Orient. Then again, if no other sentiment impelled us, the honor the people and the Government of that State have done us by coming over 2,000 miles to our city to add the display of their grand and rich resources to our Exposition, demands our appreciation and our gratitude; and it would be a poor return, indeed, on our part, did we not both profess and feel an interest in the State sufficient to take up the question of the grand possibilities there presented to the country, and did we not acknowledge our interest and manifest our appreciation of the courtesy and honor they have done us.

Not only to the men of California and the Pacific Slope do we express our admiration and gratitude, but to the noble women of that State and of the slope, who have presented here over 2,000 specimens of the handiwork of the women of that section. And right here I desire to say that when the history of this Exposition is written, if ever it shall be written, the part that woman has played in it from its earliest institution will take a broad and dazzling prominence. She has been the aid and the inspirer of many of the very best of the features of this work; and not only by her labors, but by her pen has she accomplished this. The truth has been told and the falsehood has been exposed in thousands of instances that are never known in the general history of this Exposition. [Applause.]

After an address by Hon. L. B. McWhirter, of Tennessee, Mrs. Maria Sweazy was introduced, and read the following poem by Mrs. Florence A. Clarke, of Texas, entitled

Welcome to California.

[Written on the home bound Texas Pacific train, May 2, 1885.]

Beneath the shadows of the forest wild
Where mosses wave and water lilies lift
Their pearly chalices like holy priests
In nature's dim cathedrals, vaulted
With roofs of lapis lazuli enwrought
With emerald alt reliefs, where
Daylight melts into deep mysteries
Of twilight, in dense leafy solitudes
Where choristers unseen make balmy night
All vocal with their mellow harmonies,
Where over river, bayou, fen and pool,
The moonlight wears its mists of lucent pearl,
I call to greet thee, star of western skies,
Send back these lines, pale reflex of the thoughts
That glow within at mention of thy name.

O, California, with thy crown of snows,
Forever glistening in thy fervid sun,
Girdled with giant trees as with a zone,
Wrought by the Titans in esthetic mood;
And draped with water-falls, whose silvery spray
Flashes o'er sands of gold, whose jeweled feet
Are bathed by currents from far Asian seas,
Thou art all lovely, and thy sisters fair
Greet thee with loving pride—with open arms
Of fond affection. Art thou not our own?
Is not thy beauty ours, thy glory shared
With all Columbia's daughters? With the one
Who lately sat forlorn in weeds and woe,
With laughter hushed upon her blooming lips,
Her orange flowers and myrtles withered all,
And cypress twined about her lovely locks.

Fair Louisiana, thou hast cast aside
Thy mourning robes, and like a queen has bidden
Thy sisters from the North, the East, the West,
And thy own flowery South, to keep with thee
Thy feasts of roses, and in beauteous groups
They stand about thee, each in proud array,
And generous emulation, heart to heart,
Beloved and loving—all the past forgiven
And all the future spanned by God's own bow,
With promise of a long and prosperous peace.

Hail, California, and thrice welcome,
Land where the roses bloom in myriad homes
Like living gems; whose vines distill
Olympian nectar in their sun-kissed rows,
Whose fields of grain wave like wide golden seas,
Whose flocks and herds, like Jacob's, blessed of God
Gladden the pastures on a thousand hills,
Whose merchant ships with bales of costly silks
And ingots of pure gold dot the wide seas
With snow-white sails, like messengers of peace.

Hail, Western sister, lovely and beloved,
May He who dowered thee with royal hand
Protect thee from all harm—without from foes,
Within from unwise friends, and make the noon
Of thy full beauty perfect, as the dream
Pre-figured in thy dawning loveliness!
And may our States be close and closer knit
By iron bands and nerves of vibrant steel,
Among whose pulses flash electric thrills,
And in whose arteries beats the full, strong tide
Of life-blood from the common, central heart,
Until full grown in stately stature tall
They stand confessed before the assembled worlds,
The fairest galaxy amid the hosts
That gem the starry page of history.

So shall these daughters of the dawn fulfill
The prophecies of old, and light anew
The kindling flame of hope in world-worn hearts
Weary with watching the millenial day.
Hail, and farewell! I go to greet my own
In Texas's favored clime, yet send thee back
Imperfect greeting on the dusky wings
Of steam, the starry, swift angel
That flies o'er these wide waste fens,
Bearing glad messages of human love.
Peace be with thee. Hail and farewell.

After an enjoyable selection from tho band in attendance

Dr. Beverly Cole,

Of San Francisco, was introduced and made a most eloquent and enjoyable address, of which, unfortunately, no good report is given. It is stated, however, that the speaker concluded hy an eloquent reference to the Woman's Department of California, which in spite of the most adverse circumstances, contained no fewer than 2,000 exhibits, thanks mainly to the energy, tact and perseverance of Mrs. Lemmon, vice-president of the Pacific Slope, and the distinguished lady botanist of Califoinia.

After the Exercises.

The souvenirs given away on California Day were unique and beautiful. There were distributed 1,000 pampas plumes, 1,000 pieces of polished redwood, 20 boxes of oranges, and 1,000 miniature copies of *The Times-Democrat*.

After the completion of the exercises under the oaks a large number of guests repaired to the California headquarters, there to partake of the hospitality of the Commissioner. It was late in the evening ere the last man, loth to believe that California Day was past, departed for home.

A New Orleans paper says: One of the most delightful features of the California celebration was the concert in the Woman's Department. This space is becoming quite famous for musical entertainments, both advertised and impromptu, and music lovers feel duly grateful to Prof. and Mrs. J. G. Lemmon for the pleasure they have enjoyed at these musicales.

AN UNIQUE CARRIAGE.—A railway carriage of unique construction has been built for the South-Eastern Railway, England. The most noticeable feature of the carriage consists in its electro-plated steel paneling and electro-plated copper moldings. The electro-plating has been tried in order to avoid the expense and also the time occupied in repainting, which, owing to the numerous tunnels on the line, has proved to be a large item in the expenditure. The carriage throughout is of first class workmanship and finish, and the exterior of the body, with its bright surface of electro-plate, is said to present a remarkably handsome appearance.

WHEN the English dam on the headwater of the Middle Yuba river broke from its confines in June, 1883, the flood carried away a house and a lot of mining tools owned by the Rees Brothers, who were mining on the stream, buried their claim in debris and drowned Bradford Rees. The survivor now sues the Milton Mining Company for $25,000 for the loss of his brother's life and nearly $6,000 for damage to the property.

FISH are dying in great numbers in Sutterville lake, near Sacramento, and in other ponds. The trouble is attributed to grasshoppers, which, as food, appear to be fatal to fish, when taken in large quantities, as well as to turkeys.

MECHANICAL PROGRESS.

Must Have American Locomotives.

On the subject of American versus English machinery, Sir Julius Vogel, ex-Agent General for New Zealand, made a very interesting statement at Auckland on February 17th. Sir Julius, who is now the Colonial Treasurer, spoke for several hours on the past, present and future of New Zealand, and in the course of his speech used the following language: "We sent home an order for certain locomotives after a type which we had running in the Colony, and which were obtained from America. It was thought by the late Government unpatriotic to go to America for goods, so the plans and specifications were sent home to England, and the weights and sizes given most exactly. When these locomotives were about finished, the engineers telegraphed out that they were about to ship them, but that we had better order plant to strengthen our bridges and culverts, as it would not be safe to send the locomotives over them. Their idea was that we should make our railroads to suit their engines. We telegraphed that we should do nothing of the kind, that we had limited the weight of the engines. They replied they could not be made according to the specifications we had supplied. But the answer to that was that we had them running in the Colony, and we refused to take them. Well, this is what happened: We sent an order by telegraph to America for these engines, and such is the confidence we feel in the character of the material which will be supplied that we are prepared to take them without inspection there, while we cannot take the suspected ones from Great Britain." Sir Julius also made use of the folowing language: "I cannot help saying that under the free trade system of Great Britain there has been a great deal of scamped work and adulteration going on, and that buying in the cheapest market and supplying as cheaply as possible, manufacturers have been in the habit of not conscientiously supplying the best articles. It is only quite recently that by a happy accident—an iron axle falling to the ground and breaking while being unshipped—we were saved from sending forth death and destruction on our railways by using rotten axles sent out from Great Britain"

LEAKY BOILER TUBES.—Tube ends, according to the *Locomotive*, are a source of annoyance in some types of boilers that give rise to much trouble. This is especially apt to be the case with boilers of the vertical type. The upper ends are exposed to the action of the heated gases, and there being no water to prevent overheating, they are soon loosened and set to leaking badly. This gives rise to corrosion of the ends of the tubes and the upper head, which in many cases goes on with very great rapidity. It is no unusual thing to find the upper tube sheet of upright boilers eaten half way through and nearly all of the tubes leaking badly. This leakage is not so apparent from steam pressure as it is from water pressure. To the unpracticed boiler attendant everything may appear to be all right, but when the boiler is filled to the top with water, and pressure applied, there is generally some fun. The lower ends of tubes are also very apt to give more or less trouble, especially where upright boilers are used for heating purposes and the blow-off does not quite drain the boiler. This is generally the way uprights of the pot hung type are arranged, and during the summer months, when the boiler is standing idle, the interior of the shell and the tubes, just at the surface of the water left in the boiler, is subjected to severe pitting. Sometimes the tubes of this class of boilers are completely riddled in a very few seasons, whereas, if properly cared for, they should last many years.

THE INTERCHANGEABLE SYSTEM.—There has been some inquiry lately as to who first invented the interchangeable system of making machinery. It appears that the first use of the system was made in France in 1717, but was not a great success. In this country various efforts were made from time to time to use this system, but the details were not worked out sufficiently to make the system useful. Every one who tried it added something to the perfection of the system, but the man who probably did the most toward its perfection was Thos. Blanchard, whose inventions were used at the United States armory at Springfield. He brought out a lathe which would work accurately to any model, no matter what its form, and a little later a tool for mortising in the lock, which did its work perfectly. The first complete success under his system was achieved in 1842, when guns were made which dispensed with the old system of numbering and lettering. The interchangeable system rapidly spread to every detail of machinery manufactured.

WORKING IRON.—In discussing the question as to whether iron is improved with working, a writer on the subject thinks it can be shown that the metal can be overworked while in process of manufacture, or, at least, between much heating and much working it can be overdone—especially by the former. That the reheating of iron lessens the amount of cinder contained in it is proven by the fact that old furnace tools and grate bars, and much other old scrap iron that has been subjected to alternate heating and cooling, will, when fagoted and rolled, produce an iron of inferior quality. Iron is overworked when it ceases to work soft and easy from the liquid cinder that it should contain. Some iron possesses more cinder than others, and that which has much of it can be worked with advantage to its quality as long as the cinder holds out. To this extent, therefore, it can be improved by working, but not to the point at which a lack of cinder makes it work stiffly and dryly.

EFFECT OF MAGNETISM IN ELONGATING IRON.—The investigation of the changes brought about in the dimensions of iron and steel rods has been a tempting field for investigation to a number of scientists. Among the latest contributors to the literature of that special line of experimental work is Mr. Shelford Bidwell, who has lately announced his results in a paper read before the British Royal Society. He finds that the length of an iron rod is increased by magnetism up to a certain critical value of the magnetizing force, and if that is passed the elongation is diminished in proportion as the magnetizing force increases. The amount of the maximum elongation appears to vary inversely as the square root of the diameter of the rod. In soft steel magnetization produces elongation, and with hard steel the critical value of the magnetizing force becomes very high. In soft steel a temporary elongation once produced may be maintained by a magnetizing force too small in itself to produce any elongation. Nickel continues to retract with magnetizing forces far exceeding those which produce the maximum elongation of iron. The greatest observed retraction of nickel is more than three times the maximum observed elongation of iron, and the limit has not yet been reached.

THE LONDON INVENTORS' EXHIBITION was duly opened, according to announcement, on the 4th of May. It has met with good success both in the point of attendance and as an exhibition. It is thought the attendance will exceed 4,000,000 of persons. The American section was in a good state of forwardness at the opening. The watch department is pronounced as especially meritorious. In regard to this exhibit a late number of the English *Horological Journal* has the following: "While the Americans are preparing a large and complete display of watches and machine tools at the Inventions Exhibition, English manufacturers are, with few exceptions, obviously letting the opportunity slip. The poor show of English watchmaking may be partly accounted for by the fact that while the Americans appeal directly to the public, the industry here is conducted on different lines. Some of the largest manufacturers, who would otherwise have exhibited, abstain in deference to the prejudices of shopkeepers whom they supply, and smaller producers, who require to turn over their stock frequently, cannot afford to lock up a large capital for six months. Others fail to see a fair prospect of return for their outlay."

PHOSPHOR INGOT IRON OR STEEL which is claimed to be practically free from silicon and low in carbon, has been patented by J. P. Witherow and H. W. Oliver, Jr., of Pittsburgh, Pa. In producing the iron the inventors employ a stationary converter, and charge it with, say, 3,400 pounds of metal containing 1.8 per cent of silicon and .55 of phosphorus. The charge is blown with a low-pressure blast, beginning at seven pounds and then slowly reduced to five pounds. In five or six minutes the cinder will begin to flow from the cinder notch, and this flow continues from one to two minutes. The blow is continued, and then the metal is tapped off in a ladle and recarburized, if desired, by the addition of ferromanganese in the usual way. In this operation the charge is said to be practically desiliconized, while the phosphorous remains in the metal.

TO SHARPEN GLASS CUTTERS.—The following is a simple and easy method of re-sharpening this handy household tool: When the cutter gets dulled so that it will not cut, get a strip of soft metal—soft solder is best. Lead will do; but is rather soft. Zinc is rather hard. Run a groove, with the cutter, in the metal about five or six inches long; make up a little emery powder, not too coarse, with water; put the emery and water in the groove. Run the cutter backward and forward in the groove, putting on fresh emery if required. In about a minute your cutter will be sharpened. Wash out the emery from the cutter under the tap, dry, and put a little oil on it, and your cutter will cut as fresh as ever.

PROGRESS IN CANNON MANUFACTURE.—Scarcely 25 year ago the most powerful piece of artillery was a 68-pounder, throwing its projectile with a velocity of 1,600 feet per second. Now the weights of guns have been increased from 5 to 100 tons, the velocities from 1,600 to 20,000 feet per second, the energies from 1,000 foot-tons to over 52,600, and the projectiles from 68 pounds to 2,000 pounds.

TO WELD CAST-STEEL.—Take rock saltpeter, one-quarter pound, dissolve in one-quarter pound oil of vitriol, and add it to one gallon of water. After scraping the steel, get it hot and quench in the liquid, and then heat, and it will weld like iron. Better than horax.

SCIENTIFIC PROGRESS.

Sea Telegrams.

The desirability of securing telegraphic communications with floating vessels moored at sea on dangerous parts of the coast has long been under the consideration of the British light-house authorities, but the difficulties opposing a successful solution of the problem proved so great that little, if anything, was done until within a short time ago.

The great difficulty has been to secure the telegraphic connection on board the ship, as the light vessels are moored at the bow by a chain cable 1½ inches in diameter; this chain in bad weather is payed out sufficiently to allow them to ride and swing freely. Sometimes the motion is so great that the vessels describe repeated circles. Any wire connection of an ordinary character would become so inextricable as to be totally useless. The connection would also require to be payed out whenever the mooring chains were payed out. Fouling with the ship's anchors was also another difficulty to be overcome.

The problem, according to an English paper, was ultimately placed in the hands of the British Telegraph Construction and Maintenance Company, and a contract was entered into whereby they were to electrically connect a light vessel with the shore and maintain such communication for one year, no payment being made in the event of any failure to comply with such condition, unless the failure should arise during the working of the cable from exceptional causes for which the contractors could not fairly be held responsible.

The company, after a variety of experiments, have adopted a hollow steel wire rope, 8½ inches in circumference, formed by 14 twisted strands, to be used as a substitute for the chain mooring. The cable runs through the center of this wire rope. On board the light-ship a Morse transmitter, a Wheatstone A B C and a telephone have been fixed. The light-vessel is moored in 10 fathoms at low water, and is about nine miles off the shore. The importance of establishing direct communication with the light-ships cannot be too highly valued, as they frequently see ships in danger several hours before the fact has been known on land.

No doubt if this experimental departure in a new direction be successful, all other light ships round the coast will be electrically connected with the shore, and there seems no reason why all lighthouses should not also be in telegraphic communication with the main wires of the country.

Auroras.

Various speculations are met with from time to time as to the extent of any individual display of an aurora. A prominent French writer has recently attempted to show that auroras are not widely extended, and has instanced the case of the most brilliant aurora of modern times at Brussels, Belgium. This phenomenon occurred on Feb. 4, 1872, and the writer emphasizes the fact that it was not seen at Godthaab, Greenland. Meteorological observations at the latter place for this date are not accessible, but there is little doubt that, if there were such, it would be found that the sky was clouded, thus preventing the appearance. At all events, the observations made on the American polar steamer *Polaris*, which wintered about 400 miles north of Godthaab, show the most brilliant aurora of the winter on Feb. 4th. The same aurora was seen throughout the northern United States.

When we consider that, as shown by Professor Loomis, during a maximum period of sun-spots there are also the greatest number of auroras, and that great solar outbursts are followed or accompanied by magnetic storms and brilliant auroral phenomena, we are led to the view that the cause of the latter may be super-terrestrial, acting either directly or indirectly through induced earth-currents.

It would seem as though all auroras are a manifestation of cosmic energy, and that their extent and brilliancy are limited by the amount of energy, by the vapor in the air, by the temperature, etc. Professor Lemstrom, in Finlaud, obtained a simulation of the aurora by artificial means during one winter; but during the next winter, which was barren of brilliant auroras, both he and Professor Tromholt, the latter in Iceland, failed in this. It may be that the first success was owing as much to earth-currents, or a condensation of atmospheric electricity, as to the artificial means employed.

The question of the source of the electricity of an aurora is an important one in meteorology; and the fact that thus far all attempts at connecting auroral phenomena directly with meteorological have failed, goes far to show a cosmic rather than a terrestrial origin for the aurora.—*Science.*

A PRIZE AWARDED.—The prize offered by the *Societe d'encouragement pour l'industrie nationale*, of £40 for the discovery of "a new alloy useful in the arts," has been awarded to P. Manhes, on account of his discovery of the value of an alloy of copper and manganese for improving the quality of commercial copper. Manhes prepares an alloy of 75 per cent copper, and 25 per cent manganese, and adds it in small quantities to the molten copper after refining and just before casting, stirring the bath of metal at the same time. The manganese of the alloy is stated to immediately combine with the oxygen of the dissolved cuprous oxide, forming a manganiferous slag which is easily removed. The operation is cheap, and very much improves the quality of the copper so treated. Also several of the principal alloys of copper, bronze, gun metal, brass, are of superior quality when prepared with copper purified in this manner, and copper so treated is more slowly acted upon by sea-water.

THE BARTHOLDI STATUE.—At this present writing the Bartholdi statue is daily expected at New York. Some change has been made in the manner of lighting it, which it is thought will add largely to the effect. Instead of having lights streaming from the diadem of the figure, as was at first intended, it is now proposed to have electric lights placed, with strong reflectors, around the foot of the statue, casting a very strong light upon it, and thus giving it the appearance during the night of a shining statue. Then a great vertical beam of light will spring from this uplifted torch, whose light, it is calculated, will strike the lower stratum of clouds, when any are over it, enabling the reflection upon them to be seen far out at sea.

ARTIFICIAL GRAPHITE.—Dr. Aaron has exhibited at the meeting of the Berlin Electrical Society various specimens of vegetable carbon, which made conductors, and rendered almost incombustible by energetic and prolonged heating in a vacuum or in a neutral atmosphere. These properties are so much like those of graphite that the product may well be called artificial graphite, although it is not crystalline. The experiments show that if, as has been affirmed, the presence of hydrogen in graphite determines its combustibility, this can be true only of combined hydrogen, for carbon which has been calcined and made incandescent in an atmosphere of hydrogen is no more combustible than before.

NERVOUS SYSTEM OF SPONGES.—Dr. R. Von Lendenfeld has been studying the sponges of the Australian shores for the Linnean Society of New South Wales, has succeeded in discovering the nervous system of these low animals, which has hitherto escaped observation. This discovery is of very great scientific interest, inasmuch as it proves the much disputed animal nature of sponges beyond all doubt. The nervous system consists of small moidermal, spindle-shaped cells, similar to those ectodermal elements which perform the functions of sensitive cells in jellyfish and other higher animals. Ganglia cells have also been detected similar to those in higher animals.

PEACE OR WAR.—There are those who have, no doubt at least, an unspoken desire to see the two great nations which have stood at swords points so long, actually engage in a bloody conflict that gain might thereby come to some one. But the fact should be recognized that it is an immutable law of nature that no man shall benefit by the calamities of another man; and the law is as applicable to nations and communities as to individuals. The highest interests of civilization and progress, moral and material, are all identified with the maintenance of peace and good-will among the nations.

A CURIOUS FACT.—It is a curious fact connected with deep mining that from the hours of 12 at night till 3 in the morning, the disturbing influences in the bowels of the earth obtain increased activity. At this time it is observed by miners that water falls from places where none is observable during the day. The volume in the water-wheel is perceptibly increased, the atmosphere is charged with gases, which often prevent the lights from burning, and small particles of earth and rock are observed to fall from the tops of the drivers.

A NEW FORM OF ELECTRIC WIRE.—A firm in Glasgow, Scotland, is now manufacturing ribbon wire for electric purposes. It is nearly rectangular in section, and thus can be wound into a smaller space than round wire, while its greater flexibility renders it far more easy to manipulate. It is marked with the same numbers as the corresponding sizes of round wire, and is delivered on wooden bobbins.

THE HEALING POWER OF EARTHQUAKES.—The healing power of earthquakes is a subject for discussion in the Spanish medical press. The statement is made that in the recent shake-up at Malaga most of the patients forgot their diseases and took to the open air. The change agreed with them so well that only a few returned to the hospital.

A PREHISTORIC WORKSHOP.—A French archæologist, M. Saillard, has discovered the workshop of a prehistoric armorer in a steep rock on the coast of Britany. The workman lived in a stone age, and his skeleton was found among the various stone weapons and implements upon which he had been working.

GALLIUM has, for the first time, been isolated, says the Chemiker Zeitung, by an industrial procedure by Dr. L. Ehrlig. The melting point of gallium is 30.5 degrees C., and the globules in which it was obtained had a luster greater than that of mercury.

TABLE OF CONTENTS.

EDITORIALS.—Shaft Sinking, 361. Passing Events; Shasta Mines; Entering Vitiated Mines; Mining Reservoirs and Ditches in California; Local Notes; Potassium Bichromate, 364. A California Steel Steamship, 365.

ILUSTRATIONS.—Fig. 2—Tools used in Shaft Sinking, 360. Fig. 1—Mills' Method of Shaft Sinking Through Water-bearing Loose Material, 365.

CORRESPONDENCE.—Tuolumne Mines, 362.

MECHANICAL PROGRESS.—Must Have American Locomotives; Leaky Boiler Tubes; The Interchangeable System; Working Iron; Effect of Magnetism in Elongating Iron; The London Inventors' Exhibition; Phosphor Ingot Iron or Steel; To Sharpen Glass Cutters; Progress in Cannon Manufacture; To Weld Cast Steel 363.

SCIENTIFIC PROGRESS.—Sea Telegrams; Auroras; A Prize Awarded; The Bartholdi Statue; Artificial Graphite; Nervous System of Spong s; Peace or War; A Curious Fact; A New Form of Electric Wire; The Healing Power of Earthquakes; A Prehistoric Workshop; Gallium, 363.

ENGINEERING NOTES.—The Cost of the Distribution of Power by Electricity; Progress of the Tehauntepec Ship Canal Railway; A New Ship Canal Scheme; Safe Loads on Iron Columns; Telegraphic Communication at Sea; An Extensive Irrigation Enterprise, 367.

USEFUL INFORMATION.—How to Split a Bank Note; Browning Green Barrels; Origin of Carriages; Stain-Removing Soap; A New Metal-Drilling Tool; Glue; A New Preparation on Wood; Staining Wood to Resemble Cedar; The First Clock; Canned Eggs; Paper Plates, 367.

GOOD HEALTH.—The Management of Scarlet Fever; Healing Properties of Water; Tickled to Death; The Alcoholic Disease; A Peculiar Development, 367.

MISCELLANEOUS.—California Day at the New Orleans World's Fair, 362. Reductions Works Needed in Nevada; A Group of Moths; Idle Mines and Idle Capital; The New Smelting Works at Eureka, 366.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 368-69.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notiees of Meetings, Assessments, Dividends and Bullion Shipments, 372.

Business Announcements.

Passing Events.

There is little news of an exciting nature from the mining regions, everything going on about as usual at this season. Work is being prosecuted vigorously at most of the camps.

There is a tendency apparent to extend the leasing system. The miuers who are working under this plan seem to prefer it to working for wages, and it has of late come into vogue in many camps on the coast.

Prospectors are now out in all directions in the mountains busily engaged in their summer's work. There are more men prospecting in this State this year than has been the case for a long time. Gold mines are looking up, which is one of the reasons for this.

The Indians are causing trouble again in Arizona and the military powers are once more called upon to take charge of the Indiaus, after the Indian Bureau has brought about trouble.

The immense funeral of Victor Hugo in Paris this week, where over a milliou persons were in attendance, is an evidence of the esteem in which this brilliant poet, novelist and patriot was held by the people among whom he lived. It shows too that a man in Europe may rise to a position above that of kings. No monarch ever had such a funeral or occasioned such general regret at his death.

Shasta Mines.

We give in another column the first of a series of letters from our traveling representative, Frank W. Smith, from the northern counties of this State. The proper mention of the districts of Shasta county cannot he made in one or two issues of the PRESS, hence this is hut one of the series of the letters on the mineral resources of Shasta county, and the other northern counties will also receive due attention.

The newcomer to Shasta learns first of the virtues of the mining camps and districts along the line of the Oregon division of the Central Pacific Railroad about and above the thriving town of Redding, 236 miles distance from San Francisco. This town is the metropolis of Shasta county, and is so situated as to supply a large agricultural as well as a big mining district with the luxuries and necessities of the surrouudiugs. Adjacent to the line of the railroad and the serpentine windings of the crystal waters of the Sacramento (the stream isn't colored up there) is a large number of mining districts, most of which are tributary to Redding. As a natural consequence the new arrival—unless he be a subscriher to the MINING AND SCIENTIFIC PRESS—learns only of these districts to start on.

It has only beeu within the past year that capital and mining men have taken the trouole to iuvestigate the claims of Shasta, and the investments in her mines and the output realized hy these iuvestments speak in glowing and forcible terms of her richness in mineral. It seems strange that mining men should have overlooked this rich field so long and sought inaccessihle and remote places nroverhial for their lack of advantages and in most instances a laok of mineral in paying quautities. Our representative fiuds Shasta county's greatest drawhack, at present, to hecoming a great producing county to he her many advantages in climate, supplies and mineral. Prospectors, of course, find and locate the mines. As a rule, locations are made for what they are worth, and the prospector tries to sell it for what *he thinks* it's worth. The natural advantages enahle the prospector to live so cheap, and he has so many surrouudings of great value to a mine to hoast of that he is so exorhitant in his price that capital is compelled to await the cooling of his imagination and a reduction of his figures to a husiness basis. Mr. Smith saye that capital is gaining a foothold in the county, slowly hut surely, and the extensive development of mines in nearly every district shows mining men of means are alive to the mineral wealth of the county.

Entering Vitiated Mines.

It is etrange that so little is done to secure the safety of men who venture into the atmosphere of an exploded, or otherwise vitiated mine, to secure comrades from imminent danger, or to recover the bodies of the dead. The fault seems rather to lie with the men themselves who undertake these hazardous duties than with inventore. Every now and then we hear of trials of apparatus for enahling the wearer to hreathe freely and with safety in an irrespirahle atmosphere; and in most cases the results are described as successful and satisfactory. The highly scientific invention of Mr. Fleuss appears to he singularly well adapted for the purpose. But though the experiments are successful we very rarely hear of the apparatus in actual use. The reason is probahly that it is not on the spot when it is most needed. Unless large mince are provided with such an apparatus they cannot he ready to afford assistance when needed. It will hardly he contended that the need for such means of security is small. How often are the lives of brave men sacrificed in the attempts to penetrate into the center of an exploded coal mine. No doubt the courage of the man who voluntarily exposes himself to these risks is of the highest order, and even if he lacks prudence, his employers ought to do their share hy having apparatus to prevent danger. If a suitable apparatus were at hand whereby the hreathing was sufficiently provided for, they could at once advance to the points where their attention or aid is required. As it is, conjecture has to supply the place of knowledge. Truly there is yet hut little science in the miue. There is little practical utility in apparatus having tuhing connected to a distant source of air. The explorer must be free of each impediments and risks. A necessary part, or accompaniment, of any hreathing apparatus must he a portahle electric lamp. But this, in the present state of electrical knowledge, is a provision easily made.

Mining Reservoirs and Ditches in California.

The cost of huilding the immense storage reservoirs for collecting water for hydraulic mining in this State was very great, and most of these reservoirs are now useless, owing to the stoppage of hydraulic mining. Aside from the cost of construction, the cost of maintaining the ditches and canals is an important item. It embraces the cost of supervision, repairs, watchmen, etc. It costs the Milton $40,000 and the Bloomfield $30,000 a year to keep their ditches in effective condition. The cost of the Milton is 6.10 cents per inch; on the Bloomfield, 2.27 cents per inch. These ditches cost originally $7,000 to $10,000 per mile. The various reservoirs supplying these mines during the dry season have an impounding capacity of about 5,000,000,000 cubic feet of water. They are situated at elevations of from 5,000 to 7,000 feet above sea level. These two mines employed 400 white miners, at $2.50 to $3 per day, and dishursed yearly in the immediate neighborhood of the mines over $300,000.

The ditches of the Milton Company, 84 miles long, cost $462,698; its reservoirs $214,000. The whole property cost $2,000,000. The North Bloomfield property has cost $2,500,000, of which its reservoirs cost $246,707, and its ditches $466,768.

Mr. W. A. Skidmore, secretary of the Miners' Association, has compiled a table which shows the storage capacity of the miuing reservoirs of this State to be approximately as follows:

	cubic feet
North Bloomfield Co.'s reservoirs hold	1,050,000,000
Milton (now broken)	650,000,000
Eureka Lake and Yuba Canal Co.'s (consolidated)	1,130,000,000
South Yuba Water Co.	1,800,000,000
Omega and Blue Tent M. Co.	300,000,000
Spring Valley G. M. Co.	300,000,000
California Water Co.	600,000,000
El Dorado Co.	1,070,000,000
Small reservoirs on Feather, Yuba and Bear rivers	700,000,000
Estimates of reservoirs in Amador and Calaveras counties	400,000,000
Total	8,000,000,000

According to the official reports of the Surveyor-General of California there are in the State 575 mining ditches, aggregating 4,992 miles in length. This would include many branch ditches of the large companies, which are not embraced in the followiug tahle compiled from the State Mineralogist's report, which is suhmitted with some alteration and correction by Mr. W. A. Skidmore:

Name.	County.	Character.	Length. Miles.	Capacity. Miner's inch.	Cost.
Auburn and Bear River Canal	Placer	Mining and Irrigating	75	3,000	$360,000
Amador Canal Company	Amador	do.	65	2,000	420,000
Blue Tent	Nevada	Mining	32	2,000	180,000
Blanket City	Sierra	do.	17	2,000	90,000
Cherokee and Spring Valley	Butte	do.	50	2,000	125,000
Chapman's Ditch Flat	Placer	do.	50	2,000	125,000
California Water Company	El Dorado	Mining and Irrigating	125	4,500	560,000
Barhanelles Company	Placer	do.	177	3,000	125,000
Eureka Lake and Yuba Canal	Nevada	do.	163	5,800	728,313
Excelsior, Smartsville	Yuba	Mining and Irrigating	110	3,000	1,000,000
El Dorado Canal	El Dorado	do.	26	5,000	650,000
Gold Run Ditch	Placer	do.	26	4,500	150,000
Iowa Hill Company	Placer	do.	27	4,500	175,000
Hendricks Company	Butte	Mining and Irrigating	45	2,000	163,150
Little York and Liberty Hill	Placer	do.	35	3,500	130,000
Milton Company	Calaveras	Mining and Irrigating	100	3,000	500,000
Nokelumne Hill and Campo Seco	Nevada	do.	35	3,200	160,000
North Bloomfield Company	Nevada	Mining and Irrigating	16	3,500	3,500,000
Phœnix Ditch Company	Sacramento	do.	100	4,000	1,000,000
Power's Ditch	Butte	do.	30	2,000	850,000
South Yuba Canal	Nevada & Placer	Mining	123	7,000	800,000
Tuolumne Water Company	Tuolumne	do.	75	3,000	1,500,000
Union Water Company	Sierra	do.	50	1,500	350,000

WEAVERVILLE has built a splendid trail to the New River mines, has it paid for and a cash balauce on hand.

Local Notes.

BIDS for the construction of a new boiler for the steamer *Manzanita* were opened this week by Lighthouse Inspector Phillips and were found to he as follows: Mare Island Navy Yard, $15,370.95; Fulton Iron Works, $8,900; Keystone Boiler Works, $14,000; Union Iron Works, $13.770; Moynihan & Aitken, $7,400; Risdon Iron Works, $12,700. The hids will he forwarded to Washington to be awarded hy the Lighthouse Board.

A FORCE of men is extending the Spear street car track, from the present terminus at Hathaway's wharf to the Oregon dock. In course of time it will he further extended along the water front to the Pacific Mail dock.

THERE are in the vaults of the Mint and Sub-Treasury in this city a surplus of 61,000,000 standard dollars. The supply has for sometime exceeded the demand. The Director of the Mint in Washington decided to reduce the monthly product in San Francisco from 500,000 to 100,000. In consequence of this reduction, and not for political reasons, 41 employes have been discharged.

THE Union Iron Works, having the contract for raising the capsized and sunken ship "Earl of Dalhousie," will soon have her up. They have closed up all orifices and pumped air into the hold. She was lifted 10 feet, and it was found that her anchors aud chains kept the how dowu. A scow was taken over the how, pumped full of water, and then pumped out, so that in lifting it would take, by means of chaius passed under the vessel's how, the weight of the forward part of the vessel. When the ship partly floats she will be towed on to the mud flats near the works and there righted.

THE explosion of the hoiling vats at the tripe factory, South San Francisco, last week, killed one man and seriously wounded several others. A committee from the Stationary Engineers' Association visited the scene of the accident, and it was fouud that the vat whioh exploded was 11 feet long and 72 inches in diameter, while the plate was originally hut one-quarter of an inch in thickness. Thie, owing to long use, had been worn away, until at one spot where it was measured it had a thickness of but one-sixteenth of an inch. There was no steam-gauge or safety-valve connected with the receiver which conveyed the steam from the vat, and it was possible, and highly prohahle, that the vat at the time of the accident held the same amount of steam as did the hoiler—150 pounds. There heing no way to measure the steam in the vat it was left to the man at the hoiler to guess at the quantity it contained. The committee is of the opinion that the vat which exploded and those still in usc at the factory are unsafe with 60 pounds of eteam; that the receivere connected with them should he provided with gauges and safety-valves, and that the best precaution against the repetition of the accident would be the immediate employment of a man underetanding his husiness to take charge of hoiler and vats.

Potassium Bichromate.

This important chemical salt, owing to the discovery of extensive chrome-iron deposits in Maryland, was one of the first manufactured in this country. From this source the greater part of the chrome ores were obtained for domestic manufacture until the discovery of ore in California, where since 1869 many deposits have heen discovered and worked. Ore occure also in the Sierra Nevada range, hut transportation costs too much to admit of its utilization. Orc has been shipped from San Luis Ohispo, Placer and Del Norte counties. It also occure in Napa and Sonoma counties. We produce here about 3,000 tons a year, which is shipped to Baltimore.

The gencral results of over 100 analysee of ore found in this State may he given as follows:

	Per Cent of Chromic Oxide.
Del Norte County	39 to 45
Napa	42 to 46
Placer	35 to 55
Tuolumne	44 to 45.
San Luis Obispo	38 to 60
El Dorado	20

The production of bichromate in the United States during the census year (1880) was 4,000,000 pounds, valued at $520,000. The uses of potassium hichromate are various, but are mainly in the manufacture of chrome pigments printing, dyeiug, charging electric batteries and in tauning leather.

Shaft Sinking.

(*Continued from page 361.*)

where they were made, and there were anti-friction buttons of hard steel in the steps. They were six in number, arranged as shown in Fig. 1, in two sets of three each; but for the greatest part of the time only four were used, in two sets of two each. The nuts of each set were fixed into a timber 14 inches square on the end (D, Fig. 1), and this was held down against the thrust of the screws by four rods (E, Fig. 1) of round iron, one and a half inches in diameter, which passed through it and a similar timber (F, Fig. 1) placed under the main shaft head timbers; the rods having nuts at both ends, and cast-iron washers a foot square, between the nuts and the surface of the timbers. The shaft-head timbers bore the weight of the hoisting frame, and part of the building, and a load of gravel and clay, which was increased from time to time, as became necessary.

One or more hydraulic presses, given by the engine, would do the work much better, and at much less expense than these screws. The pressure could then be kept even and constant while the excavation was going on.

The excavating was almost wholly done by a drill-pump itself loosened the ground, broke up the boulders when too large to pass through the valve, and raised the material efficiently.

The auger stem (H, Fig. 1 and Fig. 5), jars (I, Fig. 1 and Fig. 6), sinker-bar (J, Fig. 1 and Fig. 7), rope-socket (K, Fig. 1 and Fig. 8), temper-screw and clamp (L, Fig. 1 and Fig. 9), and wrenches (Fig. 11) were the same as are used in the oil regions of Pennsylvania, where the tools were made, except the auger, stem and sinker-bar were made shorter, and the necessary weight was secured by increased diameter, because the distance between the sheave (M, Fig. 1) was too short for tools of ordinary length.

The drill-pump could not have a diameter near that of the shaft, like the sand-pumps of artesian wells, nor could it extend (like the drills used in artesian well-boring, and in the Kind-Chaudron process) across the shaft, so as to be brought to bear on the whole area of the bottom by being turned around. It was therefore hung from a movable point, so that its position could be shifted, and it could be placed over and dropped on to any part of the bottom of the shaft. This could hardly be accomplished with the walking-beam ordinarily in use in artesian well-boring; and the drill-rope, therefore, instead of being suspended from such a beam, was connected through the clamp and temper-screw with another rope (N, Fig. 1), which was attached by a loose wooden eye (O, Fig 1) to the wrist-pin of the gear-wheel through which the drilling motion was imparted to the tools. Such a connecting rope is in common use in sinking small artesian wells by horse-power, but it passes over a sheave fixed in position.

[*To be concluded.*]

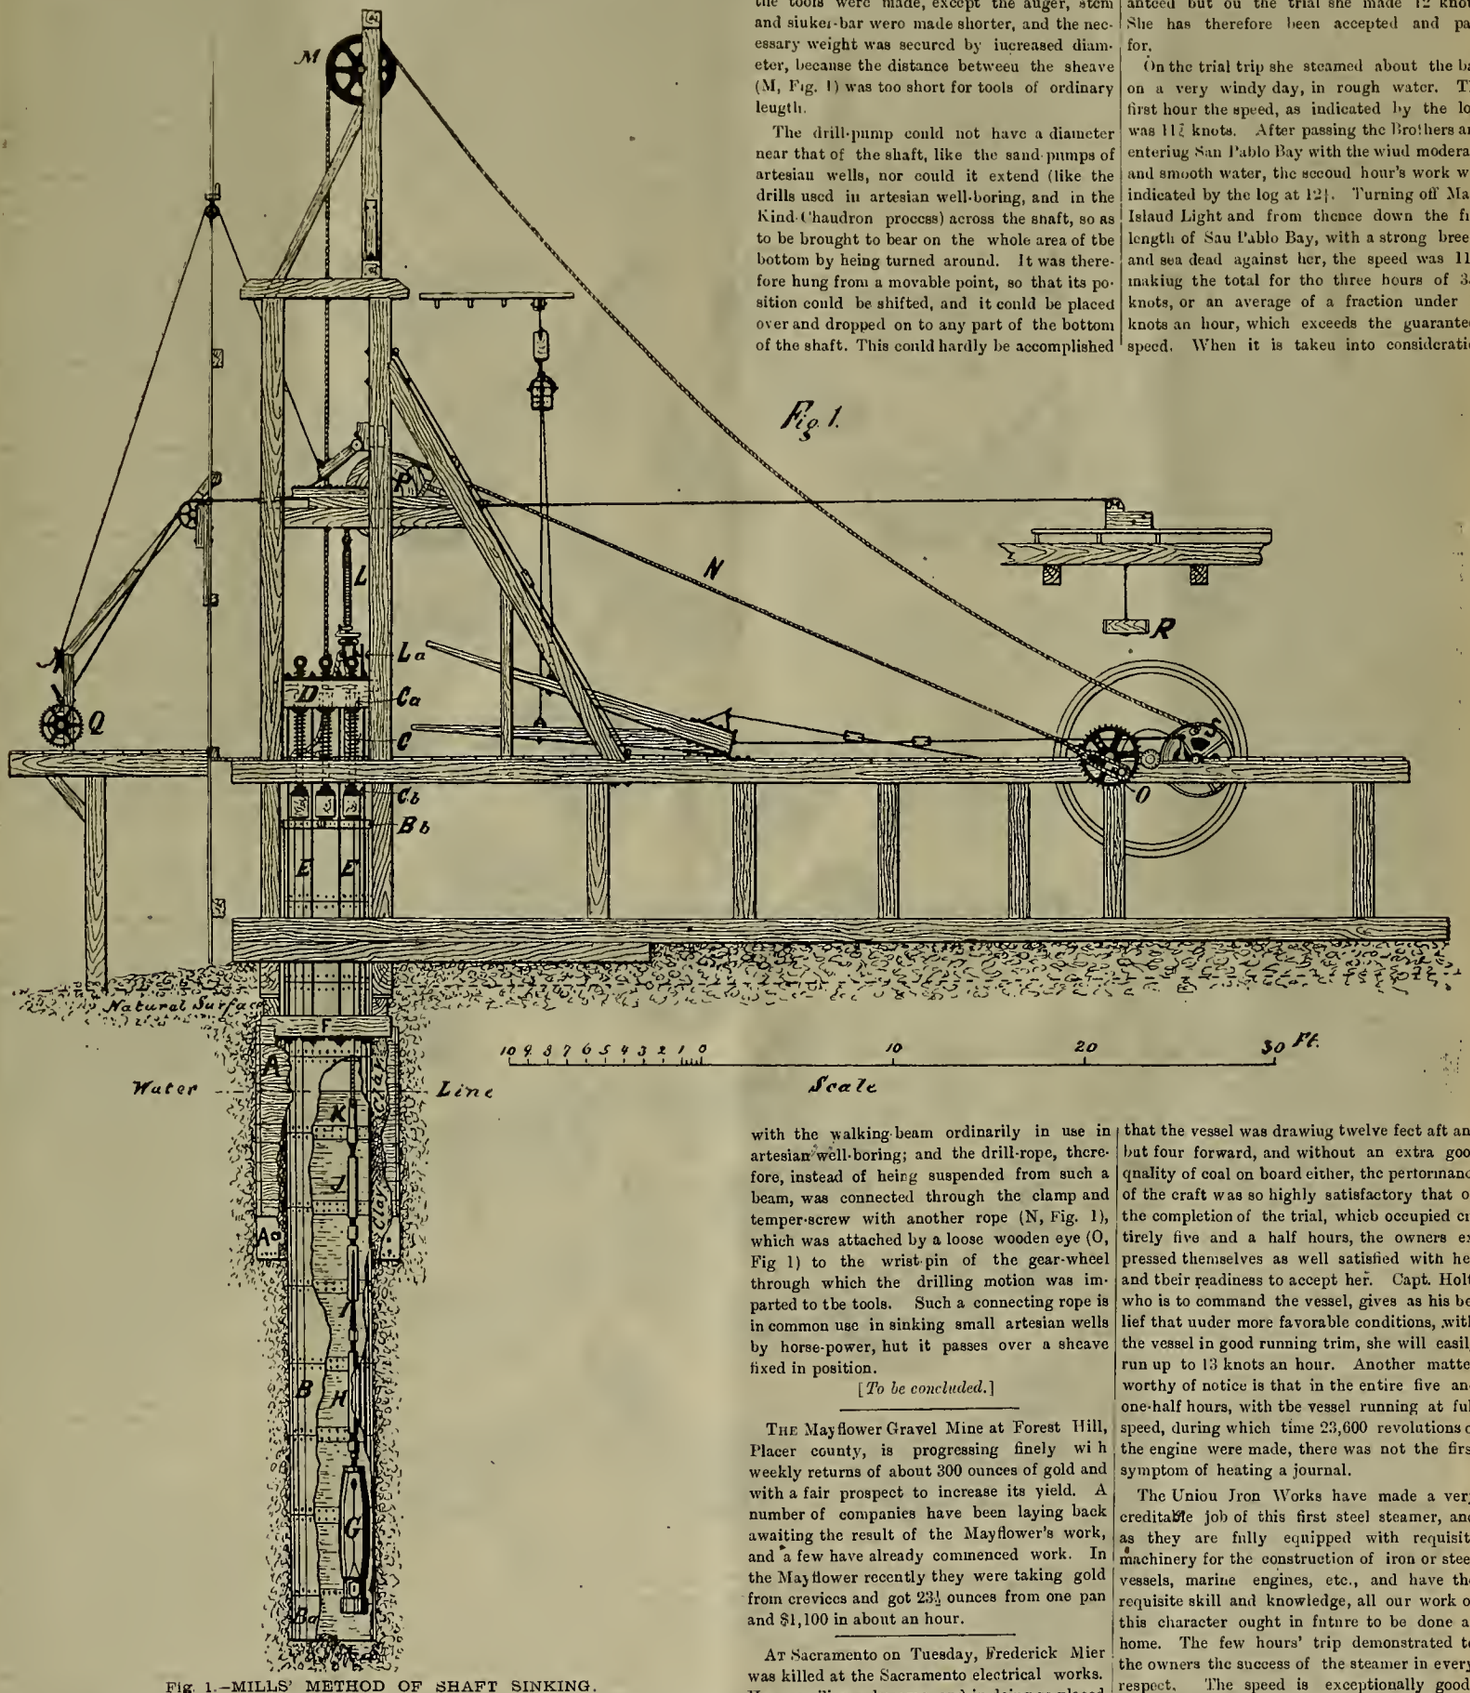

Fig. 1.—MILLS' METHOD OF SHAFT SINKING.

modification of the sand-pump used in sinking artesian wells, which I will call the drill-pump.

It is shown at G, Fig. 1, and in Figs. 2, 3, 4. It it essentially a cylinder or barrel, with an annular drill at its lower edge, and a valve seated just above. It will be more fully described below. The flat drill shown in Fig. 10, was made to be used in ground too hard for the drill pump, and to break up large boulders, and was tried for these purposes a few times, but to little or no perceptible advantage. The

THE Mayflower Gravel Mine at Forest Hill, Placer county, is progressing finely with weekly returns of about 300 ounces of gold and with a fair prospect to increase its yield. A number of companies have been laying back awaiting the result of the Mayflower's work, and a few have already commenced work. In the Mayflower recently they were taking gold from crevices and got 23½ ounces from one pan and $1,100 in about an hour.

AT Sacramento on Tuesday, Frederick Mier was killed at the Sacramento electrical works. He was oiling a dynamo, and in doing so placed his right foot upon a bolt that went into the concrete floor. When the oil can struck the dynamo it formed a connection which gave him such a shock that he was instantly killed.

JAMES R. HARDENBERGH, formerly Surveyor-General of this State, died at Oakland on the 30th ult. He has been statistician in the mint in this city for some time, and has been collecting material for the report of the Director on the subject of the mining interests of California.

A California Steel Steamship.

A short time since we gave a description of the launch of the first steel vessel ever built on the Pacific Coast, which was constructed by the Union Iron Works at their new shipyard at Potrero. The steamer, the Arago, has been completed and her trial trip was made on Saturday. A speed of 10 knots was guaranteed but on the trial she made 12 knots. She has therefore been accepted and paid for.

On the trial trip she steamed about the bay on a very windy day, in rough water. The first hour the speed, as indicated by the log, was 11¾ knots. After passing the Brothers and entering San Pablo Bay with the wind moderate and smooth water, the second hour's work was indicated by the log at 12½. Turning off Mare Island Light and from thence down the full length of San Pablo Bay, with a strong breeze and sea dead against her, the speed was 11¾, making the total for the three hours of 35¾ knots, or an average of a fraction under 12 knots an hour, which exceeds the guaranteed speed. When it is taken into consideration that the vessel was drawing twelve feet aft and but four forward, and without an extra good quality of coal on board either, the performance of the craft was so highly satisfactory that on the completion of the trial, which occupied entirely five and a half hours, the owners expressed themselves as well satisfied with her and their readiness to accept her. Capt. Holt, who is to command the vessel, gives as his belief that under more favorable conditions, with the vessel in good running trim, she will easily run up to 13 knots an hour. Another matter worthy of notice is that in the entire five and one-half hours, with the vessel running at full speed, during which time 23,600 revolutions of the engine were made, there was not the first symptom of heating a journal.

The Union Iron Works have made a very creditable job of this first steel steamer, and as they are fully equipped with requisite machinery for the construction of iron or steel vessels, marine engines, etc., and have the requisite skill and knowledge, all our work of this character ought in future to be done at home. The few hours' trip demonstrated to the owners the success of the steamer in every respect. The speed is exceptionally good, when it is considered that the vessel is built for a coal carrier.

The Arago is 207 feet long over all, 200 feet water-line, 30 feet beam, 16 feet hold, and of 750 tons register. The engines are direct-acting inverted cylinder surface-condensers, with cylinders respectively 24 and 48 inches, 38-inch stroke. The propeller is 10 feet in diameter. The boiler is 16 feet long, 8 feet 6 inches wide, 15 feet high, and designed for 100 pounds pressure.

Reduction Works Needed in Nevada.

What is needed in various sections of Nevada, says the Eureka *Sentinel*, in order to foster and build up the mining industry, is reduction works. The cry goes up from miners of limited means all over the State that while they have ore which would work $20, $40 and even $80 a ton they have no means whereby to get it reduced nor are they able to dispose of it, unless they ship it at great trouble and expense to some point probably 200 or 300 miles distant. In as much as we have here in Eureka two of the best furnaces on the Coast, we have no reason to complain, but were it not for these furnaces Eureka county would certainly not enjoy even the limited prosperity that it does to-day. Very frequently miners while prospecting strike pockets of ore which will work upward of $100 a ton, and from which they mine probably two, three and five tons. Knowing that it is salable at a fair price in town they ship the same in and at once get in return sufficient coin to allow them to continue on with their work, searching for the greater wealth they believe their properties contain. They dispose of their ore somewhat on the same principle as the rancher does his grain, vegetables, etc. The same opportunity is just what is needed by the miners about Reno, Winnemucca, Wells and points south of Eureka county. Whether the lack of these needed reduction works is the fault of the men seeking good investments or the miners we are not prepared to say, but certainly if the latter can show to the former that the establishing of such works at the places mentioned would prove paying propositions, there is no doubt but that they would be soon forthcoming. Practical men of means want to see how they are going to get their money back and also make a profit before investing.

In the immediate neighborhood of Pioche it is said there are a number of mines that have exposed in them large bodies of ore. The character of the ores is varied. Some are free-milling and others rebellious and hard to work.. To our knowledge there is but one small mill in that locality, and that has but five stamps to crush the free-milling article. Why it is that a plant could not be established there that would receive and work all characters of ore, and prove a profitable investment we are at a loss to understand. If any one seeking such an investment would give that section a visit, we feel confident they would see enough ore there to keep them busy for sometime. The Pioche *Record* of last Saturday speaking of the need says: "This part of the country is in need of reduction works. Works that can work ore that assays from $30 and upward. There are large quantities of this ore along the range, but as there are no works for its reduction it is of no account. The $60 ore is not worth extracting, for the miner can get nothing for it. The buyers cannot afford to purchase it and ship it to Salt Lake for reduction. They can afford to purchase none but ore of high grade. Reduction works for the working of low-grade ore, located down about the Eight-mile House, that would deal fairly with the miners, would yield an immense profit to its owners. The mines along the range, from Stampede to Bristol Divide, would be worked and the reduction works kept busy, but at the present state of affairs men are unable to get anything for ore that samples less than $100. If it be true it pays to work $12 ore or less in Colorado, we know no reason why from $30 to $60 ore should not pay in Nevada. There is a large field here for a company to operate in that erects reduction works for the working of low-grade ore."

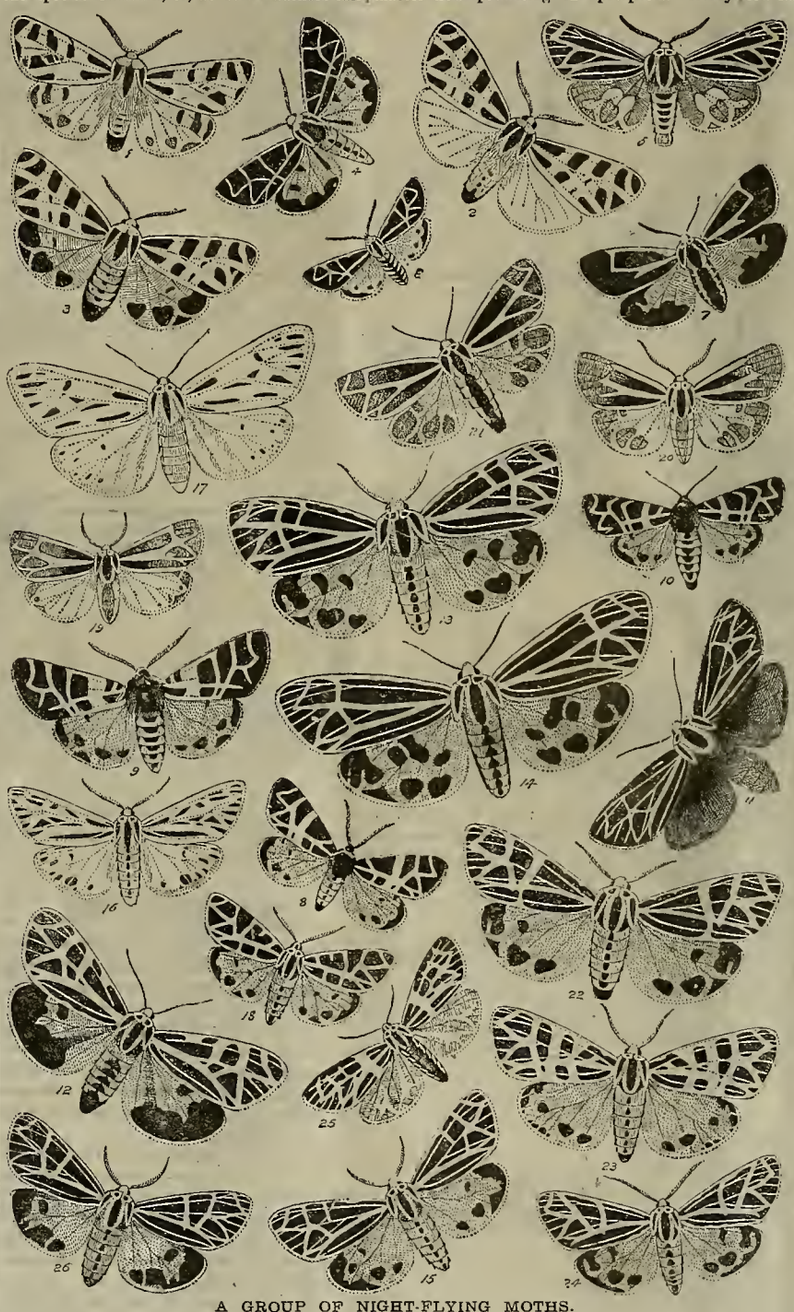
SHASTA COUNTY MINES.—While the mining outlook of this county is favorable, it must be said that "honanzas" are not as plentiful as office-seekers in Washington. That we have many permanent and lasting ledges has been fully demonstrated, and that many more will be demonstrated, there is no doubt. Men of science, who can give the most plausible theories as to nature's method of procedure in building up gold-bearing veins, are just as much at sea in determining a likely spot to find a paying gold mine, as the ordinary miner who has nothing but practical common sense to guide him in the search. It is more than probable that nature, in the formation of quartz ledges and gold channels, has proceeded, as in all her operations, in accordance with fixed and immutable laws; but the knowledge of her secret processes, as far as it would enable man to tell the exact spot where mineral wealth is hidden, she obstinately refuses to divulge. To lift gold mining from this condition of uncertainty, would only dethrone that metal from the royal position which it has so long held.

As an available field for the investment of capital in this industry, Shasta county does not pretend to hold out the certainty of the investment proving remunerative. Mining is a lottery here as elsewhere, with perhaps more blanks than prizes in the long run. We do claim, however, that there is no mineral section in this State that holds out a better hope of satisfactory returns than this county; and there is certainly no country where the natural and climatic surroundings are more favorable for mining. For the capital expended here, we believe the returns have been fully satisfactory as any gold region can boast. This fact is gradually being appreciated, and capital is slowly but surely moving this way.

A Group of Moths.

We can hardly give an engraving more suggestive of the season, the opening of summer, than the group of moths which appears on this page. The air is alive with them. Their darting about is very forcibly brought to the attention of one who strolls out during the evening hours, and their hunting against the window pane or fluttering about the lamp, makes the indoor population well aware of their presence. There is every reason to expect an unusually large crop of moths this year. Such a thing always occurs during the summer after a warm, dry winter like the last.

The engraving will serve to show how various are the forms even within a single species, and when one extends his view so as to take in genera and families, of course the variety extends almost without limit. The moths shown in the engraving are all of California varieties of the species *Chelonia*, or, as some authors call



A GROUP OF NIGHT-FLYING MOTHS.

them, *Arctia*. They are very showy, and some forms quite rare. The species are nocturnal in their habits, but sometimes they fly by day, especially the females. The caterpillars, which are the larval state of the insect, are all hairy, are not considered injurious to vegetation, that is, are not counted among the pests.

The engraving, although it will serve well enough to give a popular idea of the variety of forms of the species, is not accurate enough to serve as an entomologist's ideal representation. Mr. R. H. Stretch, of this city, has made a special study of this species and is the recognized authority. His drawings, engraved by a more delicate process, serve as standards for the identification of the varieties. He has taken upon himself the very difficult task of drawing the lines where the species begin and varieties end, and as the reader may imagine from the similarity and diversity of the few shown on this page, is becomea an undertaking of much labor and exactness. The reward is in the consciousness of well doing as it is in so many undertakings of exact science.

Idle Mines and Idle Capital.

The San Miguel *Journal* says: Never in years has there been as much idle capital as at present, and we predict that before the season closes it will turn to mining. This is all we need to bring us out. Owners of mines do not, as a rule, exert themselves to develop a country, and individual effort in most cases, unless liberally supported by capital, is powerless to open up mines extensively. Unless discoveries are unusually large and valuable the product falls short of the cost. Unless shafts are sunk sufficiently deep little or no drifting can be done, and consequently no profits can be realized. When deep shafts have been sunk primitive appliances are unavailable, and steam and other powerful machinery must be provided. Penniless men cannot supply these requisites, and unless capital steps in work must of necessity be abandoned, no matter how promising the prospects. Every mining district supplies numbers of valuable lodes lying idle and unproductive awaiting those who have money to make them profitable. This is the reason why so many mines and prospects are offered for sale. The system of leasing shafts and tunnels temporarily abandoned is bringing many new producers into the market annually. For example, a company of two or three practical miners tired of working for wages, having examined certain prospects and believing that a small amount of work will put them in pay, get a few drills, some powder and fuse and begin. In many cases their hopes are realized, and in each case a new mine offers its ore for sale. Very much of the development accomplished the past few years is attributed to this cause. Again, little syndicates of local capitalists are employing miners to open new mines. There is no great hazard in these undertakings. The cost is light and if pay is found the rewards are great. It is upon these and similar means the State is dependent for a constantly increasing supply of mines for production or sale. It will be carried on intermediately because the field is illimitable. It is a commendable enterprise, for nothing is more profitable. As the demand for good mines will continue henceforth, miners will always have all they can do to keep up the supply.

The New Smelting Works at Eureka.

Twenty years ago the smelting of argentiferous lead ores was an unknown industry west of the Mississippi river, and when the first attempts were made—notwithstanding they were made by persons familiar with the methods of smelting current in Europe—most of them proved, for a combination of reasons, utter failures. Eureka has figured in no small way as a school for the industry, inasmuch as many points have been gained by those making a study of the business from the successes and improvements achieved in it, and also by the few failures suffered since the inception of the first plant here in 1868. One writer of prominence, speaking of the industry in America, says: "It is true, Eureka, Nev., has been, so to speak, the cradle of the art of smelting in the West."

The first smelter established in Eureka that proved a success was constructed in 1869 by Mr. G. Collier Robbins, father of superintendent Frank Robbins, of the Eureka Con. Co. The knowledge and adaptability to the business appears to have been transmitted from the father to the son, for the manner in which the Eureka Con's new plant has been established would indeed be credit to one of greater years and experience than supt. Robbins.

A reporter of the *Sentinel* called yesterday at the new works, and with a large number of other visitors was shown through the plant. Everything was working as smoothly as clockwork, and were it not for the new appearance of everything one unacquainted with the situation would suppose that the works had been running for a year or longer. Slag ran off into pots, and bullion appeared as though it was nothing unusual. The new water-jacket furnace, instead of being a parallelogram in shape, as is commonly the case, is, so to speak, two long parallel sides joined at their extremities by semi-circles. It is a combination of the Rachette and Piltz furnaces. As regards its size and capacity the following figures may prove of interest:

	Inches.
Length inside jackets	81
Width inside jackets	40
Hight of jackets	42
Hight of furnace from bottom of crucible to feed floor	210
Number of tuyeres	9

Smelting capacity, 60 to 70 tons.

The water-jacket opens on top to admit of the extraction of the scale formed from the carbonate of lime in the water. A novelty in Nevada in such works is the manner adopted by Mr. Robbins and the foreman of the plant, Mr. W. J. Stevens, (who is entitled to considerable of the credit due), of drawing off the smoke, dust and fumes, these being carried away by the flue below the feed-floor instead of above it, as in the old style furnaces. The furnace is cut off at the feed-floor, and is fed through an iron box of the same shape. No smoke whatever is to be seen on the feed-floor. All ores are thoroughly analyzed and mixed in beds of 600 tons ready for smelting, and the same is delivered at the furnace by a self-dumping skip. A number of other improvements will be added to the new plant, and especially about the furnace shortly, and the chief reason for the furnace being started before all these auxiliaries were completed, was on account of space being required for the reception of ore, there being something like 3,000 tons about the works, and to continue to add to that quantity would require extra handling, and consequently unnecessary expense.—*Eureka Sentinel.*

THE NEW IDAHO GOLD BELT.—The *Wood River Times* says: Mr. Stanley, the expert sent here by U. S. Senator Jones and ex-Congressman Davis, of California, visited the head of Rock and Camp creeks yesterday. He was very favorably impressed, and says there is undoubtedly quantity, but as to quality he cannot say until he shall have made thorough tests of the samples which he takes with him. The vein can be traced on the surface for miles, is of great width, between porphyry and granite, and crops out in places for as much as 500 feet in length. Wood and water are abundant, and other working facilities favorable. The gold seems to be free, and the silver found associated with it is an indication of permanency. Now, the questions to be settled are: Will the precious metals be extracted by cheap mill process? Does the vein carry precious metals in paying quantities? The chances are in favor of the district; but as everything else is so favorable it is possible that the two requisites above stated will be lacking. However, the first one or two months' run of the mill will determine.

MORMONS are growing cotton on irrigated land in Southern Nevada.

ENGINEERING NOTES.

THE COST OF THE DISTRIBUTION OF POWER BY ELECTRICITY.—A pamphlet issued by the Safety Electric Power Company, using the Daft system, places the estimate of cost for the plant for the distribution of 500 horse-power, nominal radius of 2½ miles at $85,000, while the daily running expenses are set down at $95. It is assumed that 350 horse-power will be ready for delivery at any moment, and, following the ordinary practice of power producers, at least 600 horse-power can be rented therefrom to small consumers, limiting the delivery to, say, 10 horse-power for any one consumer; in this way an average of $150 per horse power per annum may be realized in New York City, which would therefore return a net income of $55,000 or 65 per cent per annum on prime cost. The plant for a 10-mile section of street-car lines, on the assumption that 50 cars are to be run and that 150 horse-power are ready for delivery on the track at all times, is $62,000. Fifty loaded cars may be moving at the same time. Assuming a run of 16 hours per day per car, the expenses are put at $49 or less than $1 per car, whereas the care and maintenance of 400 horses, which cost originally $50,000, is put at $286.87 per day, or more than $5 per car. Even should the figures be raised in the first case and lowered in the second, the advantages of electricity appear to be very great.

PROGRESS OF THE TEHAUNTEPEC SHIP CANAL RAILWAY.—The Government of Mexico has lately made important additions to the concessions heretofore granted to the Tehauntepec ship railway. Mexico guarantees the net revenue of the company to the extent of $1,250,000 per annum for 15 years after the completion of the road, and gives the company right to ask for additional guarantees from other governments to the extent of $2,500,000 per annum, or a total of $3,750,000, being 4 per cent on $93,000,000.

Other guaranteeing governments may have a rebate of 25 per cent on their commerce for thirty years, and a representation of two-ninths in the Board of Directors. The company has a right to establish coaling stations, and to import coal free of duty, to furnish ships in transit, and also the right to collect all tolls, except those from Mexican commerce, in gold, a difference in favor of the company of about 18 per cent. There are several other minor concessions granted, such as the right to establish two tow-boat lines independent of taxation, and to collect harbor dues.

A NEW SHIP CANAL SCHEME.—The construction of a ship canal from Rochester up the valley of the Beaver river to Lake Erie is being talked of, and will probably be undertaken before very long. The projected canal will pass through Beaver, Lawrence, Mercer, Crawford and Erie counties. There are many advantages to be gained, among them the fact that these counties are rich in deposits of limestone which now is transported to Western Pennsylvania at a cost of 60 cents per ton, and could be taken by water were the canal constructed at a cost of only 10 cents. The advantages to the iron men of the Keystone State are by no means the only ones, or even the most important to be gained by the construction of such a water way.

SAFE LOADS ON IRON COLUMNS.—Navier gives one-fifth of the breaking weight as the safe load of an iron column in practice. Francis, an American engineer, gives the same, while Morin adopts one-sixth as the rule. Iron pillars supporting loads free from vibration, such as water tanks, will safely carry one-fifth their breaking weight. In factories or stores where moderate vibrations occur, the working load should not exceed one-sixth, and if the supports be liable to transverse strains or severe shocks like those on the ground floors of ware-houses, where loaded wagons or heavy packages are apt to strike them, the load should not exceed one-tenth.

TELEGRAPHIC COMMUNICATION AT SEA.—A French officer of engineers has conceived an idea for enabling vessels upon the high seas to communicate with the shore by means of the existing submarine cables. He proposes that these cables shall be supplied at convenient intervals with short branches, the free ends of which shall be buoyed in such a manner that passing vessels, provided with the necessary batteries and with a key by which to obtain access to the wires, may telegraph home. Experiments to test the feasibility of the scheme are about to be begun, and several branches are being attached to the cable which connects Algiers with Marseilles.

AN EXTENSIVE IRRIGATION ENTERPRISE.—A company has been organized in Florence, A. T., with a capital of $10,000,000, for the purpose of constructing a large canal from a point 13 miles east of Florence, and reclaiming all the mesa lands for a distance of 75 miles down the Gila river and from 10 to 20 miles back from it.

VOLCANIC ERUPTIONS AND MINES.—Herr Jall, who has made a special study of volcanic eruptions, advances the theory that explosions in mines usually occur about the same time as earthquakes. He warns the mine-owners of Europe that June 12th, July 12th, September 8th and September 24th are days very likely to prove dangerous.

USEFUL INFORMATION.

HOW TO SPLIT A BANK NOTE.—The remarkable operation of splitting in two the paper on which a bank note was printed was accomplished by a Kentucky counterfeiter. The two sheets made were nearly transparent. He made a plate of copper and brass, a little larger than the bill, and spread one of the sheets on top of it. With a steel tracing pencil of his own manufacture he engraved through the sheet the exact counterpart on the plate. The other half was engraved on another plate in a similar manner, and then he was ready for printing his spurious money. This method of workmanship looks very simple, but it is the first time it had been done by a counterfeiter, as it is said to be almost impossible to split the bill. However true this reported difficulty may be, it is generally an easy matter to split a sheet of paper. Paste a piece of strong cloth to each side of the paper to be split. When dry, violently pull the two pieces asunder, when part of the sheet will be found to have adhered to the one and part to the other. When the paste is softened in water the paper can be removed from the cloth.

BROWNING GREEN BARRELS.—Take spirits of nitre, one pound; alcohol, one pound; corrosive sublimate, one ounce. Mix in a bottle and keep corked. In using it, plug both ends of the barrel and let the plugs stick out four or five inches to serve as handles, and also to prevent the fluid from entering the barrel and causing it to rust. Polish the barrel perfectly, then rub it well with quicklime by means of a cloth, which will also remove all oil or grease. Now apply the browning fluid with a clean, white cloth. Apply one coat and set in a warm, dry place, until a red rust has formed over the whole surface. The time required for this in warm weather is from 10 to 12 hours, and in cold weather from 15 to 20 hours. Then card it down with a gunmaker's card, and rub it off with a clean cloth. Repeat this process until the color suits, as each coat gives a darker shade.

ORIGIN OF CARRIAGES.—The oldest carriages used by the ladies of England were called whirlicotes. These became unfashionable after Ann, the daughter of Charles IV and Queen of Richard II, about the end of the fourteenth century, showed the ladies how gracefully they could ride on a side-saddle. Coaches were first known in England in the year 1530. They were introduced from Germany, by the Earl of Arundel. They came into general use among the nobility in the year 1605. The celebrated Duke of Buckingham was the first who rode in a coach and six horses; to ridicule this pomp, the Earl of Northumberland put eight horses to his carriage. Coaches to hire were first established in London in 1625. There were only twenty of them kept at the principal inns. In the year 1637 there were 50 hackney coaches; in 1654 there were 200; in 1694 they were limited to 700, and in 1755 to 800; there are now 1,100.

STAIN-REMOVING SOAP.—A universal stain-removing soap for use in bleach, print and dye works is thus described in the *Moniteur de la Teinture*. "Take 22 pounds of the best soap and reduce it to thin shavings. Place the soap in a boiler with 88 pounds of water and 13.25 pounds of ox gall. Cover up and allow to remain at rest all night. In the morning heat up gently, and regulate it so that the soap may dissolve without stirring. When the mass is homogenious and flows smoothly, and part of the water has been evaporated, add 0.55 pound of turpentine and 0.44 pound of benzine and mix well. While still in a state of fusion, color with green ultramarine and ammonia, and pour into molds, where it should stand several days before used.

A NEW METAL DRILLING TOOL.—A metal-drilling tool of new form has been patented by T. Scheffler, of Paterson, N. J. The cylindrical head of the tool which carries the drill is surrounded by two half-rings which rest in a groove cast around the head. A cam enters between two of the adjacent edges of the half-rings. A handle made with an eye at one end surrounds the head. This handle is provided with an irregular socket which receives the cam. On moving the handle to the right the cam forces the half-rings apart, so that the latter friction tightly up against the head and force it around. On the reverse motion of the handle no strain is placed on the rings, and they simply revolve loosely with the handle.

GLUE.—The glues generally used have the inconvenience of leaving yellowish traces, which have a disagreeable appearance, especially if the articles to be joined together are transparent. The following process yields a glue, gum or cement which is absolutely colorless. Mix in a stoppered bottle sixty parts of chloroform and seventy-five parts of caoutchouc cut into very small fragments. When it is dissolved and the mixture is quite fluid, add fifteen parts of mastic in tears and let the whole digest for eighty days. The glue thus prepared is used in the way commonly directed for joining glass, porcelain, etc.—*Manufacturers' Gazette.*

A NEW PREPARATION OF WOOD.—A French chemist recently exhibited a piece of wood that shone like, and resembled a metallic mirror, having produced this effect by soaking the wood two or three days in an alkali caustic heated to 164 degrees and 197 degrees. The wood was then placed to soak in another liquid, hydrosulphate of calcium, to which he added after 38 hours a concentrated solution of sulphur. After remaining in this a couple of days, the wood is put into a third bath similar to the first, in which it remained about 50 hours, the bath being heated to 95 degrees and 122 degrees. When thoroughly dry the wood was scraped with tin, zinc, and then with a piece of glass or china, when the wood shown, as remarked above, like a metallic mirror.

STAINING WOOD TO RESEMBLE CEDAR.—As a simple method of imparting to any plain white wood the appearance of cedar-wood, the following process is recommended: Mix two parts of caoutchouc and one part of caustic soda, in one hundred parts of water (all by weight). The article to be stained should be boiled in this solution for some hours, and is then rinsed in clear water and dried. If the desired depth of tone has not been obtained, a second boiling must be resorted to. This stain is said to sink so deep into the wood that even thick sheets of veneer thus treated will be colored right through, while other wood articles thus stained may be safely manipulated without any fear of the original color of the wood showing through.

THE FIRST CLOCK which appeared in Europe was probably that which Eginhard (the secretary of Charlemagne) describes as sent to his royal master by Abdallah, King of Persia: "A horologe of brass, wonderfully constructed, for the course of twelve hours, answered to the hour-glass with as many little brazen balls, which drop down on a sort of balls underneath, and sounded each other." The Venetians had clocks in 872, and sent a specimen of them that year to Constantinople.

CANNED EGGS.—The list of goods canned has been enlarged by a company in St. Louis, which has begun canning eggs. A factory has been erected, and is now in operation, where they will can 1,000,000 dozen annually. The eggs are put through some sort of a process by which the yolks and white are separated from the shells, and the substance is then dried and canned. One teaspoonful is said to be equal to one egg, and it is warranted to keep fresh for three years.

PAPER PLATES.—A landlord in Berlin has introduced paper plates. Bread and butter, cake and similar articles were served on a pretty *papier mache* plate, having a border in relief and resembling porcelain. The landlord liked them because they were so cheap they could be thrown away after once using; waiters liked them for their lightness, and because they were neither to be washed nor broken, and guests were delighted to take them away as souvenirs.

GOOD HEALTH.

The Management of Scarlet Fever.

Scarlet fever is spread by contagion—by the transfer of particles of living matter from a person suffering from the disease. These particles of living matter come from the skin, from the membrane lining of the mouth, nose and throat, and perhaps also from the intestines and urinary organs. It is a disease which it is specially desirable to prevent the occurrence of in young children, partly because the susceptibility to its cause diminishes greatly with increase in age, and partly because it is much less dangerous in adults. There is reason to question the wisdom of using costly and troublesome methods of preventing the spread of measles, because the susceptibility to the cause of this disease remains in adult life, and it is, if anything, more liable to result in dangerous lung complications in advanced age than it is in children; but there can be no doubt as to the wisdom of restricting the spread of scarlet fever as much as possible.

The precautions to be taken when a case occurs in a house are in many respects the same as in a case of diphtheria—namely, to isolate the patient in an airy room having the least possible amount of furniture. The room should have no carpets or curtains, and no upholstered furniture, such as lounges, sofas, stuffed chairs, etc.

All the secretions and excretions, and all articles soiled by them, should be disinfected thoroughly and promptly while they are yet moist. A special and important precaution is to keep the whole surface of the body thoroughly annointed with some bland fatty matter, such as camphorated oil, vaseline, or cosmoline; and especial care should be taken to do this when convalescence has set in and the peeling off of the skin has commenced. All toys, books, etc., handled by the child are dangerous, and had best be destroyed in the room by fire, or by putting them into a vessel containing a strong solution of bichloride of mercury or of chloride of zinc.

No clothing, bedding, towels, or other woven stuffs should be taken from the room while dry; they should be placed in a tub or wash boiler containing scalding hot water, and thoroughly boiled before they are allowed to dry.

When the peeling of the skin has entirely ceased, the patient should be thoroughly bathed—using warm soap and water—be dressed in entirely fresh clothing, and the room and its contents should be thoroughly disinfected. The average period during which complete isolation of the patient is required, and during which he should not go out of his room or receive any visitors, is five weeks. Usually six weeks will be required to secure absolute freedom from danger.

The walls and ceiling of the rooms should be rubbed with damp cloths, which should be at once burned or boiled. The floor and all wood-work should be thoroughly scrubbed with soap and water.

The windows, fireplace, doors and all other outlets of the room should be tightly closed, and sulphur burned in the room in the proportion of one pound of sulphur to each thousand cubic feet—that is, if the room is 15 feet square and 11 feet high, about two and a half or three pounds of roll brimstone will be required. Put the brimstone in an iron kettle and place the kettle on a tray of sand three inches thick, or on a platform of bricks; pour a wineglass of alcohol on the brimstone and set fire to it, leaving the room immediately, as the fumes are dangerous. Let the room remain tightly closed for 24 hours, then open all the windows and the fireplace, and let the fresh air circulate in it for from 24 to 48 hours.—*Exchange.*

HEALING PROPERTIES OF WATER.—There is no remedy of such general application and none so easily attainable as water, and yet nine persons in ten will pass it by in an emergency to seek for something of less efficacy. There are but few cases of illness where water should not occupy the highest place as a remedial agent. A strip of flannel or a napkin folded lengthwise and wrung out of hot water and applied around the neck of a child that has the croup will usually bring relief in ten minutes. A towel folded several times and quickly wrung out of hot water and applied over the seat of the pain in toothache or neuralgia will generally afford prompt relief. This treatment in colic works like magic. We have known cases that have resisted other treatment for hours yield to this in ten minutes. There is nothing that will so promptly cut short a congestion of the lungs, sore throat or rheumatism as hot water when applied promptly and thoroughly. Pieces of cotton-batting dipped in hot water and kept applied to all sores and new cuts, bruises and sprains is the treatment now generally adopted in hospitals. Sprained ankle has been cured in an hour by showering it with hot water, poured from a hight of ten feet. Tepid water acts promptly as an emetic, and hot water taken freely half an hour before bed-time is the best of cathartics in the case of constipation, while it has a most soothing effect on the stomach and bowels. This treatment continued for a few months, with proper attention to diet, will alleviate any case of dyspepsia.

TICKLED TO DEATH.—The degree of annoyance caused by a small object like a hair, a grain of sand or a tiny splinter depends entirely on the location. All are not ticklish or hypersensitive at the same place. Some can be thrown into paroxysms by tickling the feet with a straw, others go into spasms if a feather is drawn under their nose, while others almost take a fit if tickled in the ribs. It is said that the most exquisitely horrible torture practiced during the Inquisition was that of tickling the feet of sensitive heretics. Every nerve in the entire body was set on end and made to dance at a maddening pace. This must have been the refinement of torture, indeed. In order to satisfy your curiosity on this score, have your hands securely tied and your head held firmly, while some one slowly, gently tickles your nose with a feather, or even with a hair. You will soon conclude that death would be preferable to a continuance of the torture. A case of *killing* was recently reported in Europe, where, on trial, it came out that a man had killed three wives. In each case the victims were bound and tickled to death by slight application to their bare feet.

THE ALCOHOLIC DISEASE.—An examination of alcoholic intemperance in its origin can only terminate in one result—that is, in the conviction that it belongs, both physically and morally, to the class of fermentative or zymotic diseases. No mere deprivation of natural appetite will produce it; never does it exhibit itself until alcohol has been consumed; and what is especially to be remarked is, that alcohol acts in the production of the intemperate habit by poisoning the blood and arresting the healthy operation of the nervous system. It attacks the higher faculties; those qualities which give a moral tone, and lead man up to true happiness and a virtuous life. It dethrones reason, and retrogrades its victim to the level of the brute. In this manner, and in no other, the craving for alcoholic drinks is produced—which is always a physical malady in its inception—until by continuous indulgence it takes a settled and chronic form, leading its victim through the stages of *mania a potu, dipsomania, epilepsy,* and numerous forms of mental and physical depravity.—*Quarterly Journal.*

A PECULIAR DEVELOPMENT.—Workmen in the St. Gothard tunnel were affected with a peculiar disease which seemed to be caused by minute worms. The same malady has been observed among brick-makers. From the latest researches it appears that the worms develop in muddy water, which the workmen carelessly drink.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MAHONEY.—Amador *Ledger*, May 30: At the Mahoney affairs remain about the same as last week. W. A. Nevills went over to Sutter creek last Monday for the purpose of going down the shaft and inspecting the lower levels. The water, however, was several feet deep in the 800-foot level, and of course it was useless to attempt to go down. The mortars for the mill in Hunt's gulch arrived here early this week. All the machinery is now on the ground. The mill is expected to be in running order in less than two weeks. The hoisting works at the Moore mine are being replaced on the old shaft, with new framework where necessary. The shaft on what is called the Limestone lead has been abandoned, the prospect at the bottom not proving sufficiently encouraging to warrant extensive explorations at that point. The building which has been erected at the mouth of the big tunnel at Middle Bar is partly designed for a roasting furnace, which has been a want long felt in treating the rich but rebellious ores met with in that district. The present contract at the Middle Bar tunnel will be completed next week. The tunnel will then be in a distance of over 2,300 feet. It will be necessary to get heavier machinery before the tunnel can be carried much further. It is the intentin, however, to cross-cut at various points before attempting to push the header further.

Butte.

BED OF THE RIVER.—Gridley *Herald*, May 28: After duly prospecting the claim, a number of our citizens have organized a mining company for the purpose of working on the American Bar in Middle Fork of Feather river. They intend to turn the water out of the river into a canal, for a distance of 900 feet, and work the bed of the river. This has been done before, and the old canal is still there, ready for use. Similar operations immediately above and below the claim have, in days gone by, paid big money. Saturday, E. W. Noteware (who is temporary foreman), departed for the claim, with all the necessary machinery and a crew of laborers. An under-shot wheel, fourteen feet in diameter, will be used for pumping the water into the shices, in connection with a twenty-inch pump.

Calaveras.

WEST POINT.—Cor. Calaveras *Chronicle*, May 30: The Russell Furnace and Mining Co. have, after some delay, started up again. They have bought out Camille and Beauchemin in the Lockwood mine; price paid, $5 000. They are sole owners now of the Lockwood and Point mines. The former is in splendid condition, exhibiting a ledge 10 inches in width, which shows gold freely. Old miners estimate that the ore will yield $80 per ton in free gold. Many years prior to the present owners taking hold of the mine, it had been worked and very rich ore extracted from it, but after a certain depth had been attained the pay ore gave out, but sinking was continued until all efforts proved unavailing to regain its former prestige. Subsequently the mine was abandoned. The present parties followed the same tactics with dire results, till some one suggested that it would be a good scheme to crosscut into the footwall. The advice was followed, and the result was favorable in the extreme as a first-class body of ore was uncovered. Its extent as yet has not been ascertained. The Point mine is a property that looks very promising also. The work of repairing and placing additional machinery at the Russell furnace is going on with vigor. A large force of skilled workmen are busily engaged, and the work is being prosecuted with neatness and dispatch. A capacious boarding-house is being erected for the accommodation of those employed at the furnace. Two hundred cords of pine wood have been purchased, and will soon be placed under the shed. The Russell company have about 280 tons of sulphuret ore. The work of reducing the ore will be commenced as soon as the furnace is in working condition, which will be in about ten days. The Simpson furnace is undergoing repairs and improvements, such that will aid to make it a complete success. Simpson & Co. do not own and work mines. Their business is to purchase ore from the miners. They have already bought ore from the following parties: F. Crockett, 17 tons at $35 per ton; A. Keltz, 10 tons at $100 per ton; Sterling & Co., 6 tons, price unknown. Chances are quite favorable that they will purchase the second-class ore from the Lone Star and Reed & Hillary dumps. A sample of 200 pounds was worked from the aforesaid mines which gave a most satisfactory result, however 10 tons will be worked in order to give it a more thorough test. There are over 1,000 tons of the ore. Sinking is being prosecuted in the Keltz mine. The ledge shows as well as ever in the bottom, about 12 inches in width, and will yield $100 per ton. Longitudinal extent of ore body has not been determined as yet as no levels have been run. A rich discovery has been made in the Del Monte claim.

Inyo.

SMALL THINGS.—*Independent*, 30: George Thorpe and Jim Jenkins have been at work for several montbs past prospecting the Indiana claim, near Ceeler. It might appear that their labor was wasted when it is stated that as a result of seven months' work they had secured only eight tons of ore; but that ore is worth over $400 per ton and when all expenses are paid the two men will realize over $100 a month for their work. These men were not subject to any boss, they came and went, worked or played as pleased them, and surely the above figure is very fair wages. There are hundreds of similar small veins of ore in the Inyo mountaids.

Mono.

THE STANDARD MILL.—Bodie *Free Press*, 30: The whistle of the Standard Con. mill—the Old Reliable—echoed loud across the canyon this morning and brought vividly to mind pictures of the prosperous past. President Pettibone states that the ore on hand and that being extracted is sufficient to keep the mill supplied indefinitely. The mill required considerable overhauling and new pipes had to be laid in place of the old ones bursted on account of leaving them in water. The thunder of the stamps will be heard in a few hours.

CON. PACIFIC.—Since last report the drift to cut Pacific ledge No. 2 has been advanced 7 feet. During the week cut a small vein of about 7 inches, but have some reason to doubt it being No. 2 vein. Its course would indicate that it will run into No. 3. As they continue their cross-cut a short time will determine. The vein cut, though small is valuable, a first-class showing from the ore being obtained from the horn. Everything in and about the mine is looking well.

STANDARD CON.—The north drift 400 level has been extended 19 feet. The west cross-cut from 1st south, 400 level has been extended 16 feet. The south drift from the same has been extended 10 feet. Have repaired the main upraise 3d south 165 feet. The north drift 560 level has been advanced 19 feet. The south drift on the same has been extended 9 feet. The stopes are looking well.

Nevada.

DELHI.—North San Juan *Times*, May 27: We saw the other day some quartz taken from the 300-level of the Delhi mine which showed free gold in large quantities. It had the appearance of having been run into the rock while in a molten condition. A small piece taken from the surface rock was still richer in gold than the other. The vein from which the first-mentioned rock was taken is 11 feet wide. All the rock taken out is milled; there is no refuse rock whatever. This mine is certainly the richest quartz mine in the county. This month's run will probably yield $12,000, besides the sulphurets, of which there will be many tons, and which will produce $100 to each ton.

STARTED UP THE MACHINERY.—Nevada *Herald*, May 28: This afternoon the new hoisting machinery at the Cap. Fleming mine was started up. All the stockholders in this promising property, besides several invited guests, were present to witness the starting. Everything worked smoothly and those interested felt satisfied with their late investment.

Placer.

CHICAGO MINE.—Cor. Placer *Argus*, May 28: We descended the main shaft to the 100-foot level, thence we proceeded along through a drift about 200 feet, then descended into the stopes, in which about 16 Chinamen are at work taking out ore, each having a stope of his own, and being strung along about 100 feet on each of the winze, (through which we made the descent) one under the other, so that the working of one stope does not interfere with the others. They carry a five-foot face. After passing down through the stopes we went through the ore chutes, which are built above the 200-foot level. There we found a supply of ore, some of which I examined and found to be rich in sulphurets, and there is promise of a fair return on the free milling ore. At the 200 foot level I went north a distance of 300 feet to the face of the drift, where I found a well-defined ledge of sulphuret ore, about two feet in size, between walls of solid granite as smooth as polished marble, thus showing conclusively that the Chicago is a true fissure. It is the intention of the management to sink 100 feet more immediately, and open up the mine on both sides of the shaft by running levels north and south. They have as fine a 10-stamp mill as there is in this section of the country. It seems to be complete in every department, having a No. 6 Golden Gate concentrator. It has all the late improvements of machinery of that character, and has to be seen to be appreciated, Owing to the repairs going on in the shaft they are not running the mill, but Mr. Hall says they can get the mill ready in two hours' notice. He expects to be in full blast by the 4th or 5th of June at the latest. In looking over the mill I noticed the peculiar brightness of the apron and silver plates, and on inquiry found that they are using the electric amalgam manufactured by Dr. Ray & Co., San Francisco, which supersedes quicksilver, and is likely to take the place of all chemicals heretofore used for amalgamating purposes, the mill foreman at the Chicago saying that it is a saving of 50 per cent over all other material or preparations heretofore used by him.

MORE OF THE MAYFLOWER.—*Herald*, May 30: Two weeks ago we mentioned the fact that at the Mayflower mine, near Forest Hill, they had struck the main divide channel, and were taking out some very rich gravel. Mr. P. Crary, who returned several days ago from another trip to that divide, says the channel is wide and known to be very extensive, and the richness of the gravel beats anything he ever saw, and he is an old miner. There are chunks of it that seem to bave only rocks and cement enough to hold the gold together. One pan from some gravel taken out while he was there was washed and had in it in 22½ ounces of gold, or about $400. The developments in the Mayflower will give a stimulus to other mining enterprises in that locality, and thus enhance the prosperity of the community, and indirectly of the entire county.

Plumas.

FOUR HILLS MINE.—Greenville *Bulletin*, May 30: Robt. Penman, just over from the Eureka country, says that a sale of the Four Hills mine for a large sum, is reported. This mine has been very rich, but the owners were unable to properly develop it. It is contended that it will be a second Plumas-Eureka.

GOLD STRIPE.—The air shaft was completed last week, and now the work of pushing the tunnel ahead is in progress. Several men are employed, and work will be prosecuted as energetically as possible. The prospects of this mine are good, and if developed, it is thought that it will be one of the best pieces of property in the district.

FOREST KING.—Work in the mine continues with regularity. Pay ore is being taken out and sent to the Arcadia mill. A few days ago the large belt gave way so completely that the mill had to stop until a new belt arrives, which is expected to-day. Immediately upon its receipt, the mill will be running again. Since the crushing of ore began, the product of gold has been satisfactory.

GREEN MOUNTAIN.—The upraise in the Sulphuret chute has reached a distance of 90 feet. The air is not sufficient to run the drills and supply the upraise. The tunnel, therefore, is being pushed ahead by the use of hand drills. Work on it will so continue till the upraise connects with tunnel No. 5. Stoping in the Sulphuret chute continues, and the ore is being sent to the mill. There has been no change in the character of the rock since the last report. The quartz in the upraise prospects about the same as that in stopes. There has been some trouble in consequence of a large amount of water to contend with, but the quantity is becoming less, and the trouble from that cause will have ceased entirely by the end of two weeks. The mill is running regularly, and good worked is being done.

Sierra.

CLEAN-UP.—*Mountain Messenger*, May 30: Bald Mt. Extension Co., Forest city, cleaned up for last week's work 106 ounces, and for the previous week 139½ ounces. Red Oak tunnel is now 502 feet long, and the face is now in soft slate rock. Cap. Wilbourn and J. T. Mason left for the mine Thursday morning. The pump at the Extension shaft will be started up next week, to furnish water for washing gravel, and for air. Parties from Buttes are making preparations to run a prospect tunnel at the head of Secret ravine.

Trinity.

DOING GOOD WORK.—Trinity *Journal*, May 30: J. R. Flagg, foreman in the Hayes Red Hill gold mines, tells us that they are doing splendid work in the McKinney mine. Three large size giants are in use, water is plenty in the Canyon creek ditch, and gravel is being moved at a rapid rate. The prospects are also reported as being most satisfactory.

BIG PROSPECTS.—The Eureka *Times-Telephone* says word has reached that city that a rich strike has been made in the Hunter mine, at New River, and that the prospects were equal to those of the Hard-Tack, the best mine in the district. The Hunter is owned by W. H. Johnson and other residents of Eureka.

PUSHING WORK.—Smith B. Brooks arrived from New River on Friday morning, and reports work at the Mary Blane as progressing rapidly in both mine and mill. They are sinking on the ledge, and the developments of the past few days show it to be better than ever before. The Murchie Bros., late of Nevada City, have charge of operations, and are represented as experienced and intelligent miners.

PROSPECTING.—Messrs. Geo. W. Ward, P. H. Riffe, Boswell and Jones arrived this week from Shasta county, and will spend some time prospecting in Trinity. Mr. Riffe is regarded as an expert seam or pocket prospector. From a recent find in the vicinity of Muletown, he pounded out 15 pounds of rock and realized 10½ ounces of gold.

SCARCITY OF WATER.—Mr. H. Hickok, who has been superintending the Buckeye property the past season, was in town this week. Like all other hydraulic miners of the county, he complains of the scarcity of water during this season, five hours water per day being the most they were favored with. The Buckeye ditch was not full at any time.

BETTER YET.—In referring to the recent clean-up from Monte Christo ore in Deadwood District last week, we did not get the yield large enough. The quantity of rock crushed was 62 tons, and the amount realized was $6,700, exclusive of sulphurets. Messrs. Ramm & Van Metre were in town this week and inform us that there is more of the same kind of rock in sight. And yet Deadwood has never had any great boom. But its mines are the best on the Coast, and they are building slowly and solidly on their own merits.

Tuolumne.

PIPE.—Tuolumne *Independent*, May 30: The pipe for the Gold Mt. Water Co. arrived Sunday night for the connection at Divoll's mill. A. A. Moore has the contract to put it in place, and the work will probably be completed by to-day. Divoll is actively at work making an underground map of the Bonanza and its workings. All the gold heretofore taken out has been from the hanging wall, which, he says, is a mere prospect to what may be expected when the foot-wall is mined.

ACTIVE.—*Union Democrat*, May 30: There is more business activity in Soulsbyville now than has been the case for a long time. The recent rich developments in the Soulsby mine and the consequent large increase in the working force are the causes of the revival. The mine is now working between 45 and 50 men. Stoping is being vigorously prosecuted on a large body of very rich ore, enough of which is in sight to keep the mill running for a year or two. A favorable report comes from the Lamphier mine which is steadily working with a good force. A new development has been made at the south end of the mine which promises to be of great value. A chute of very fine milling quartz was recently struck near the surface. It is being rapidly developed and promises to turn out an extensive deposit. This discovery has greatly enhanced the value of the property. The Stanislaus River Gold Mining Co. is pushing operations on the big tunnel to turn the Stanislaus river at Reynolds' Ferry. Work is being prosecuted at both ends with day and night shifts. The south end of the tunnel is in about 350 feet and the north end over 200 feet, leaving only about 500 feet to run. The shaft at the Hyde mine is being sunk as fast as three shifts can do it. It is now down 230 feet, and the progress is at the rate of two feet every 24 hours. The vein is large. Recent assays run from $13 to $104 per ton. Ben Seeber continues to make good runs from the Chrysoline mine at Whisky Hill.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, May 30: Since last weekly report both lower levels have been thoroughly cleaned out from the mud and debris resulting from the flood, the timbering repaired and work on the 3,000 level resumed. Cross-cut No. 1, 90 ft north of the Chollar line, has been started up, and is steadily being advanced westward. It is now in 85 ft; and the last 30 ft is in quartz of fine quality, showing considerable ore. Nothing is being done on the 2,900 level, by reason of all the force and air being needed in conducting operations elsewhere. On the 3,000 level, the main lateral drift north was started up again day before yesterday and is making good progress in good working ground. Its course has been changed a little more to the westward, in order to range gradually into the ore vein which is about 40 ft distant. The advancement of this drift toward the Savage mine possesses considerable significance, as developing the Hale and Norcross ore vein in that direction. It has a very good show and plenty of room to develop into a real bonanza at that point. The air gallery on the 2400 level, to connect with the northwest drift to the Savage incline for air circulation purposes, is making very good progress. It is already advanced 60 ft, and has about 100 ft further to go. This large drift, or gangway, when completed will be a very important addition to the ventilation facilities of the mine. In fact it is indispensable to the working of the levels below.

CON. CALIFORNIA AND VIRGINIA.—The drift connection with the Gould and Curry 1,700 level is well completed, put in first-class order, and furnishes a splendid ventilation to a quarter where it has been very much required. From the 1750 level 571 tons of ore were extracted last week, assaying $22.55 per ton. From the stopes of the 1,200 and 1,350 levels, under the Jones contract, 878 tons were extracted, assaying $18.62 per ton from mill battery samples. The framework of the new building over the old Consolidated Virginia hoisting machinery is inclosed and will soon be completed. The timbering around the mouth of the shaft is renewed and in first-class order, and the platform around it and beyond it is renewed of two and a half inch plank, ready for the erection of additional building if deemed requisite. The old shaft is found to be in very bad order at several points, requiring substantial repairs. This will probably be done, for the machinery is of the best order and all that is required, and the shaft is important for ventilation and ore hoisting.

BALTIMORE CON.—The new roasting furnace is completed, and fire has been started under it. Ore hoisting from the 450 level, which the tributers had stored away in the drifts, commenced Thursday morning, the main hoisting works being started up for the purpose. Only enough was hoisted for a commencement test of the new furnace, which was being charged yesterday with pulp from the little 5-stamp mill near by. A few tons of high grade ore are being hoisted from the 225 level, and the parties working at that point find a very good ledge in their winze, of the same character ruby silver, etc., as that being worked on the 450 level.

CROWN POINT.—The shell of the old bonanza holds out well, and gives pretty good gleanings and plenty of it, the old ore stopes yielding a very good showing of low grade ore. The Belcher upper levels worked through the Crown Point, also hold out well.

CHOLLAR.—The 3,000 level has been cleaned out and put in complete order since the flood, and work is resumed in cross-cut No. 3 west, the face of which is in very promising vein matter, carrying spots and bunches of ore.

ALTA.—The prospecting above the 950 level have extended to about the 850 in the shape of an upraise following the vein in the foot wall. Good bunches and stringers of fair grade ore continue to be met with.

OPHIR.—On the 500 level the crosscut to connect with the old Mexican shaft is progressing well, and joint cross-cut of the Ophir and Mexican on this level is making good advancement.

WOODVILLE.—The tributers on the 400 level find some very good bunches and streaks of ore that gives pretty healthy assays, and will doubtless give satisfactory milling returns.

YELLOW JACKET.—The regular good yield of ore from the old upper workings continue right straight along. The stopes about the 400 level especially are looking and yielding finely.

OVERMAN.—About a dozen tons per day of low grade ore continues to be the yield from the 226 level through the old Petaluma-street tunnel.

MEXICAN.—The joint Union and Mexican drift on the 500 level and also the west cross-cut on that level are both making good progress.

GOULD AND CURRY.—East cross-cut No. 1, near the Savage line, on the 1,000 level, is going ahead well in favorable ground.

BULLION.—The drift from the 160-foot station, west, has passed into fine looking quartz carrying spots of ore.

KENTUCK.—The old upper levels continue to yield partly enough low grade ore to keep the Rock Point mill running.

SIERRA NEVADA.—The north lateral drift on the 520 level is making rapid progress in very favorable working ground.

BEST AND BELCHER.—The joint drift on the 1,000 level is making good advancement in favorable working ground.

Antelope District.

WHAT IS IT.—Genoa *Courier*, May 25: Parties interested in the so-called tin mine in Antelope district have great faith in the discovery. As yet they have not been able to determine what the ore contains, but when the rock is burned a metal resembling pewter is obtained which, when cool, is much harder than iron or steel. The tinsmith who happened to be traveling through that part of the country at the time of the discovery, had worked for 20 years in the tin mines of France, and he believes they have tin ore. The rock has been assayed in different offices on the coast and some of it sent to Europe, but thus far nothing definite has been learned. It is believed by some that the rock does not contain tin, and that the metal is aluminum, which is more valuable than tin. Aluminum forms alloys with most of the metals.

Castle Dome District.

SILVER ORE.—Cor. Eureka *Sentinel:* Castle Dome district, a few miles below Willow creek, on the same range of mountains, has had quite an excitement over a rich lead of silver ore struck some two months ago, and assaying way up in the thousands. We do not hear much of it lately, but we believe it still holds out, though the rich seam is very small. Rich float may be found all over this range. Very little good prospecting work has been done, but what has been done shows better results than I have seen in any other camp in the State. There is a fine field here now for good intelligent prospectors—plenty of feed on the hills and water in every canyon.

Esmeralda District.

CAPITALISTS.—Carson *Free Lance* May 25: Mr. J. C. Coulter, in company with English capitalists, is here. The result of the visit of these people will be made known in due time. Mr. Coulter has been persevering in his efforts to have an English company take hold of some Aurora mines, and now that they are represented here, large sales are confidently anticipated to be made. Should such good luck befall, Aurora will again resume its place among the towns of mining note in Nevada.

Lewis District.

RUNNING.—*Butte Mt. Nevadan*, May 26: The Pittsburg Mining Company's mill is running steadily

and the regular shipment of bullion is being made. A one-third interest in the mine has been sold to Mr. Cardwell. Mr. G. W. Bothwell is building an addition to the mill, and will put in another crusher for the purpose of working Morning Star ore. The mines are looking well, with plenty of ore in sight. A force of men are at work on the Eagle mine, extending the main drain level and sinking. There is quite a pile of ore on the dump, and prospects are good. The Betty O'Neal hoisting works, machinery and mining tools were sold at Sheriff's sale Thursday, for costs of judgment obtained by R. Gillis, J. F. Dennis being the purchaser. The boiler and machinery will be put in order, the water pumped out, and prospecting on the lower levels commenced right away. A force of men are to be put on, and the work prosecuted as rapidly as circumstances will permit. J. W. McKittrick will be superintendent of the mine. Ten tons of ore have been shipped from the Betty O'Neal to Salt Lake for reduction, the owners being desirous of learning its actual market value.

Mount Cory District.

WORKING.—Walker Lake *Bulletin*, May 27: A few men are working in the Mount Cory. Work on the Jumbo tunnel will soon be resumed. There is a talk of a small mill for Coon Hollow. A day shift has been put on the Gypsy Queen by Al. Finney. There will soon be four or five paying mines in Coryville. Another ledge has been uncovered in the North Star ground. It assays well. The Snowbird, North Star and Silver Brick mines are all sending out ore of good quality.

Red Canyon District.

GOLD.—Carson *Free Lance*, May 25: Another body of rich gold rock was encountered in the Knox & Nixon mine in Red canyon, last Thursday. This strike is made in one of the deepest levels in the mine and is supposed to be a continuation of the rich chimney cut in one of the upper drifts last December. Some of the specimens consist of about equal parts gold and white quartz, and are very beautiful. This is the fifth rich strike that has been made in that district within as many months, any one of which, if made in any other part of the world than Red canyon would have set people wild with excitement and induce the investment of thousands of dollars in prospecting. In this instance we have not heard of a single mining man even going out to look at it.

Secret Canyon District.

LEASE.—Eureka *Sentinel*, May 27: Dick Berryman and a party of miners have taken a lease of one of the principal mines in Page Canyon, Secret Canyon District, and there are a number of other miners talking of taking chances in that locality, where the formation is favorable for working, and rich ore has been found in very good sized deposits.

Star District.

OPENING OF AN ANTIMONY MINE.—*Silver State*, May 30: 'Squire J. M. Brown, of Unionville, has leased an antimony mine in Star District, and let a contract to run 150 feet of tunnel to open it He has had considerable experience in working antimony mines, and is confident of finding a large body of ore in Star, though he will have to spend considerable money in getting the mine in working condition.

Washington District.

AT WORK.—Belmont *Courier*, May 25: Uncle Billy Koch is hard at work running the tunnel in his mine at San Juan, Washington district. He has cut through two ledges that carry ore of low grade. He expects to tap the main ledge in a few weeks with hope that the ore will prove of a better quality. In the early days of Nye county considerable work was done in Washington district, but the ore proving of a rebellious character the mines were abandoned and until a few years back have attracted no attention. There is one patented mine in this district—the St. Helena—that shows a big ledge of this rebellious ore. Experts think that with the improved reduction facilities of the present time the ores of this district ought to be profitably worked.

Willow Creek District.

COMING TO THE FRONT.—Cor. Eureka *Sentinel*, May 26: Willow creek is steadily coming to the front as a mining camp. Reports of new and important developments in many of the claims are coming in daily. The prospectors seem to have wakened from their long winter sleep, and all over the hills the clang of the pick and the shock of giant powder may be heard. The Ohio mine is making regular shipments of its high grade ore to Salt Lake, while the second-class ore is being stored in the mine and on the dumps, awaiting the time when reduction works may be erected by the company. About 20 men are employed at the mine. The Wild Deer mine is looking better than ever. Ore is being stoped out from the 100-foot level to the surface. In some places the pay streak is three feet in thickness. Fine specimens of horn silver and ruby silver have been taken out lately, some of them assaying as high as $3,500 in silver, while assays of from $50 to $250 in gold are not uncommon. A contract has just been let for a tunnel to connect with the 100-foot level, which, when finished, will greatly facilitate the extraction of ore, and will open up 150 feet more of stoping ground. The mill, under the guidance of Bill Long, is doing splendid work, turning out bullion .885 fine, and working the ore to over 80 per cent of the assay value. This may be interesting news to some of the cranks who have formerly had charge of the mill, and who pronounced the ore rebellious. When ore has 10 per cent of sulphurets and is handled with 90 per cent of ignorance and incompetency, it does make pretty rebellious ore. Mr. Long also saves 90 per cent of the gold in the rock, and the two bars of bullion shipped to-day are richer in the metal than any ever produced in this camp.

ARIZONA.

RICH STRIKE.—Arizona *Miner*, May 22: We were shown a couple of sacks of very rich carbonates of copper ore, carrying free gold in abundance, by Mr. Tighe to-day. The ledge was a blind one, and no doubt was run over dozens of times by prospectors. Mr. Tighe says he has known of this ledge for over a year, and came back here from California to record and develop it. This new bonanza is situated at the head of Lynx creek, where the ledge was uncovered and revealed over 21 feet of solid ore. Mr. Tighe says he has secured a good mill-site in connection with the property. The miners in the vicinity are considerably exercised over this find, and are digging like gophers looking for extensions. This is the second rich find made on Lynx creek in the past three weeks. The Maggie mine on Turkey creek, is being vigorously worked by the lucky owners, Jerry O'Neil and John Martin. They have a shaft down about 60 ft. with 2 levels, including a 20-foot winze. The ore is getting richer as every foot of progress is made. The pay streak runs from 6 to 8 inches in width and will average from 100 to 300 ounces per ton of silver. The ore is galena, carrying chloride of silver. They shipped three tons of ore to Pueblo, Col., for reduction, through the Bank of Prescott. These boys have worked hard and stuck by their claim for the past year, and we hope they may reap a rich harvest from their perseverance. Mr. McDonald was in town yesterday and informed us that he and his partner, Nelse Gabriel, had struck it rich at the bottom of their 60-foot shaft, on the Mark Twain mine. They have about 6 inches of $900 ore. They will put on a couple of men immediately and will commence taking out ore for shipment. We hope soon to hear of lively times in the Dosoris camp. We hear that the Milligan mine on Lynx creek is showing up finely. Mr. Milligan, the owner, has a shaft down about 100 ft, and is taking out some rich gold ore, which he intends having worked. This is considered to be one of the first class gold properties of Yavapai county.

COLORADO.

IDAHO SPRINGS.—*News*, May 26: Prospecting is quite lively on the Ute and Cascade creeks. Wagon load upon wagon load of brick is passing through town daily for the new business blocks and smelter. Shipments of ore were made this week to the Idaho Concentrating and Sampling Co.'s works from prominent properties on Ute creek. Work upon the Osbiston smelter goes along steadily. It is beginning to assume huge proportions, and it will not be long before it will be throwing out sulphurous fumes. The Idaho Concentrating and Sampling Co., a new company recently organized, have leased the Mott works, and will carry on a concentrating and ore purchasing business. Marion Whitney is working on the German, and manages to take out enough to keep sugar in the cupboard. At one time, a few years ago, Whitney took out of the German over $8,000 in a few weeks. We understand that the Cascade M. and D. Co. is contemplating resuming operations in Cascade District. This company has a group of valuable patented properties on the Cascade slope, which will probably soon be actively worked. Scaton Mountain is alive with miners. We are sorry to note that the Foxhall Tunnel Company have suspended operations. They, like most of the people who run tunnels, stop where they should begin—or, perhaps there is a small game of freeze-out being carried on. The Lilly Co.'s stamp-mill is pounding away day and night on ore from the mine. The mill, under the management of Alex. Taylor, has been repaired and put in first-class order. Two half-cord wagons, with four mules each, are hauling the ore from the mine. More miners will be put on as soon as the platforms are partially cleared of ore. South of the Champion is the once famous Specie Payment, lying idle, with the engine and works going to ruin. This mine has produced richer gold ore than any mine ever discovered in the State. The present depth of the property is not quite 300 feet, but bad management got it into trouble, and we suppose it will lay idle until some one will purchase it from the present owners and start it up.

NOTES.—Colorado *Miner*, May 23: Byers & Co., lessees on the east drift of Victoria tunnel level, intend shipping about 20 tons of ore the last of the month. A mill-run this week from the Swamp Angel lode, in Chase gulch, worked under ease by Rockwell & Co., gave 219 ounces silver to the ton. A mill-run brought down from the Fred Rogers lode, on Democrat mountain, by A. McNulty, the first of the week, gave 436 ounces silver to the ton. Beck & Twibell, lessees on the Mendota mine, on Sherman mountain, shipped a carload of ore, containing 18 tons, from their workings, on Thursday, to Golden. Byers & Co., lessees on the Telephone lode, on Brown mountain, brought down a run a few days ago, which gave 177 and 67 ounces silver to the ton, according to class. The Joe Reynolds lodes, on Silver creek, are all looking splendidly, and the different lessees are taking out large quantities of good ore. Silver creek, for its size, has no equal in the mountains. Barney O'Connell & Co., lessees on the Nyanza lode, on Democrat mountain, have exposed a vein of solid ore two inches thick, and a mineralized quartz streak 12 inches thick. The last mill-run from these workings gave 277 and 63 ounces silver to the ton, according to class. Byers & Co., lessees on the Telephone lode, Sherman mountain, are stoping on a vein of sulphuret ore, ranging from one to four inches in thickness. Mr. Byers informs the *Miner* that there is ore exposed in nine different parts of the workings, ranging from one-half to two inches in thickness. Daily district will be the scene of a great deal of activity this summer. Quite a number of claims that were worked under assessment last year, showed up finely. One claim, upon which the assessment was done, the owners realized $1,400. Messrs. Julian Stanton, Armstrong Shepard, Rob't. Mattern and others, have all good claims, which they propose working this summer. Ballard and Sol Robinson have also some good claims in the district, which they intend working this season.

IDAHO.

TO BE LEASED.—Wood River *Times*, 27: M. T. Richardson, owner of the Red Elephant group of mines near Bullion, is in town to-day. He reports the Red Elephant a second Jumbo, and looking better than ever before. The ore increases in extent as he sinks upon the vein, though it does not seem to increase much in richness. As his health will not permit his continued residence in that section, Mr. Richardson will put leases on his mine and slide down to where the air is more moist and heavy. Two leases have already been let, with one or two more to follow soon.

PLACERS.—Idaho *World*, May 22: K. P. Plowman made a clean-up last Saturday in his placer claim on East Hill, after a run of 30 days. The amalgam weighed 52 pounds, so the clean-up will go about $7,000. Last year Mr. Plowman commenced work on May 23d, and this year made his first clean-up on the 23d of May. Plowman owns all of East Hill, and has ground enough to keep his two hydraulic chiefs going every season for 20 years, and the ground is all good. He has a big fortune in that hill. Mr. Plowman has been a go-ahead miner and plucky, but very unlucky in this camp in his mining ventures for over 20 years, but kept on driving ahead against the breakers.

AT SAWTOOTH AND VIENNA.—Col. Brodhead was in town to-day from the upper country, having come to appear before the grand jury as a witness. He reports the road between Ketchum and Sawtooth in such good condition that he traveled it in seven hours, the other day, with his own team. Another ore-body which promises to be more extensive and richer than any yet found in the mine, was discovered in the Vienna a few days ago. The mill of the Colman (Vienna) Mining Company will start up to-morrow, with a supply of ore ahead ample for the season. The remainder of the machinery for the Silver King concentrator left Ketchum this morning. The works will probably be started up in two weeks, and make shipments of ore to Wood River regularly thereafter, if successful they will prove a great help to the upper country, as it is stated that there are over 2,000 tons of ore on the dumps ready for concentration, that cannot be marketed. Col. Brodhead will begin sending ore to the concentrator as soon as it shall be ready to receive it.

MONTANA.

MILL.—Helena *Independent*, May 30: Messrs. Brooke, Elge and Wormer have purchased a 10-stamp gold quartz mill for the purpose of working the quartz from their valuable gold leads, the "Parker" and "Griff," near Bald Butte. Upon the Parker and Griff mines there have been five shafts of 100 feet each sunk, that shows them to be immensely rich lodes, every shaft shows from 1 to 15 inches of ore that will go from $5,000 to $9,000 per ton, and four feet that will average over $40 per ton. The owners have leased the property to parties who are under bond to give them 15 per cent of the gross proceeds for the privilege of working it. That these mines will prove bonanzas to their owners no one doubts. Good news has reached the city from the Elkhorn mine, in Jefferson county. In the 500-foot level, some marvelously rich ore has been struck, "richer than ever." "There isn't money enough in Montana to buy her," said one of the owners to an *Independent* reporter yesterday. This mine has already made its owners worth several thousands of dollars and its present outlook promises that they will all be millionaires. From a prominent merchant of our city and one of the owners of the Helena lode, who took a trip out there yesterday, we learn that on the Helena lode they have struck it richer than ever, that plenty of ore is being taken out and sorted for shipment, and that from ores that have already been shipped handsome returns have been received. It is said that other mines in the same vicinity are being extensively worked, and the owners of all of them are in high spirits over their prospects. The Helena mining and reduction works are doing an immense amount of work this month, and the indications are that the returns at the end of the month will show up larger than ever before. The new Gregory shaft is now down 135 feet. It is expected that it will reach 600 feet in a very short time, as work is being pushed with surprising rapidity. The Drum Lummon is booming, and it is estimated by prominent mining men that the output for May will run over $100,000, an increase over April of nearly $15,000. Reports from mines in every direction are good.

BUTTE.—*Miner*, May 27: All the mines, mills and smelters in the camp are bowling along in good shape and the output is as great if not greater than ever before. A short tour yesterday showed that at all points work was being pushed and additions made in many of the mines, and the indications are the supply will be largely increased. The Alice is reported as doing better than ever before, the yield being 60 tons per day. The increased yield is cross-cuts and levels to the depth of 60 feet. The caused by the development of the old stopes and veins on the north vein and by new discoveries in the south vein, which has been opened by series of main shaft has been sunk to the depth of 800 feet and a cross-cut north is contemplated. This cross-cut will open new ground, as it will be 200 feet further east and 20 feet deeper than the cross-cut run from the bottom of the winze from the 700-foot level. The Springfield people report a rich strike. New machinery has been placed in position. The pay streak is now 15 inches wide, and a large block taken out yesterday assays $568. It is free-milling ore, and the vein will undoubtedly average $250 by bucket sample. The Moulton is being pushed for all it is worth in the 300, 400 and 500-foot levels. The north vein of the 500-foot level is being developed, and the showing is very good. The wood flume of this mine has just been rebuilt and is now floating 150 cords per day. The Montana Copper Company are rustling along as usual and working without intermission. The Colusa is still producing its splendid grade of ore, and the West Colusa is being developed by sinking a 300-foot level, and expects in a few weeks to reach the desired depth. The Parrot Company are working over 300 men in the mines and smelter and are drifting considerably, but at present are not sinking. The ore body is excellent and the capacity of the smelter is taxed to treat the ore. At the Patsy Clark group, extensive preparations are being made for work, including new buildings, furnaces and other necessary paraphenalia. At the Georgetown a fine vein has been struck which assays very highly. The Valdimar is being worked at the east end of the north vein and a fine ore showing $90 to the ton is being taken out. Large quantities are being taken out and shipped to the Alice mill for treatment. The Orphan Girl is being worked to the extent of about 90 tons daily, of low grade free-milling ore, from the 40-foot level. The Dexter is doing the milling at the rate of 28 tons daily. The Lexington, which is now down to 650 feet, have been arranged to sink an 800-foot level. A pair of new boilers and other additions will be placed in position within a week or two. The Gagnon is only working in the 400-foot west level, and taking from the faces and stopes 25 tons of ore daily. The Silver Bow is treating about 30 tons daily from the LaPlatte mine, of excellent grade, which is about all it can manage.

NEW MEXICO.

GOLD HILL.—Cor. Silver City *Enterprise*, May 29: Col. Bob. Howland, of San Francisco, an old-timer in this section of the country, expects in a very few days to commence operations in our camp. He has viewed several of our gold claims, and so far as his observations extended he is very favorably impressed. In all probability he will take the Homestead, the property of McCone, Keister and Hargrave, should he be able to secure a bond in the absence of one of the partners. This claim being favorably situated and easy of access, is among the first mines on the gold belt to attract attention. The bonanza claims continue to hold out, much to the satisfaction of their owners. Lone Hand and Old Georgia still produce horn silver and sulphides in abundance. They are now down 25 feet and 18 feet, respectively, and the ore if possible, is richer now than at any period of development. Twelve inches is the average size of the pay streak, which will easily work $600 per ton by mill process. Work on the Grand Tower has been resumed with flattering results. Northern Belle continues to pan out satisfactory. A lot of ore now out is awaiting shipment. Work will shortly be resumed on the Treasure Box. Reservation is now idle, but work will be resumed in a few weeks. Bargy, B. & S. and Cold Spriog are looking as well as ever. The Chapo on the north side of the range, is in statu quo, the owners, Shedman and Wines, having concluded to let it rest a while—at least until the Indian troubles are better understood. This no doubt is a wise move on their part, as the claim is situated directly on the Apache trail. A fair average test recently taken from across the ledge gave returns of 83 ounces per ton in silver. Assessment work has just been completed on one of Lucas & LeDoux's claims on Gold Hill, which promises fairly. The vein is six inches in width, and shows up good ore. No test has yet been made. Barney Cox, George Black and Charley Stone are millionaires in prospective, having located a big thing which all the time has been laying out of doors in plain view of the camp. The Setting Hen, the name by which the boys expect to acquire wealth and fame, is now on the nest; the chickens are being counted daily.

UTAH.

THE CHRISTY COMPANY.—Southern Utah *Times*, May 25: The mill worked 280 tons of ore last week, which will average about $25 per ton. At the California, drifting continues on the fourth level south, and considerable quantities of very good ore is being extracted from this portion of the mine. The ore bodies hold out good on the third and fifth levels. There were 35 tons of ore shipped daily from the mine last week. For several days past there have been rumors floating about the camp of a big strike having been made in the new shaft. Last Monday we paid a visit to the mine, and through the kindness of Mr. Al. Grant, foreman, we were able to make a personal examination of the new find. It will be remembered that under Captain Lubbock's management the old company were taking out of the Tecumseh and Stormy King immense quantities of high grade ore, when a break in the country rock was encountered which completely cut off the ledge. This break occurred about 125 feet from the surface, and, notwithstanding the fact that a great amount of prospecting had been done, the ledge was never recovered by the old company. When the new company began operations, prospecting for the lost ledge was resumed; and while several rich pockets of ore were struck and parts of the vein met with in broken ground, at different times, the ledge was not found in place until this present strike was made. The point where the ledge was rediscovered is about 420 feet north of the new shaft on the Stormy King ground, 140 feet below the break. A drift is run in on the ore a distance of 50 feet, where a winze is being sunk on the ledge which is now down to a depth of over 40 feet, exposing three and one-half feet of high grade ore. The ground is firm, the walls perfect and the pitch of the vein to the west conforms to the strata of rock in the Buckeye and White Reefs. This is the most important strike that the Christy Company has made since resuming operations, as it demonstrates the fact that the Tecumseh and Stormy King are mines more valuable than when they were the leading producers of the camp.

REVIEW.—Salt Lake *Tribune*, May 29: The week has been generally clear, but rather cold for the season. The movements of the metals have been fair. The shipments out from this city for the week ending Saturday, May 23d, inclusive, were 1,272,682 pounds. The receipts in this city for the week ending May 27th, inclusive, were $76,482.88 of bullion, and $9,636.07 of ore; a total of $86,118.95. The week previous the aggregate receipts were $75,591.27, of which $61,481.27 was bullion, and $14,110.00 was ore. The Ontario has resumed shipments, after the annual clean-up and overhauling of the mill. The first of the new run was reported on the 26th—of 38 bars, valued at $23,264.54, bringing the total product of the year up to $645,980.08. There is nothing yet to report from the Horn Silver, locally. The silver sandstones yielded during the week four bars of the white metal, of which the Stormont sent up two silver bars, valued at $3,450, and the Christy two silver bars, $3,100. Stormont stock sold during the week in New York at 9 to 11c. Riter bullion, from Tintic, is another pleasant feature during the week; 10 bars of it were received, valued at $5,600. The product of the Hanauer smelter for the week was nine cars of bullion, $22,750. The Germania produced during the week seven cars of bullion, $18,318.34.

CHLORIDING.—There are 30 chloriders at work on Tecumseh Hill. The hill with its multitudinous prospect holes, resemble an immense honey-comb, and one unacquainted with the country would suppose that all the ore near the surface was gouged out long ago. Yet, some of the boys are making good wages, and all seem contented. Every now and then a rich bug-hole is struck which maketh the heart of the finder glad, and encourages others to persevere in their search for rich pockets.

THE STORMONT COMPANY.—The stopes look well and the usual number of miners are engaged in working the mines. An average of 37 tons of ore per day was shipped from the company's mines to the river mill during last week, giving a result of $3,760 worth of bullion.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. I OHSE, SEC'Y.

Office, No. 230 California Street, - - - - San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengthe as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro Glycerine. and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Shasta County Districts.

[From our Traveling Representative.]

Flat Creek District.

This district lies on the west slope of the ridge of mountains extending along the right bank of the South Fork and main branch of Squaw Creek and takes in a greater portion of the country between Squaw Creek and the Sacramento River. Comparatively speaking, the district is not only new but undeveloped as well. The mineral bearing formations carry gold, copper and silver, the latter, however, predominating. As yet the field is prospected but little, and were such a showing as exists here to be made in Arizona or New Mexico there would be a boom in mining that would turn the hills inside out. The leading prospects of the district are owned by Redding people who are well-to-do and able to hold their mines until they get ready to sell. The owners are progressive business men and while they may hold out for a big figure for the group an investigation of the mines justify their so doing.

The Windy Camp Group.

Eight locations consist of the above group. The claims are continuous and cover a distance of over 10,000 feet in length and 600 feet in width. Commencing on the northwest end 700 feet above Squaw Creek is the Balaklala, followed southwesterly by the other claims as follows: El Monte, Fortune, Mule, Huckleberry, Windy Camp, Yellow Jacket, and Coldwater. These locations cover a mineral belt that varies from 40 to 600 feet in width and occurs between granite and porphyry formations coursing NE and SW. The belt thus located is well defined and wherever developed shows satisfactory results in quantity and quality of ore exposed. The ore carries gold, copper and silver, the latter predominating.

A Phenomenal Property.

A full and correct description of this group of mines would read too flattering to find endorsement from any save those who had visited and inspected the property. As a lasting and steady paying proposition the locations are without an equal. As a high grade bonanza it is a failure. Capital in search of mines that have ore in quantity; easy of access, cheap to mine and not difficult to treat could not do better than with such a property. The vein matter, if veiu it can be called, is a mixture of mineralized porphyry, silica, iron-gossan and a reddish sedimentary formation of the character of oxide of iron. Deposits of sulphide and native silver, gold and copper are the principal products; silver predominating to about 70 per cent., gold and copper the remainder. Occasional deposits of sulphurets occur throughout the mineral belt. The cropping over the entire claims is largely iron-gossan which runs well in sulphides and occasional native silver deposits. The great beds of this iron resemble in appearance those of the famous Sierra Grande mines of Lake Valley, New Mexico. The magnitude of the ore bodies of the Windy Camp group places it in the lead of the Sierra Grande and its advantageous surroundings make the mining and milling of its ores easier and by far more profitable. A mineral belt extending over 10,000 ft in length and averaging nearly 200 in width (no telling how deep, only 120 feet having been made in depth) the ore running on an average of $40 per ton is a fair statement of the extent of the ore body of this property.

Development Work.

Assessment work is all the development done on the group, with the exceptions of the Balaklala, Windy Camp, Huckleberry and the Mule, on which claims considerable work has been done. The principal development has been done on the Balaklala, on ths northeast end of the group, the Windy Camp near the southwest end, and the Huckleberry and Mule near the center, thus prospecting the group as one great mine. Near the north end of the Windy Camp a southeast tunnel, 110 feet on the hanging, has been driven in the ore ground and at its breast taps the ore 120 feet below the surface. At 70 feet from the tunuel's mouth a cross-cut 50 feet southwest and a 30-foot drift across the ore body to the foot-wall, showing the width of the ore body to he about 80 feet. A drift 50 feet along the foot-wall shows a continuation of the same pay streak. This work shows ore 120 feet deep, by 60 feet wide and 110 feet long, and no dead work done in opening the mine, as the development was all done in ore. Two parallel tunnels have been run in on the Huckleberry, some 200 feet apart. The showing is a black iron-gossan. The oxides and carbonates have given room to sulphurets of copper to a distance of 60 feet in from the surface. This will run from 7 to 30 per cent copper and run low in gold and silver. This claim appears to carry most of the copper of the group. The adjoining claim, the Mule, is the same as the Windy Camp, showiug very little copper. The Balaklala, on the northeast end of the group, is the best prospect. Three open cuts, one of 12 feet and two of 80, and a 24 foot shaft is all the work done on this mine. All of the work is in and on ore. Great croppings resembling ore piles cover the claim like a great iron quarry. The vein matter or ore body here is nearly 600 feet wide and carries sulphide, native silver, gold and some deposits of sulphurets. The ore is a high grade and is easily and cheaply extracted. The cost of mining and milling would be less than $5 per ton.

The Advantages.

Timber is abundant. Water is plenty and near by. A good wagon road can he built to the Sacramento River, along which the railroad runs, for less than $3,000; the distance hsing about three miles. Battery and plate amalgamation, concentration and a reduction of the concentrates would be a cheap and successful treatment of the ores. An inexhaustible supply of ore—and they have it here, is the main and necessary feature of a paying miuing and milling proposition. There are over 1,000 tons of ore on the dumps now awaiting treatment that will average over $30 per tou.

Business Men as Miners.

Business men as snccessful miners are few and far between. Large bodies, it is said, move slowly. The same can be said in regard to the development of a large mine. The owners of this group are already engaged in business, hence their capital is more or less tied up. Such a state of affairs is deplorable. If a mining man or men with capital and experience owned this group of mines and worked it for what it is worth it would make Shasta county's mineral resources notorious. Messrs. Weil, Willard, Conroy, Ellis, Murry Shay and a few other Redding men own the Windy Camp group, and while they do not "have to" sell it is hoped that in the interest of progressive mining and Shasta county's future as a bullion producer that some mining people will get hold of this property.

"The T. Shasta Bar."

A number of Red Bluff capitalists are pushing the work of changiug the course of the Sacramento river at a point 28 miles north of Redding. The scheme is a novel and feasible one and will, if carried out, prove a paying investment. A tunnel six feet square is being driven through the mountain a distance of 400 feet, 100 feet of which is already finished. By this tunnel the river bed will be bared a distance of two miles. The hill system above and along the side of the hed-rock about to be drained has paid hig. The river bed is a vertical slate one peculiarly adapted to holding any mineral that may have been deposited thereon. The 300 feet of tunnel yet to be driven is in a hard granite. A contract has been made for the completion of the work at $8 per foot; the tunnel to be through hy September 1st. Two miles of bed rock gravel will be exposed by this tunnel and the richness of the river above, the hills overhanging and the gold catching formations of the river-bed justify the expectations of a future bonanza hoped for by the projectors. There is a tendency among the shareholders to buy back what stock has been sold at as early a day as possible—stock having been sold for working purposes. If more should be sold to complete the tunnel it will be a limited amount and the chances are that the management will try and scoop it in again as soon as possible. C. R. Mayhew, a leading merchant, John F. Ellison, a prominent attorney, Drs. West and Westlake, John Wilson and Arthur Chittenden, all of Red Bluff, Tchama county, are the leading spirits and they go at the work in a practical, miner-like manner that deserves success. This tunnel is alongside of Tunnel 5 of the Central Pacific Railroad above Flat Creek District.

Backbone District.

Almost directly opposite Flat Creek District, on the left bank of the North Fork and the main branch of Squaw Creek, is Back-Bone Gold District. The entire district is a stratified belt of gold quartz veins carrying free gold, some of which runs very high. The formations are a quartzose porphyry. The district was gobbled up by a few men, and consequently but little work has been done in the way of development. Assays as high as $404 have been made. W. T. Coleman, of San Francisco, who has large interests in French Gulch and Deadwood, visited this district last week, and is reported as having purchased the J. W. Conant group of five mines, opposits the Windy Camp property. If such is the case, the speedy development of the district's resources can be looked for at an early day. Coleman has been instrumental in doing excellent work in this county, both for Coleman and the mining interests.

The Whittman and Small locations, adjoining the Conant group, are being developed, under a hond for $10,000, by Durhy Bros., of Oakland. The work, so far, has been highly satisfactory to the par ies interested. The mines of this district carry a great deal of sulphurets. The future of Back-Bone district is one of bright promise.

"Float."

Conroy's depot hotel is the mining exchange of the North.

Business men and professionals of Redding deal in mines.

Redding people talk mines and mining like well-versed me allurgists.

The Shasta county *Democrat* makes a specialty of mining news.

New-comers in search of mining property arrive in Shasta on every day's train.

A boom in milling interests is destined to follow up the prosperous condition of Shasta's mines.

J. N. Majors an old timer now a leading livery man is largely interested in Shasta county mines.

McCormack, Saeltzer & Co., one of Redding's leading business houses, have a branch house at Delta and carry a stock of $75,000.

Regular shipments of ore to Denver smelters are made from Redding; freight and treatment costing $50 per ton.

Copper City is enjoying a healthy boom and the plant now at work handles the ores successfully and profitably.

B. Conroy, mine host of the Redding Hotel, is a full fledged mining expert as well as a proverbially hospitable landlord.

Copley station is the shipping point for the Flat Creek and Backbone district mines; the fare from Redding to Copley is 60 cents.

The advertising Shasta is getting by her good mines is resulting in an increase of her population and an era of prosperity and plenty.

Miners in search of work by the day cannot find employment in any numbers in the districts described in this letter for some time to come.

B. B. Minor an experienced mining man is sojourning at Copley looking up good properties for himself and other capitalists. Mr. M. is considered authority on mining matters in that district.

F. W. S.

Mining Share Market.

Matters are quiet in the stock market, very little activity being apparent. Meantime, the never-ceasing, usual course of development goes right straight along in the principal points of the old Comstock lode, throughout its length of two miles, more or less, and the hopes of the situation are simply based upon actual developments at different points. The most interesting of all these has been the very encouraging prospect found in Hale & Norcross, on the 2,900 and 3,000 levels of that mine. A very acceptable quantity of excellent ore was developed, but not enough to justify extraction and milling at present. What more is to be developed at that particular point, the future alone can tell, but enough is already developed to show that a fine ore body exists in the 2,900 and 3,000 levels of the mine. It cannot be called a bonanza, but it is a first-class prospect for one. The flood which prevaded the mine for the last three or four weeks did considerable damage, giving a large amount of work in the way of cleaning out and repairing of drifts and timbering, and now the work has but just caught up to the point where it left off when the flood from the pump stopped operations.

The low grade bonanzas at both ends of the lode, in Consolidated California add Virginia and in Yellow Jacket, Crown Point and Belcher, are turning out their usual supply, with no sign of diminution, but rather of increase.

Bullion Shipments.

Silver Wave, May 27, $2,752; Richmond Con., May 26, $16,000; Christy, May 26, $1,400; Germania, May 26, $4,408; Hanauer, May 26, $2,650; Ontario, May 27, $23,264; Germania, May 27, $4,867; Hanauer, May 27, $7,450; Stormont, May 28, $3,450; Crescent, May 29, $1,800; Hanauer, May 28, $2,400; Germania, May 28, $5,000; Crescent, May 29, $2,600; Hanauer, May 29, $2,200; Germania, May 29, $5,319; Christy, May 29, $1,400; Orlano, May 29, $26,725; Hanauer, May 30, $4,400; Queen of the Hills, May 30, $1,400.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if t is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MINING SHAREHOLDERS' DIRECTORY.

Our Agents.

OUR FRIENDS can do much in ald of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—San Louis Obispo and Santa Barbara Co.
G. W. INGALLS—Arizona.
M. S. PRIME—Alameda County.
MRS. OZIER—California.
E. L. RICHARDS—San Diego Co.
F. W. SMITH—Tehama, Shasta and Trinity Co.
W. B. TURNER—California.
L. J. SAFLEY—Alameda Co.
GEO. MCDOWELL—Fresno Co.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its colnmns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its valumore widely known to othsrs, and extending its influence in ths cause it faithfully serves. Snbscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at timss), by turning a leaf.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING MAY 26, 1885.

318,531.—WHIP SOCKET—C. L. Bird, San Buenaventura, Cal.

318,859.—DREDGING MACHINE—A. B. Bowers, S. F.

318,860.—DREDGING—A. B. Bowers, S. F.

318,596.—RABBETING CUTTER HEAD—P. A. Buel, Stockton, Cal.

318,544.—HORSE COLLAR—Wm. Cosbie, S. F.

318,454.—STICK CANDY MACHINE—J. J. Cousins, S. F.

318,890.—SASH PULLEY—J. D. Fyke, Los Angeles, Cal.

318,903.—SHANK STIFFENER FOR BOOTS, ETC.—A. Hummer, S. F.

318,623.—CONCRETE TUBE FOR CABLE R. R.—J. D. Isaacs, Oakland, Cal.

318,747.—WEDGE CUTTER—J. T. Jenkins, Clements, Cal.

318,563.—VINEYARD GANG-PLOW—R. B. Johnson, Fresno, Cal.

318,483.—FRUIT JAR—S. L. Loomis, Wright's Station, Cal.

318,572.—TRACE BUCKLE—O. Mallory, Auburn, Cal.

318,644.—HAY PRESS—S. H. Miller, Sacramento, Cal.

318,538.—STORM SHIELD AND OVERDRESS—Maggie Boyd, Riverside, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HORSE COLLAR.—Wm. Cosbie, S. F., No. 318,544, dated May 26, 1885. The invention consists in an improved metallic tuhuler throat-piece, the novelty of which lies in an elougated slot at the back crossed by ties near each end, whereby the piece is readily fitted to the rim. The edges or lips of the rim, together with the fly to which the belly is attached, project through the slot, and the tuhular piece is firmly held to place by the cross-ties. This tuhuler throat-piece is readily applied, and braces or shapes end strengthens the rim not only during the process of stuffing, but afterwards when in use.

COMBINED STORM SHIELD AND OVER DRESS.—Maggie Boyd, Riverside. No. 318,538. Dated May 26, 1885. This is a storm-shield, head umbrella and skirt protector adapted for ladies' use. It consists of a waist or body piece that shields the front and upper portion of the body, an umbrella shaped head piece, attached to or connected with said waist, and a skirt having a protecting fold or flap extending from the lower rear edge, so that it may be used to encase and protect the skirts of the wearer. The shoulder attachment may be raised or lowered to suit the position of the head-piece. The skirt portion drops over the ordinary clothing. The garment entirely encases the wearer and protects her from wind and rain.

VINEYARD GANG-PLOW.—Rasmus B. Johnson, Fresno. No. 318,563. Dated May 26, 1885. The invention consists in a simple and light frame of har iron carrying a plow on each side and hrought to a longitudinal center forward, where the clevis is attached, and in a single guiding, and adjusting wheel located centrally nnder the front of the frame and adapted to he adjusted hy a peculiar crank and lever. The object is to provide a light gang plow having a center draft and adapted to he easily halanced on a single wheel. The usual gang-plows have two wheels and their frames are not so constructed that a perfect center draft can be obtained; and this inventor claims that with the single wheel located under the front center of e properly centered frame he is enahled to properly construct a light and easily handled plow.

MAKING TULE BUNCHES FOR LIFE-PRESERVERS.—Constant Leduc, Stockton. No. 317,559. Dated May 12, 1885. This is a machine for making the hunches of tule-grass to he used in the formation of life-preservers. Mr. Leduc has already a patent on making life-preservers from the ordinary tule or rush that grows so plentifully in this State. The life-preserver is made up of a number of hunches of the dried stalks or stems of the tnle, end each hunch consists of a suitahle number of stems properly tied. The object of the present invention or machine is to make these hunches, and the invention consists in hed or die strips upon which the stems are laid in reciprocating or vertically moving presser-strips s dapted to he forced down upon the stems to press them into a bunch hetween themselves and the die-strips, and in swinging knives snitably arranged to cut the end of the hunch so that all the stems forming it are made of equal length. The invention further consists in the mechanism hy which the necessary movements are effected.

ADDRESS all correspondence to the name of the paper or firm, as either of the publishers or editors connected with the office are quite likely to be absent at times.

Satisfactory, Etc.

NOGALES, A. T., May 27, 1885.

MESSRS. DEWEY & CO., *Gents*:—Yours of the 18th of May enclosing notice of allowance of my application for a patent for "Process of Treatment of Nickel and Cobalt Ores," was duly received. It is extremely satisfactory, and I must say I am surprised at the rapidity with which you have accomplished a result which I expected would have taken six months or a year to reach.

Yours, very respectfully, C. H. AARON.

HELD FOR POSTAGE.—We repeatedly receive letters with the above stamped on them, showing that enterprising parties oftentimes forgot to put stamps on their letters. This may account occasionally, for the non-receipt of letters alleged to be sent to us.

HEREAFTER I shall confirm prices with the lowest in this market. C. Muller, optician, 135 Montgomery street, near Bush.

NOTICE TO ARCHITECTS.

$250 for Plans.

THE DIRECTORS OF THE INSANE ASYLUM OF Arizona propose to erect an asylum of sufficient size and capacity to accommodate 100 patients, near the City of Phœnix, in Maricopa county, Arizona Territory, and for the purpose of obtaining plans and specifications suitable for such an institution, hereby make the following offer to Architects, namely:

FIRST. The Directors will receive plans and specifications offered by Architects, and place on file with their Secretary, N. A. Morford, at Phœnix, Arizona, on or before the 3d day of July, 1885.

SECOND. On said day, or as soon thereafter as practicable, the Directors will examine all the plans and specifications offered, and if any one of them shall be approved by the Directors and adopted for the construction of said asylum, they will pay to the party offering the same, two hundred and fifty dollars; but the Directors reserve the right to reject all plans and specifications offered.

THIRD. The material to be used in the construction of the buildings will be brick, iron, and wood, unless some different material shall be found which is more desirable and which can be supplied for an equal cost.

FOURTH. The cost of the whole construction must not exceed $45,000.

FIFTH. The buildings must be complete in themselves, but so arranged that their capacity may be largely increased with facility by additions without changing or removing the structure.

SIXTH. The prices of material and labor at the site of the building will be approximately as follows, viz.:

Lumber per M., finishing and flooring	$65 00
Lumber per M., rough	45 00
Brick laid in wall, per M	14 00
Rockwork for basement, per perch	3 50
Iron, per lb	4c
Lime, per 1,000 lbs	2 00
WAGES. Carpenters, per day	4 00
Bricklayers, per day	5 00
Laborers, per day	2 00
Painter, per day	4 00
Plasterer, per day	5 00

SEVENTH. The climate is temperate, but the mercury ranges high during about three months of the year, and then it drops to the freezing point in winter, occasionally, and hence provisions must be made against extremely warm as well as cold weather. The temperature ranges approximately as follows:

	Maximum, Means for 1884.	Minimum, Means for 1884.
January	70.1	31.1
February	70.5	34.5
March	76.1	32.9
April	85.2	40.8
May	93.4	40.1
June	103.4	55.7
July	109.0	64.3
August	104.2	63.2
September	89.0	48.3
October	93.0	51.3
November	83.2	40.1
December	67.8	36.1

All plans and specifications sent by mail or express must be prepaid and marked "Plans and Specifications for an Insane Asylum," and addressed to the Secretary of the Directors of the Insane Asylum, Phœnix, Maricopa County, Arizona.

Plans and Specifications will be returned, if required, on receipt of cost of transportation. N. A. MORFORD, Sec'y Board of Insane Asylum Directors.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

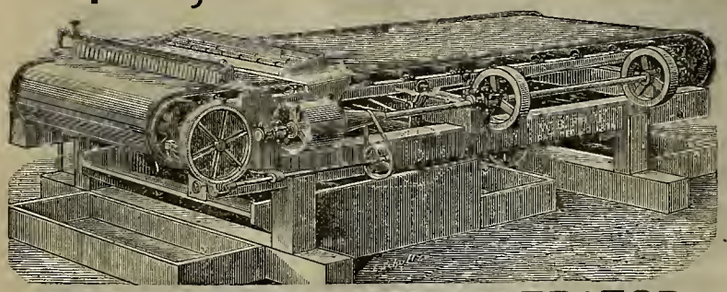
JUSTINIAN CAIRE, Dealer in Mining Material, Agent, 521 and 523 Market St, San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

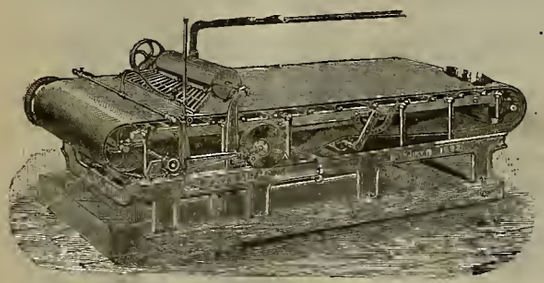
Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street. - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with a curate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000,** flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St., San Francisco, Cal

PACIFIC IRON WORKS

1850. 1885.

RANKIN, BRAYTON & CO.,

....BUILDERS OF....

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

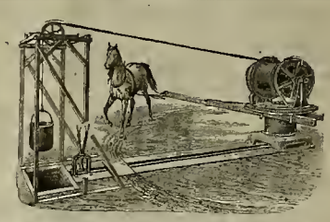
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

HOISTING WORKS

TO FOUNDRY MEN.

One No. 2 Mackenzie Cupola (3 tons).

One No. 3 Mackenzie Blower.

All Complete and Ready to Set Up.

PRICE, $1,100.00.

For Sale by CALIFORNIA WIRE WORKS, 329 Market St., San Francisco.

Send for Catalogue and Prices.

ATLAS ENGINE WORKS

INDIANAPOLIS, IND., U. S. A.

MANUFACTURERS OF

STEAM ENGINES & BOILERS.

Carry Engines and Boilers in Stock for immediate delivery.

H. P. GREGORY & CO. Sole Agents, 12 and 4 California St., S. F., Cal.

THE HOME SCHOOL

FOR YOUNG LADIES—

1825 Telegraph Ave., OAKLAND, CAL.

(Founded in 1872 by the late MISS H. N. FIELD.)

Gives thorough instruction in foundation studies. Admits special students. Prepares for the State University and for any of the Eastern Colleges. The Fourteenth Year will begin on Wednesday, July 29, 1885. Address MISS L. TRACY.

MINING AND SCIENTIFIC PRESS.

Shaft Sinking.

[*Continued from our last.*]

This latter rope, on its way to the gear-wheel, passed over a rolling horizontal drum (P, Fig. 1, and A, Figs. 12, 13, 14), and between two vertical rollers (B, Figs. 12 and 13). The drum could be moved forward by a winch (Q, Fig. 1), and run back by a weight (R, Fig. 1), and the vertical rollers could be moved to right or left by a screw (C, Figs. 12, 13 and 14), and so the point of suspension of the tools could be placed over any part of the floor of the shaft where the drill-pump was to work.

The hoisting frame and machinery were the same that were put in and are now used for ordinary hoisting and pumping, except that for pumping a larger gear-wheel has been put in the place of the one which imparted drill motion to the tools. The winding reel (S, Fig. 1), was operated by friction gear in raising the tools and load, and controlled by break in lowering them.

The tools were let down and the connecting rope attached by the clamp La, Fig. 1, and put into place by moving the drum and rollers; the main rope slackened above the clamp and the machinery started, giving the lift and drop motion to the tools. When the drill-pump was loaded the connecting rope was unclamped from the main rope and disconnected with the driving wheel by slipping the wooden eye from the wrist pin, the drum moved back, the tools raised and the drill-pump emptied.

The drill-pump and its parts are shown at G, Fig. 1, and in Figs. 2, 3 and 4 (in PRESS last week). The whole length of the pump is 7 feet and 7 inches (D, Figs. 2, 3 and 4), which extends 10½ inches above the head. The main barrel, A, Figs. 2, 3, is wrought-iron one-fourth inch thick, with welded vertical seam, is 7 feet 1 inch long, and its inside diameter is 1 foot. The shoe (B, Figs. 2, 3, 4), screws on to the barrel at its lower end. Its cutting edge is formed by a beveled steel ring (Ba, Figs. 2, 3, 4), which is fastened with set screws to the iron of the shoe.

The valve seat (F) is held in place by a projection (Ea, Fig. 3) at its lower edge, placed between the shoe and the lower edge of the main barrel. The head (C, Fig. 3) consists of a wrought-iron plate, three inches thick, held to the barrel by a band (F, Fig. 3) screwed on to it and on the outside of the barrel. The joint was made more firm by shrinking an iron ring (G, Figs. 2, 3, 4) on to the band over the edge of the plate of wrought-iron; and to make the joint more secure, a similar wrought-iron plate should be put into the upper end of the barrel, and a ring shrunk on to the band over its edge.

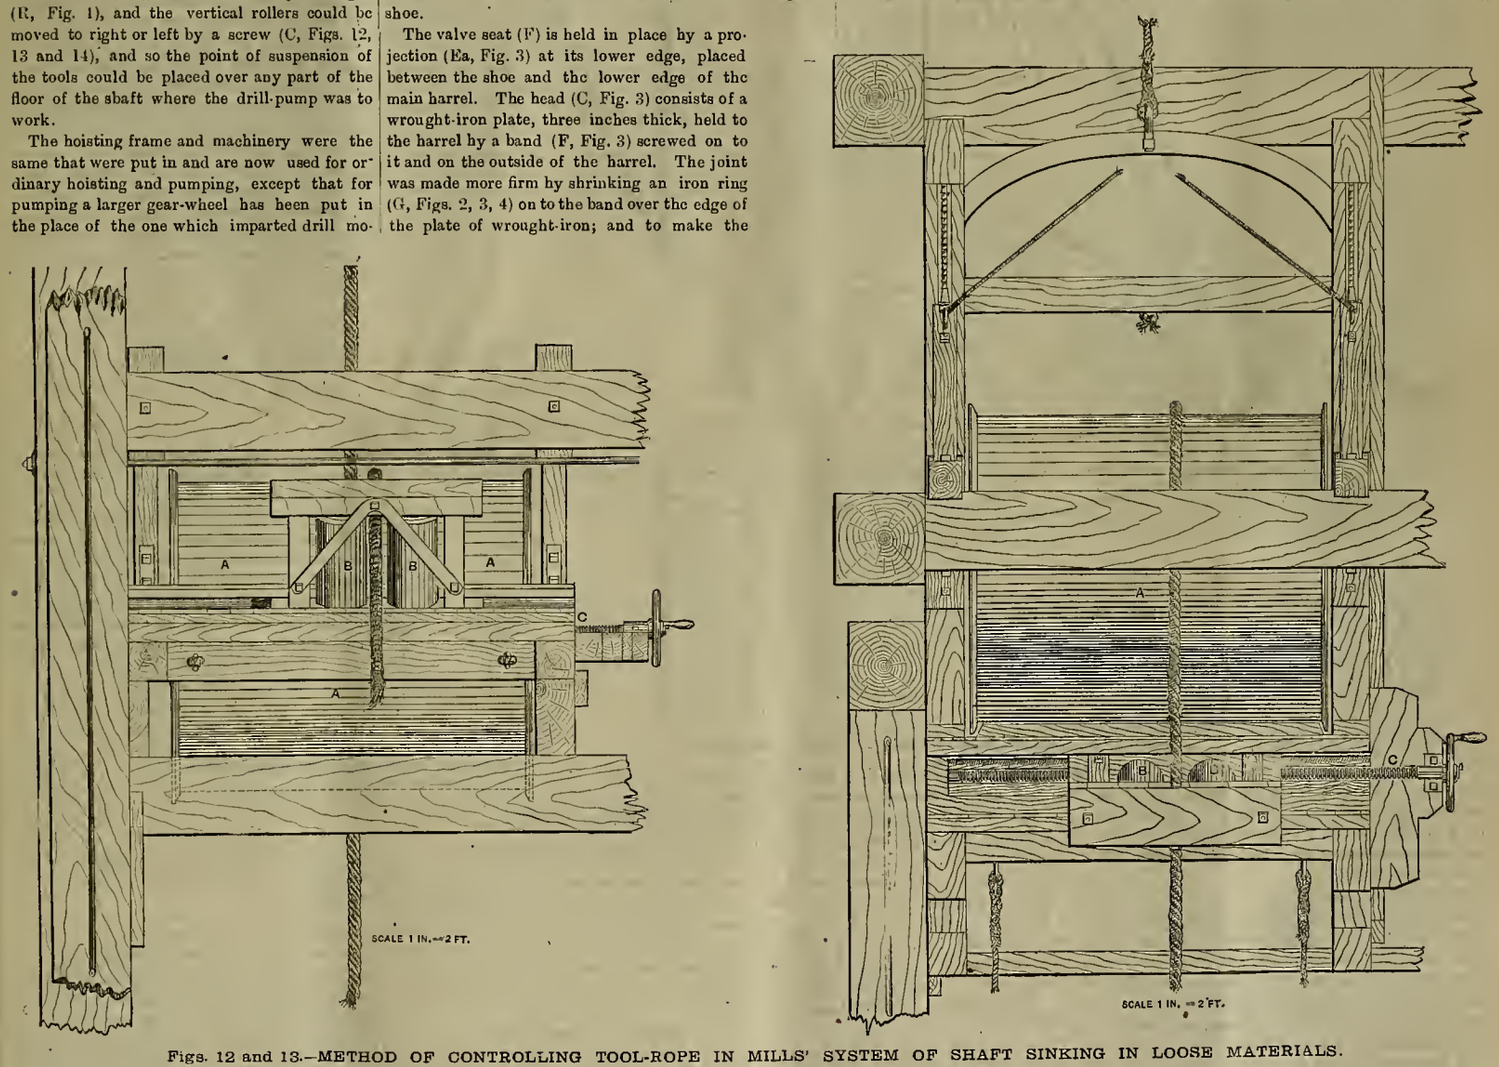
The pin (D, Figs. 2, 3, 4) by which the drill-pump is attached to the auger stem, is screwed into the iron plate of the head, as shown in Fig. 3. An opening (H, Figs. 1 and 4) below the head let out the air as the drill-pump descended into the shaft, and the water above the load during the drilling. The load was taken out of the barrel shoe through the opening (I, Fig. 4) just over the with a small hoe made for the purpose. The opening was closed by the gate (J, Figs. 2, 3, 4). To prevent hitting the butt-straps of the caisson with the sharp edge of the shoe and the upper edge of the pump, the guard of wood and iron (K, Fig. 4) was put on. The weight of the tools as suspended was as follows:

	Lbs.
Pump	872½
Augur-stem	672
Jars	384
Sinker-bar	438
Rope-socket	54
Total	2,440

To this must be added the weight of the rope, which increased with the depth. But the weight of the rope, rope-socket, sinker-bar and upper link of the jars added nothing directly to the force of the downward blow, and, aided it only by overcoming the friction of the rope in passing through the water. In fact the sinker-bar was omitted for the greater part of the distance, but toward the last seemed to be of some service, especially when the water was thick with mud. The wood of the pump guard weighed about 72½ pounds when water-soaked, not far from the weight of the water it displaced, and neither increased nor lessened the force of the blow materially. There remained of the pump 800 pounds of iron, which, with the 692 lbs. of the augur-stem and the 193 pounds of the lower link of the jars, made a weight of iron 1,690 pounds. This, falling through water, is equal to 1,472 pounds falling through the air, with some deduction to be made for the difference between the frictional resistance of air and water, and some further deduction for the greater weight and frictional resistance of the water when heavily charged with mud in suspension. The weight and consequent force of the blow increased as the pump became loaded, and at times the weight reached nearly the equivalent of a ton falling through air. The lift and drop of the tools when drilling which was found best fitted for safe and efficient working of the machinery was 2 feet, and the number of drops 32 per minute.

When the drilling was going on a man stood with his hand at the temper-screw to let down the tools by turning the screw as the drill-pump excavated, fast enough to render the blow effective, but not enough to permit the tools to topple over against the caisson. He could judge of the blow by the jar at his hand.

The length of time required to load the drill-pump varied with the character and compactness of the material, but it was generally kept in motion at the bottom 20 minutes. The raising and lowering, connecting and disconnecting at the clamp and wrist-pin, taking out the gate and the load, and replacing the gate, took about 10 minutes more, making 30 minutes to each



Figs. 12 and 13.—METHOD OF CONTROLLING TOOL-ROPE IN MILLS' SYSTEM OF SHAFT SINKING IN LOOSE MATERIALS.

oharge, or two charges to the hour. The area of the cross-section of the caisson, including its wall, is 16.5 square feet, and the area of cross-section of the drill pump 0.785 of a foot, or ahout one and one-twenty-first of that of the caisson. The matsrial in ths drill pump was less compact than in place at the hottom of the shaft. A load of 1 foot in depth in the drill pump would lower the bottom of the shaft ahout one-half inch, and a load—quite oftcn attained—of 4 feet in depth of the drill pump would lower the hottom of the shaft two inches, and 20 such loads in a day of 10 hours would lower it 40 inchss. The latter rate of sinking was somstimes attained, hut the average rats was much lower.

The caisson was put into the rectangular shaft A, Fig. 1, which bad already heensunk 14 feet, and the space outside of the caisson and within the rectangular shaft filled with clay. The only settling ahout the shaft observahle at the surface, was within the reotangular shaft. It was hut little, and as it took plaoe, clay was added at the top.

Before the work was fairly started, some days had heen spent in hecoming accustomed to the work and making needed alterations in the tools; and during this time the caisson had heen sunk five feet, or to 19 feet from the surface. The shaft and caisson were sunk the next 59.6 feet, or to 78.6 feet helow the surface, in 41 working days of ten hours each, or at the rate of 1.45 feet per day. This included the time spent in putting on new sections to the caisson, whicb was 13.6 days.

At this depth (78.6 feet helow surface), the water was taken out of the shaft. The material passed through had become more compact from ahout 60 feet downward, and I had expected to sink from here hy ordinary methods; hut the inflow of water at the hottom, which was at first 3.2 cuhic feet a minute, increased in ahout four hours to 5.3 cubic feet per minute, and it was plainly hest to continue on with the method that had succeeded so well thus far. The caisson was in good condition, whole and water-tight, hut slightly curved from end to end, so that the center at the bottom was ahout 4⅜ inches from a plumb-line dropped from the center at the top.

After a delay of some months in gettiug more sections of caisson, work was resnmed, and the shaft was excavated and the caisson sunk 102.4 feet further, or to 181 feet helow natural surface in 91 days of ten hours each, actually spent upon the work. This included 22½ days spent in putting on new sections of caisson.

To this point the working force consisted of one skilled man to tend the engine, and two skilled drillers, and one or two lahorers a portion of the time to aid at the screws, hesides the engineer in oharge. The working time was limited to ten hours a day, hecause the work was novel and it seemed hardly safe to have it go on in my ahsence, and also hscauss I wished to ohserve carefully the character of the deposits passed through. The principal danger was that the excavations might he carried too far ahead of the caisson, and so cause caving and loosening of the material ahout the caisson. This would he ohviated if hydraulic presses were suhstituted for screws as ahove suggested.

At the depth now reached (181 feet), the effeot of the curve in the shaft hegan to be seriously felt; for tbe drill-pump hanging vertically from the top could not he made to drop ou to all parts of the floor, and left untouched a crescent-shaped area under the over-hanging portion of the cylinders. The material thus left had to hs partly caved in and partly crowded in hy incrsased pressure on the caisson. The force at the screws was increased, and consisted at timss of six men; and a few weeks later the pressure of the screws was reinforced hy hlows of a ram consisting of a stick of timher of 21 inches square and 22½ feet long, weighing, with eye-holt, nut and washer hy which it was suspended, 2,280 ponnds. This was dropped two feet, 30 times a minute, on to a timher placed hetween the timhers on which the screws acted directly and the upper edge of the caisson.

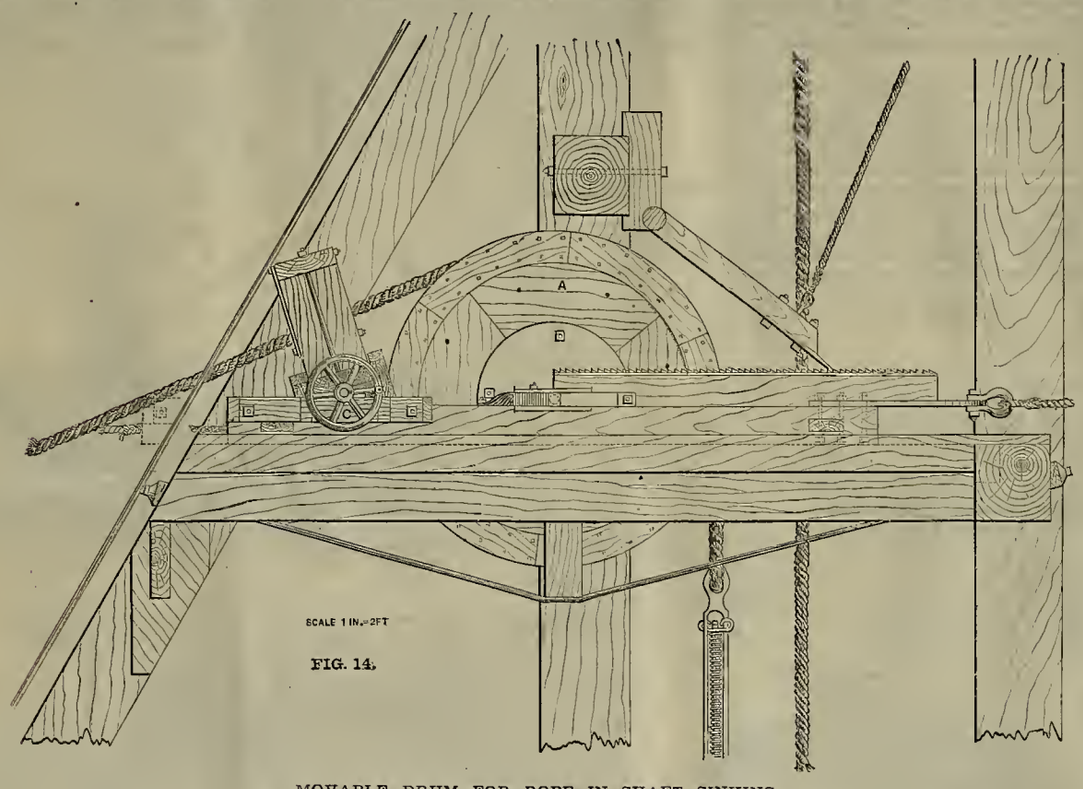


FIG. 14.

MOVABLE DRUM FOR ROPE IN SHAFT SINKING.

Including the time consumed in putting on the ram, and putting on new sections, it took 23.5 days to sink the caisson the next 15.5 feet, to the depth of 196.5 feet helow the surface. The excavation was 5.7 feet deeper.

The water was then again hailed out of the shaft. The curve of the shaft now left nearly half of the floor outside of the direct blow of the drill pump, and in the area thus out of reach were houlders of hard material and flattened shape, one of which was 0.44 cuhic foot in hulk. These materials on the higher part of the floor were cut down by hand and thrown to the other side where the drill pump could reach them, and then taken out hy the drill pump. In all, ahout four hours of time was spent in excavating hy hand, and this was all the excavating done hy hand in sinking the shaft.

At the lower edge the shoe showed a slight hulge, extending over ahout nine square inches of area, and projecting inwards about one-half inch at the middle of the bulge. Otherwise the caisson was unimpaired.

The iuflow of water was varying, hut at first averaged ahout 1.21 cuhic feet per minute, and increased to ahout 2.34 cuhic feet.

The next 13.5 feet hrought the caisson to tbe surface of the hed-rock, at 210 feet below the natural surface. It took 23 days, including the time (4 days) spent in putting on two sections of caisson.

The bed-rock was a friable and rather soft clay slate, and was easily excavated with ths drill-pump. The caisson was sunk 20.7 feet in the hed-rock, to the depth of 230.7 feet helow natural surface. To sink this 20.7 feet in hedrock took 46 working days, including all the time of excavating, pressing caisson and putting on the sections of caisson.

After a month's delay the water was hailed out of the sbaft. The caisson was in good condition, hut somewhat deformed at its lower edge—not enough, however, to materially impair its usefuluess. I think this deformation was caused hy the hed-rock swelling and pressing against it unevenly.

The inflow of water varied, hut averaged ahout 3.6 cuhic feet per minuts, or less than 5½ per cent of the inflow at 14 fset from the surface. It came through the hed-rock clear, and was therefore not enlarging its channels.

The shaft had not only heen sunk successfully through 210 feet of loose materials and 20.7 feet of rock, hut the caisson had shut out the water of the upper loose gravels and sands and of the lower layers of similar materials, had prevented the running in of sand, and left, to he contended with at the hottom, only a small inflow of clear water coming through rock.

A partition with ladder attached was put in, as shown in Fig. 15 (see page 381), dividing the shaft into hoisting and pumping compartments, and a common "jack head" pump, of five inches diameter and four feet stroke, was carried down at the same time with the partition.

A portion of the hed-rock was found loose and running, and where it was so, rods of round iron, one inch in diameter and three feet long, were driven into the rock through holes drilled through the shoe, two inches ahove its lower edge, and two inches apart from center to center, and into the hed-rock as far as the rods were to go.

The shaft was theu sunk hy hand four feet helow the lower edge of the shoe for a sump, and secured hy staves driven around iron hoops. The staves were started ahout a temporary hoop of outside diameter three inches less than the inside diameter of the shoe, hut the other hoops have the same inside diameter as the caisson, and when the staves were all in they were pushed outward and upward hy the outer surface of the shoe, so as to rest against it at their upper ends.

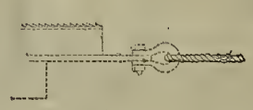
A row of iron rods like those hefore mentioned was driven over the space where the opening for the drift or gallery was to he made, and just above the second butt-strap, counting from the hottom. The opening was cut out through the caisson hetween the lower edge of this butt-strap, and the upper edge of the shoe. The plan of the opening and the timhers at the heginning of the drift are given in Fig. 16 (see page 381.)

As long as tbe work is one of exploration, kihhles will answer for hoisting; hut, when necessary, a cage can he used to occupy the whole cross section of the hoisting apartmsnt, aud when still more hoisting room is needed, another shaft can he sunk near hy, and one of the two given up wholly to hoisting, and the other left for pump, ladder-way and ventilating pipes; and, indeed, the capacity can hs increased, to any required extent, by sinking a group of such shafts near one another, hut with space enough hetwesn thsm to prevent hreaking down or disturbing the ground hetween them while sinking. Shafts much larger than the one here described, indeed, of any ordinary size, could be sunk hy the same method.

All the serious difficulty which this methodof sinking encountered was caused hy the curve of the caisson; and this is an unavoidahls difficnlty. The nse of hydraulic presses, as ahove suggested, wonld ohviate the danger of excavating too far below the foot of the caisson, and would reduce the working force to three skilled hands.

The method is not only an efficient one where ordinary methods would fail, but it is also an economical, rapid and safe method of sinking through water-hearing, loose matsrials, and could he applied to sinking caissons for hridge piers and other foundations, as well as to mining shafts and large artesian wells.

I have given above the time actually spsnt in sinking. The work was not, however, dons continuously, hut in intervals of time spent partly in waiting for new sections of caisson to he made aud transported to the ground, hut principally caused hy delay in ordering them. The drilling hegan August 21, 1882, and ended November 29, 1883. The tools wers contracted for in March, 1882, and at the same time 80 feet in length of the caisson, with shoe, screws, etc. The remaining sections of caisson were ordered in several lots. The reason for not obtaining enough to go to the hottom after the experiens



of a few feet had proved the efficiency of the excavating tools, was the lack of data for judging of the friction to be encountered.

If the caisson had heen perfectly vertical, I could now present definite data for determining the friction to he overcome under similar conditions; hut on account of the curve in the shaft the necessary friction on the onter surface of the caisson cannot he separated from the added resistance of the materials at the hottom which were not reached directly hy the drill pump, and I can therefore add little on the suhject to what is ahove shown, namely, that to the depth of 230 feet the friction on the outer surface of such a caisson carried through such materials is overcome with a pressure easily applied and safely within the endurance of a wrought-iron cylinder, having the thickness of iron proportioned to area of its cross-section as in the one ahove described, and having a shoe of rolled steel, proportioned as the one described.

MINING DECISION.—Secretary Lamar bas issued an order of interest to miners everywhere on the public domain. On December 4, 1884, while thousands of mining claims were pending, an order was made hy Secretary Teller that in applications for lode claims, where the survey conflicts with a prior claim and the ground in conflict is excluded, the applicant not only has no right to the excluded ground hut he has no right to that portion of any vein or lode the top or apex of which lies within such excluded ground, unless the location was prior to May 10, 1872. The order now made puts things hack just where they were before Mr. Teller's order was issued, as follows: In entries made prior to the receipt hy the register and receiver of the circular of Decemher, 1884, the survey, if free from objection under the former practice, need not he amended to conform to the provisions of paragraph 2 of said oircular. All deoisions under said circular in conflict with the foregoing may to that extent he recalled.

SEVERAL prospectors from New River arrived in town last Friday broke. They say they did not find the new camp what they were led to helieve hy newspaper reports, hut notwithstanding their hard luck tbey speak well of the country, and helieve that several good mines will be developed there.—*Shasta Co. Democrat.*

MECHANICAL PROGRESS.

The Effect of Oil in Boilers.

Ths Hartford Steam Boiler and Inspection o. have recently published the particulars of ie peculiar effect which oil applied to the in- rior of a boiler may have upon the same. In e case in question the boiler had been cleaned Sunday, and at that time a gallon or mors "black oil" had been thrown into it. On onday morning the boiler was fired up, and n through the day at a pressure of 90 pounds. ie engine was stopped at 6 o'clock P. M. and ain fired up at 9 o'clock the same evening. hile firing up a large bulge or projection was served on the plate directly over the fire; the mensions of which were four feet lengthwise d three feet girthwise. The metal, originally s-third of an inch in thickness was drawn wn to one-eighth without fracture—proving at the iron was very superior.

Ths expert exeminer employed by the com- ny roported that ths bulging was undoubtedly e to ths presence of the oil or grease in the iler. The explanation was given as follows: ie grease settles down on ths fire sheets, nen the draft is closed and the circulation of ter nearly stops—thus contact between the ate and water is prevented, and as a conse- ence the pletes become overheated, under nich circumstances a comparatively low pres- re will be sufficient to bnlge the sbects so ated.

The advics given was that when oil is used remove scale too much care cennot be used maks sure that it is free from greese or ani- l oil. Nothing but pure mineral oil should used. It should be borns in mind that crude troleum is one thing; black oil, which may an almost enything, is very likely to he mething quite different.

The action of grease in a boiler is peculiar. does not dissolve in the water, nor does it compose, neither does it remain on the top of e weter, but seems to form itself into what ay be termed "slugs," which et first seem bs slightly lighter than water. After a ort season of boiling these slugs or suspended ops seem to ecquire a certain degree of sticki- ss, so that when they ars brought into con- ct with the shell and flues of the boiler (as ey ars carried about by the circulation of s water) they hegin to adhere thereto. nen under the process of heat they begin e process of. "varnishing" the interior of e boiler. And it has been found, says the port, that "the thinnest possible coating of is varnish is sufficient to bring about over- eating of the plates."

The time when damage is most likely to cur is after ths fires are hanked, for then the rmation of steam being checked, the circula- on of water stops, and the grease thus bas an portunity to settle on the bottom of the iler and prevent contact of the water with ie fire sheets. Under these circumstances, a ry low degree of heat in the furnece or pres- re in ths boiler is sufficient to overbeat the ates end cause bulging.

It was probably between the hours of 6 and o'clock P. M., while the fires were hanked, nd the pressure only 40 pounds that the bulg- g took place in the boiler which has furnished is facts for this article.

Bisulphide of Carbon Again.

The Middlesex Electric Light Company of owell has just built and put in operation at eir works in that city a bisulphide of carbon ngine—or as it has been sometimes called "the riple thermic motor." Quite a little excite- ient it will be recollected was caused by the ttempt to put to practical use one of hese engines about a year ago. The experi- ient proved a failure by reason of the impossi- ility of making tight joints. In spite of all fforts to retain the gas it would escape in such uantities as to make its presence unbearable, not decidedly dangerous to life. There is no uestion in regard to the great economy of the se bisnlpbur of carbon if its use can also be ade practicable. In the use of this gas the isulphide is vaporized by steam, and not by omediate application of fire. The boilere and ipes conveying bisulphide vapor are all encased other boilers and pipes containing hot steam. s this agent attacks all oils, the lubricant ed is pulverized plumbago, which is euspend- l in a liquid, the composition of which is nown only to the inventors. The machine nsists of two 24-horse-power steam boilers, o large bisulphide boilere of a capacity of 500 unds of bisulphide liquid each, and an ordinary gine of Fitchburg manufacture, of 170 horse- wer. At the preliminary trial which took ace some three weeks since, a small wood fire as built under one of the steam boilers, and hen the engine was started the steam gauge dicated a pressure of 30 pounds, while the sulphide gauge showed 60 pounds. There was rface pressure of two pounds. The engine rted slowly and was kept at uniform speed, l the engineer again turned the valve and in- eased the revolutions to a great velocity. nen it was slackened at the engineer's will, d the whole machine seemed to be under st perfect control. Profs. Trowbridge, of Harvard, Trowbridge, of Columbia, and Rich- ards, of Yale are expected in Lowell before long to make a scientific test of the new engine."

Much interest is felt for the forthcoming re- port of the eminent gentlemen named, on ths practicability of this new motive power. Its success would work an important revolution in ths use of steam.

Steel for Structural Purposes.

The growing quantity of steel used for structurel purposes has attracted some etten- tion. One of the largest, if not the largest, works in the country is steadily increasing its make of steel, while it is more and more de- parting from the use of wrought-iron, and other establishments which were producing steel exclusively for railroad purposes are turn- ing to the manufacture of structural shapes. An animated discussion of ths relative value of the two materials may therefore be looked for- ward to at an early date. An argument is now being heard which will probably grow in favor with the supporters of wrought-iron for beams, for instance. It is urged that the duty of a beam is to maintain absolute rigidity; that the material of which it is composed is not to be subjected to stresses taxing its final tensile strength. Any material, whether it be iron or steel, can sustain certain loads before the slightest changes in its external form takes place. The effect of strains up to that point will be a state of intermolecular tension, which to a certain degree even the slightest load pro- duces. It is held that ths value of a material which is to be used as a beam depends upon the load which it can carry before that intermolecu- lar tension has reached a point where it finds expression in the first evidence of deflection. It is argued that it is not so much the mechanical resistance of the material to loads after that point has been reached as the preliminary or intermolecular tension a material will hear which determines its value as a beam. It is argued that the efficiency of a beam in this re- spect is proportional rather to its mess than to the mechanical qualities of the material, and thet, therefore, it is misleading to claim that because steel has a higher tensile strength a smaller weight will bear ths same loads before deflection sets in. The rigidity of a beam, therefore, depends not so much upon the quality of the material, but upon its mass.—*Boston Journal of Commerce.*

Kerosene in Boilers.

In regard to the value of kerosene or mineral oil for boilers, we append the following item of experience recently furnished by a corres- pondent of the Boston *Journal of Commerce:*

"Several years ago the writer was engaged to take charge of a steam plant in what is known as the alkali region. The water was so impregnated with minerals that is was next to impossible to keep boilers in passable condition, and many were ruined before they had been in service two years. This plant had been in operation only three months, yet the deposit in the boilers was, to our unaccustomed eyes and experience, very heavy. All kinds of scale ex- terminators were used, but to no purpose. At length, in desperation, while cleaning boilers, we took kerosene oil and thoroughly saturated the scale with it and let the boilers stand until the scale had absorbed all the oil before filling with water. After two weeks' run the boilers were emptied for cleaning. Upon taking off the hand-hole plates we found the bottom of the boilers covered with detached scale. The tubes looked as though they were just recover- ing from an attack of small-pox, while the scale which still adhered to them could easily be re- moved. We again wet the heads and other spots where the deposit had not been removed with oil. The next run was of four weeks' duration—just twice those before—and when we cleaned them we found clean boilers. After that boilers were only emptied once in six weeks. Our success has induced other engineers to try kerosene, and their trials always proved successful. After considering the matter, we arranged so as to be able to in- ject the oil in small quantities while the boilers were in use, and after that will give them about one quart per week to each boiler that was 5 feet diameter by 18 feet long. Kerosene must be used with judgment, for too much will un- doubtedly ruin a boiler. The amount needed to do the work is very little. I will state that the above happened in 1875, and that same battery is in use to-day and in good condition, and that the average life of a boiler in that region heretofore has been about five years."

WATER IN STEAM.—Herr Stoupler, of Lu- cerne, Switzerland, by adding fluorescine to the water of a boiler, which by calorimetric test enabled him to detect the presence of one-half of the one per cent of water carried mechanic- ally out of the boiler by the steam, found that from two, three to four per cent was actually thus present in the steam. The deep green color of the water in the boiler was retained in it for weeks, and yet no trace of coloring could be detected in the water condensed in the steam cylinder, a proof that the water which gathers there is entirely due to condensation caused by the expansion of steam, and that very little water is actually mechanically car- ried away by the steam from boilers.

SCIENTIFIC PROGRESS.

The Cause of Storms.

Storms are caused by a strong and extensive upward motion of the air, by which means its vapor is condensed by the cold of elevation. The atmosphere receives heat from the sun, and loses heat by radiation. One-fourth of the rays of the sun are absorbed in passing verti- cally through the atmosphere. The remaining three-fourths are absorbed by the earth's sur- face, by which means its temperature is raised, and heat is thence communicated to the air which rests upon the earth. The atmosphere thus receives its heat chiefly at the bottom, and in consequence of radiation loses it most rapidly at the top. The density of the air is dimin- ished by an increase of heat. The atmosphere is in a state of unstable equilibrium, and the lower strata tend continually to rise and take the place of the upper. Such ascending cur- rents are formed on every tranquil day. As the air ascends it comes under diminished pres- sure and expands. As it expands it cools at the rate of about 38 degrees for two miles of ascent. This ascending air carries with it the vapor which it contained at the earth's surface, and if it rises high enough, the cold produced by expansion will condense a portion of this vapor into cloud. The hight to which air must ascend before it will be cold enough to form cloud depends upon the difference between the dew-point and the temperature of the air. If the dew-point be 10 degrees below the temper- ature of the air, cloud will begin to form when the ascending current has risen about 1,500 feet.

Winter Storms

Commence gradually, and generally attain their greatest violence only after a lapse of several days. After a certain period their violence gradually diminishes, and at length they disap- pear entirely. This succession of changes re- quires a period of several days. Sometimes one or two weeks or longer. Occasionally all these changes are experienced over the same country; that is, the storm makes no progress from place to place. More commonly the storm travels along the earth's surface, and although the same storm may continue for one or two weeks, or even longer, its duration at any one place may not exceed one or two days. Throughout the middle latitudes of this continent, where violent storms advance with considerable rapidity, the direction of progress is always from west to east. The rate of progress of storms varies from zero to 44 miles per hour. They generally travel from St. Louis to New York in about 24 hours, and from New York to Newfoundland in another 24 hours. While they advance steadily eastward the wind has every possible direction at different places within the limits of the storm. At places on the north side of the center of a great storm the wind generally sets in from the north of east as the storm approaches, as the storm passes by the wind changes to the northwest, backing round to ths north point. At places on the south side of the center of the storm the wind generally sets in from the south of east as the storm approaches; as ths storm passes by, the wind changes to the southwest, veering round by the south point; ths latter is exactly what takes place here in the Sacramento valley, which is an evidence that the storm's center is to the north of California, and that we are al- ways on the south side of the storm's center. If the storm's center passed to the south of us we would have mostly snow in winter instead of rain, for in that case the wind would be northeast in advance of the storm, and as the storm passes the wind would back to north and then northwest; and those winds being cold winds, we would have snow. The snow we had a year ago last winter was from storms, whose center passed south of the Sacramento valley.

An Interesting Experiment.

In a portion of *La Nature* commonly devoted to the illustration and description of physical phenomena, which may he produced without special apparatus, and are, consequently, of peculiar interest in respect of the demonstra- tion of principles in the lecture room, etc., there were recently published directions for the production of illuminating gas from paper. In the first place, the general effect of carboniza- tion is to be shown by burning, upon a clean, dry porcelain plate, a piece of white paper the size of the hand. The white paper not only be- comes a black mass, but also underneath the thin carbon will be found a yellowish stain upon the plate, which is due to the condensation of the residual products of the carbonization of paper. There has been, in fact, besides the free inflammation of the gases of the paper upon their contact with the air, a process of distillation and condensation from the same gases as developed from the under side of the paper, which is less accessible by the air. In order to show that gas is really devolved in this way, a sheet of stout wrapping-paper may he twisted into a cone, with an open end. The point of the cone is then to be held in one hand, the open base being inclined downward at an angle of about 45 degrees. A small hole is to be made in the upper part of the cone, near the apex; and the paper is then to be ignited at the base. As it burns, a true distillation goes on in the interior of the cone, and the gases escape from the small hole at the top, where they may be ignited. The demonstration is, of course, very brief, for the paper consumes soon burnt; but it is sufficient to prove how illuminating gas is produced by the distillation of organic matter in closed vessels. A little practice will give the necessary facilities in handling the burning cone, so as to give the gas time to form and escape under sufficient pressure from the hole made for the purpose.

THE AIR AND THE TELESCOPE.—The astrono- mer, in viewing the heavenly bodies constantly, labors under great disadvantage, both from the effect which the air exerts upon the telescope and that which the instrument has upon the at- mosphere, through which he is looking. The air, says a writer, is his enemy in two ways. Part of the light which brings its wonderful, evanescent messages across inconceivable depths of space it stops; and when it does not stop, it shatters. And this even when it is most trans- parent and seemingly still; when mist veils are withdrawn, and no clouds curtain the sky.

Moreover, the evil grows with the power of the instrument. Atmospheric troubles are magnified neither more nor less than the ob- jects viewed across them. Thus Lord Rosse's giant reflector possesses—nominally—a magni- fying power of 6,000; that is to say, it can re- duce the apparent distances of the heavenly bodies to one six-thousandth under their actual amount. The moon, for example, which is in reality separated from the earth's surface by an interval of about 234,000 miles, is shown as if removed only 39 miles. Unfortunately, how- ever, in theory only. Professor Newcomb compares the sight obtained under such cir- cumstances to a glimpse through several yards of running water, and doubts whether our satel- lite has ever been seen to such advantage as it would be if brought—substantially, not merely optically—within 500 miles of the unassisted eye.

A SELF-CONTAINED ELECTRIC LAMP.—Recent experiments have been made in electric light- ing to make each lamp contain its own battery, and have succeeded perfectly. This success has been affected by means of the Skrivanoff pri- mary battery, the elements of which consist of a small packet of chloride of silver and two plates of zinc placed in the cell with a weak so- lution of caustic potash. A small battery is placed in the stand of a moderator or other similar kind of lamp, which can thus be utilized for the purpose, a glow-lamp being fixed on the top in place of the ordinary burner. Experi- ments have shown that such a lamp will burn 12 hours with undiminished brilliancy, but that at the end of that time the silver will have been converted into pure silver and would re- quire to be revivified. This is easily effected by washing it in a solution of nitric and hydro- chloric acid. It is then replaced in the battery for further use, there being no waste of the sil- ver. The marked advantages of this system of domestic electric lighting, beyong the portabil- ity of the lamps, are the absence of fumes, the small battery capacity, and the great electro- motive force.

DRY ROT.—A Russian professor has been ex- perimenting on the best way to remove dry rot. He says that a thorough draught will destroy the parasite within twenty-four hours. If the action of draught be assisted by that of sun- light, a few hours will often suffice to put a stop to further damage. A concentrated solu- tion of common salt is very efficacious, and the stronger it is used the more rapid its action. The action of a concentrated solution of cupric sulphate (blue stone, blue vitriol) is still more energetic and complete than that of common salt. Crude carbolic acid is rapid in its action and cheap, but inconvenient to use. But he considers that the best, cheapest, and most con- venient material to employ is the tar obtained when birch wood is distilled for acetic acid; the under surfaces of the flooring are painted with the tar.

A NEW YORK ELECTRICIAN, Prof. N. S. Keith, has invented an electrical storage bat- tery, similar in working power, but simpler in form, to that of Faure, and a company of San Francisco capitalists has just been formed for putting it into practical use. It is proposed to employ it for electric lighting, and also to run motors and street railroads. Prof. Keith claims for his invention that fully 70 per cent of the power generated can be used in moving passen- gers in an ordinary street car, while with the cable systems only 32 per cent is available. Very little change is necessary to apply electric- ity to cars previously drawn by horses. It is said that one of the San Francisco systems of street cars is about to be run by the new elec- tric Keith motors and storage batteries.

ANOTHER USE FOR ELECTRICITY.—Still another wonderful use has been found for electricity. Recently, electrodes connected with a dynamo of the power of forty ordinary Daniell cells were put into forty-five gallons of fresh milk, and in exactly four and one-half minutes the fluid was, as dairymen say, churned, the butter rising on the surface. The quantity obtained was fully equal to that procured in the ordinary way, and the quality perfect.

A SINGULAR GROUP OF SPRINGS.—A remark- able collection of mineral springs exist in North Georgia. They are known as the Catoosa Springs, and consist of fifty-two springs, all different in character, within the space of a two-acre plat.

TABLE OF CONTENTS.

EDITORIALS.—Shaft Sinking, 377. Passing Events; Power Used in California Manufactories; Petroleum; A Novel Exhibition; Mine Pointers; A Reason for Mining Activity, 380. Shasta County Districts; Local Notes, 381.

ILLUSTRATIONS.—Figs. 12 and 13—Method of Controlling Tool-Rope in Mills' System of Shaft Sinking in Loose Materials, 377. Movable Drum for Rope in Shaft Sinking, 378. Plan of Opening and Timbers at Beginning of Drift, 381.

MECHANICAL PROGRESS.—The Effect of Oil in Boilers; Bisulphide of Carbon Again; Steel for Structural Purposes; Kerosene in Boilers; Water in Steam, 379.

SCIENTIFIC PROGRESS.—The Cause of Storms; An Interesting Experiment; The Air and the Telescope; A Self-Contained Electric Lamp; Dry Rot; Another Use for Electricity; A Singular Group of Springs, 379.

USEFUL INFORMATION.—Toughened Glass; The Gold Beater's Art; To Cleanse a Soiled Chamois Leather; A Valuable Device for Warm Weather; A Valuable Enamel; Ship Building in Norway; The American Association for the Advancement of Science; Flexible Limestone, 383.

GOOD HEALTH.—Does Death Sting; Cause of Pneumonia; What is Old Age; Why Contagious Diseases Attack but Once, 383.

MISCELLANEOUS.—Auriferous Gravel in Arizona; The Duncan Concentrator; Transit of Jupiter's Fourth Satellite; Calico Mines; Prospectors and Mining Bosses, 382. Practical Mining, 383.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 384-85.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 388.

Passing Events.

The receut gold strike in Oregon, mentioned on another page in our "Mining Summary" seems to he creating quite a local excitement. It will douhtless lead to much more vigorous prospecting in that region. Southern and Southeastern Oregon have not heen very thoroughly prospected, and there are douhtless many good leads there.

The good fortune of the Mayflower Gravel Company, in Placer county, is an interesting current topic. The gravel encountered reminds minere of the early daye of mining in this State. How much of this very rich gravel there ie remaiue to he seen; hut the days of rich, auriferous material are hy no means over yet in California.

The disorganization of the engineer corps of hoth the Southern and Central Pacific Railroad companies is an apparent evidence that for a time, at least, further railroad building on this coast will be discontinued.

The prices of lead and copper still continue very low, much to the detriment of many mining companies on this coast. It is the general opinion, however, that they will go no lower. Still, if they do, some of the mines now working will he compelled to close down.

Iron Moulders' Union No. 164 has sent the following notice to thc local foundries: This is to inform you that on and after Monday, June 8, 1885, Iron Moulder's Union, No. 164 of San Francisco, will uot allow any of its memhers to work in your establishment at a rate of pay less than $3.25 a day, whether by day work or piece work. Apprentices upon serving their term of apprenticeship shall be allowed a period of six montbs before coming under tbis schedule.

Power Used in California Manufactures.

Durlug the ten years betwesn the ninth and tenth census it was found that the total amount of power used in manufactures, both steam and water, in the United States, increased 1,064,695 horse-power. Of this increase, 94,948 horse-power, or 8.92 per cent, is due to the increase of water-power used, while 969,747 horse-power, or 91.08 per cent, is due to the increase in the amount of steam-power used. From 1870 to 1880, the average amount of power used per hand has increased from 1.14 horse-power to 1.25 horse-power. The average power of water-wheels has fallen off from 22.16 horse-power to 22.12, which is largely due to the various forms of small water-wheels, or motors for light work. The average power of steam engines has increased from 30.29 horse-power to 38.69. The total amount of horse-power in uss in manufaotures in this country is 3,410,837; 35.93 per ceut is water and 64.07 per cent steam power.

Government statietics show that the total steam and water-power used in manufactures in California equal 32.921, a percentage of inorease in ten years of 29.76 per cent. We used in 1870, of our total horse-power, 35.60 water and 64.40 per cent eteam. In 1880 we used 31.87 per cent water and 68.13 steam, showing that we are coming more and more to steam.

California ranks among the States as No. 25 in the total power used in manufactures. The percentage of the total steam and water-power of California is 0.17. The rank in water-power is 36; percentage of the total water-power, 0.15; rank in steam-power, 36; percentage of the total steam-power, 0.18. California has 155,980 square miles. The total eteam and water-power per square mile is 0.21 horse-power; water-power per square mile, 0.03; steam-power per square mile, 0.18.

In manufacturing in this State there are 1,000 establishments using power. They use 205 water-wheels, of 4,850 horse-power; 990 boilers, 179 engines, with a power of 28,071 horses, making total steam and water-power in horse-powers, 32.921. The following tahle, from the census reports, will show the distribution in this State:

SELECTED INDUSTRIES.	No. of establishments.	WATER-POWER. Number of wheels.	WATER-POWER. Horse-power.	STEAM-POWER. Number of boilers.	STEAM-POWER. Number of engines.	STEAM-POWER. Horse-power.	Total steam and water power. (H. P.)

THE Cove Creek Sulphur Works, Utah, ship about three carloads of sulphur every week. It goes to Idaho, Oregon, Washington Territory, Wyoming, Colorado, New Mexico and Texas, and the demand is gradually hut steadily increasing as the merits of the Cove Creek product become known.

AMOS BOWMAN, formerly connected with the California State Geological Survey, has heen for some years past engaged in geological work in British Columbia. He is now at work surveying sections of the British Columhia coal fields.

Petroleum.

It may not he generally known, hut it is a fact, that California stands tbird in the list of petroleum producing States of the Union. Pennsylvania leads, and New York is second. After this State comes West Virginia, Ohio and Kentucky. Some little is found in Colorado, Wyoming and New Mexico, though not much has heen done in the latter places. California is gradually increasing her production, as new wells are opened in Southern California, and the industry is now a prosperous one here. As far hack as 1878 we produced here 15,227 harrels. In 1879 we increased to 19,858 harrels; 1880 showed returns of 42,399 harrels; 50,000 harrels in 1881, and 70,000 harrels in 1882. The year 1883 showed an increase, and this year the estimated production is over 100,000 harrels. A harrel is uniformly 42 gallons. Ws consums all the oil produced and ahout 100,000 gallons from the East as well.

The period of productiveness of an oil well is very uncertain, and almost all the owner can he positive of is that tbe well is producing; he cannot ascertain the prohable duration of its productiveness. As a general thing a large flowing well is but short lived, while a pumping well of moderate size is more likely to have a long life. The character of otber wells in a district and the length of time they have been producing, also furnish some assietance in solving the problem, but even with thie help a definite eolution is impossible. Varioue causes, and many no doubt of which nothing is known at present, conspire to check the production of oil wells, and the well, whether pumping or flowing, may euddenly cease producing and no reason he perceptihle. In a majority of cases, however, the wells fall off gradually until they cease to produce.

The average cost of producing a harrel of petroleum is very difficult to determine. This determination in the case of a single well depends, among other things, on the depth to which the well is drilled, and the difficulty attending the process; upon the cost of pumping, if not a flowing well; and upon the amount of oil produced. Accordingly it would he impoeeible to decide exactly the cost of a harrel of oil from an individual well, uutil it had ceased producing; while to ascertain the average cost of production, with reference to all the wells, would he a well-nigh impossihle task. Of course rough estimates have heen made, hut these have been generally in regard to pumping wells of small size, and of only local value; and a statement covering all kinds of wells and all the oil produced cannot be made.

A Novel Exhibition.

International expositions, trades exhihitions, fairs, etc., are so common in these days that they have come to he considered hy many as merely great advertising affairs. In fact, this seems to he the hest purpose they serve, although instructive in every way to the visitore. Rival manufacturers ehow their products to best advantage, and sections of country desiring immigrants, hring forward in a practical way all the advantages, by ehowing the mineral, agricultural and manufacturing material and products. New features have to be added to all tbe more prominent exhihitions, in ordcr to attract attention and visitors, and those held in the United States have been celehrated hy the variety of novelties presented.

It has remained for a foreign country, however, to make one exhihit which for novelty exceeds most of those of which we have heard. At the Antwerp exhibition they have beeu exhihiting a colliery. It is not a miniature or a mere wooden or plaster model, hut the complete model of the underground workings of a coal mine. There is the hoisting shaft, down which the visitor may travel into the darknese of the workings some 30 feet below ground. Here he will find everything ae it exists in an actual mine, less the firedamp. There are roads, faces of work and drifte in progress; even the water and the dirt have not heen forgotten, as the visitor will learn on returning to the daylight. Real miners have been provided to show how the work is performed, and horses not less real are there to haul the trains of tuhs to and fro. Such an exhihit was sure to attract hy its novelty, hut the result is even greater than the expectation of the promoters. The pithank is crowded from opening till closing time, hy persons patiently waiting their turn to descend.

Mine Pointers.

If half the energy and persistence put into efforts to sall mines wers put into efforts to work them the miners and the country would be hetter off. Where ore is producsd and shipped the huyers will hunt up the mins, whereas when it is unproductive the mine has to hunt up the huyers.

Nothing looks more damaging to a camp than to see a lot of half-opened mines lying idle. People who might invest get the impression on seeing idle claims that they cannot be worth much, or some of them, at least, would be worked. If claims are heing prospected right and left the natural inference is that the owners themselves think there is something in them, while when no work is heing done an appsarance of practical ahandonmsnt is given.

Prospectors should he encouraged in evsry way, and not looked upon as visionary msn who dislike regular work. Many good miners maks poor prospectors. Prospecting is a kind of work for which some men are particularly adapted, and hecause they lead a nomadic life it is no reason that they are not as good citizens as those living in a town for yeare. They are the pioneers of the mining oamps, and serve a most useful purpose, since the reeult of tbei searches is the hasie of the mining system.

Upon the active working of its mines is base the prosperity of any mining camp. The formation of companiee, the eelling of etock, the transfer of properties, the selling of town lots and the ereotion of buildings, all amount t nothing unless the mines are worked. A fictitioue prosperity may occur for otber reasons i a mining camp, but it can only last a few months unless active work is pushed in tb mines themeelves.

When tbe expenses of a mine have to be ou down in order to make a profit, the last ones t he discharged should be the underground miners. The "office" ought to be commenced on first In fact, there are a good many mines run on th "top-heavy" system, where a reduction of offic force would he a heneficial thing at any time

A Reason for Mining Activity.

The activity now going on in Shasta count mines appears to elicit more mention fro hoth local and metropolitan journals than really descrves. While there is nothing bu truth in the etatement that her mines are legic and rich, yet an investigation of her miner resources, when compared with other distric that lack tbe advertising facilities enjoyed b Shasta, ehowe that French Gulch and oth mining camps of tbat county now producin hullion and enjoying notoriety are merely d ing now what they could have done years ag f the proper attentiou had been paid to legit mate mining. There is one thing that Shasta present prosperity demonstrates, and tbat is th it pays to advertise. If it were not for the pres Shasta's wealth would, in all probability, l as dormant to-day as it was two years ag There are other mining districts in Californ that are as good, and possibly hetter, th Shasta, and they only lack capital and atte tion to demonstrate the fact that mining quartz in California is yet in its infancy. law punishing misrepresentations, a muzzle high-priced mine-owners, the hanishment high-salaried dude euperintendents, and t working of minee on "etrictly husiness" prin ples, is all that is needed to insure Shast continued proeperity, and create a legion other districts of like merit and hottom. Ma old diggings throughout the State, if work as these old minee of Shasta have heen and s now heing worked, would enjoy equal notorie and similar, if not greater, prosperity.

THE Nellie Grant lode, on the east eide of R Mountain, Montana, is to he worked hy a organized company. A meeting was held Helena and the following officers were elect President, Mosee Morris; vice-president, E. Dunphy; treasurer, Samuel T. Hauser; sec tary, W. E. Cullen. The capital stock is fi at $600,000, It was decided to immediat ehip machinery, such as hoieting wor pumps, etc., and as soon as they can he work will he hegun.

WORK has heen resnmed on the Blue Jac mine, at Bull Run, Nev. This mine was cated 15 years ago, and work was suspend upon it five years ago.

Local Notes.

The whole force of civil engineers of both the Central and Southern Pacific Railroad companies was dropped last week. The engineers received a hint to resign and they all did so, including Col. Geo. E. Gray, chief engineer of the Southern and C. P. Hood of the Central Pacific. It is understood that the engineer corps will be reorganized on a different basis entirely. What this basis is to be is so far known only to the managers. It is not likely, however, that the whole force will be again employed, as very little new railroad building is going on.

The eucalyptus boiler scale preventive made across the bay, and a California invention, is being introduced with success abroad. Mr. McGillivray, who is now in Liverpool, has been showing the steamship owners there what can be done in the way of preventing the formation of scale in boilers, and is meeting with success in introducing the compound. It is already quite extensively used on this coast.

The Association of Stationery Engineers of this city intend presenting a petition to the Board of Supervisors for an ordinance creating the office of boiler inspector. The association and others have for some time been endeavoring to get such an officer appointed, and the last Legislature was asked to pass a bill making a State office of the kind, but it did not do so. The recent lamentable occurrence at the Potrero, which is said to have resulted not only in an unfortunate young man's death, but also in making a maniac of his mother, has had the effect of causing the engineers to make a determined effort to have a boiler inspector whose duty it shall be to inspect once a year every boiler in the city, and also see that the proper material is put into boilers manufactured here. This man is expected to be a thorough, practical steam engineer, and he is to put all men in charge of the boilers through a course of examination to ascertain their efficiency. The inspector will be authorized to issue certificates to all competent engineers so employed and no one not holding such certificate will be allowed to have charge of or attend to a boiler.

Savage & Son, of the Empire Foundry, have concluded to pay all their employes the wages allowed by other iron firms, and that agreed upon by the contract made with the iron workers at the conclusion of the late strike. All the men in the Empire are now at work at the same wages allowed by the Union Works.

The Representative Council of the Iron Trades' Unions, which now has 1,500 members, met this week. There are six unions in the federation, and it has three representatives from each union. The executive committee reported, recommending a federation of all other unions of various industries, and to form a similar amalgamation. The report also recommended to carpenters and joiners the establishment of a permanent committee to look after the safe construction of buildings. The report further recommended the unions to report on the hiring and general apprentice system as practiced at the present time, with a view of having a law passed which will provide the means of turning out a better class of mechanics. Resolutions were also adopted to aid the Association of Stationary Engineers in their efforts toward having an ordinance providing for a boiler inspector.

Mr. C. M. Plum, one of the trustees of the James Lick estate, has returned from the East and brings gratifying intelligence concerning the object lens of the great telescope for the Lick Observatory on Mount Hamilton. It is already pretty generally understood here that the delay in the completion of the glass has been on account of the difficulty in obtaining a perfect crown glass for the achromatic object lens. The flint glass has been in Clark's establishment at Boston for two years or more. The crown glass, which, like the flint, was cast by Feil in Paris, has been delayed by circumstance which have occurred there. While Mr. Plum was East, Mr. Clark telegraphed to Feil, of Paris, inquiring with regard to the progress of the 36-inch crown glass lens, and he received the reply that a successful cast had at last been made, and that it was then being polished, that they might the better see that it was perfect. It was expected that it would soon be ready to ship to the Clarks at Boston, who will give it its configuration, and they as well as the trustees feel quite sanguine that there will be no further delays. The object glass will be 36 inches in diameter, and will cost $50,000,

Shasta County Districts.

[From Our Traveling Representative.]

The activity now going on in the French Gulch district places it in the lead of all other districts of the county at present. The mines now producing bullion are not new discoveries, as they have been known more or less for years past. Shasta's present boom is more of a renewal of work on business principles and the intelligent development of mines, rather than the discovery of new and rich bonanzas. Too much boom has been given to Shasta's unlimited advantages. Misrepresentations have been made and are being made every day. Some districts possess phenomenal adventages, while others are as wanting as New Mexico, or Arizona's most uninviting localities.

French Gulch.

The town of French Gulch is 15 miles north of Shasta, the county seat. During the early days of the camp's existence the place was like the average California mining town—"a dandy camp." The gulch in which the place is situated has produced millions, and until quite lately but little prospecting was done for quartz mines. As the richness of the gulch dwindled down to wages and grub, the miner either sought higher up on the hillside or left for new diggings. A number of gold quartz mines have been worked at a profit for some time past. Unfortunately, these mines were owned and handled by men of limited and in some cases very meager capital. The recent decline of stock gambling, the suppression of hydraulic mining and a boom in the legitimate has caused the healthy condition of French Gulch's present prosperity.

The Mines.

On the southeast slope of the ridge, along which runs the line between Shasta and Trinity counties, lie the mines and prospects now attracting so much attention toward French Gulch. The entire mineral belt, as well as mines of non-mineral bearing formation have been taken up and the capitalist who has enough money to buy one or more of these locations has sufficient to live without buying any mines. The Coleman group of mines is the most extensively developed at present and produces considerable bullion. W. T. Coleman, of San Francisco, is largely interested in this as well as adjoining districts. The Niagare is the principal mine of the group and has recently opened up in a highly satisfactory manner. Ore in quantity is exposed in a number of places, and as development progresses, encouraging results follow. A depth of 260 feet on the vein has been reached and the ledge shows from three to five feet in thickness. Ore stoping is going on in three levels of the mine. The vein matter is auriferous quartz carrying some sulphurets. Three classes of ores are produced running respectively, $80, $50 and $30 per ton. A 10-stamp mill with a capacity of 16 tons per day is operating on the Niagara ores. Four Frue Vanners are used in concentrating. The concentrates run from $200 to $450 per ton, and the tailings assay as high as $8.50 to $14. Steam power is used in running the mill and concentretore, as water is somewhat scarce as high up on the hill as these mines are located. The Coleman system of mines are working the Shafter and a number of other claims.

The Meyers mine adjoining the Niagara has some 350 feet of development in the way of tunnels, shafts and cross cuts. Two parallel veins in rather broken slate and porphyry formations is the result of development so far. The quartz is both firm and decomposed, and prospects high in gold with a small percentage of sulphurets. Owing to the irregular course of the veins and the broken conditions of the entire hillside the property is but a good gamble, one however, that bids fair to open up into a rich mine. The ore of both veins prospects well and runs so as to average about $30. A good body of manganese has been pierced by a cross-cut from one of the main tunnels. On the dumps of this property is 75 or 80 tons of rock now awaiting shipment to a custom mill near by for treatment. A 5 stamp mill with Duncan concentratore is talked of for this mine soon.

The Scorpion, next to the Meyers mine, is worked under a lease by Lawton and Higgins, with good results and a favorable outlook. The quartz vein runs nearly at a right angle with that of the Meyers property. The formations are slate and porphyry. The dip is almost perpendicular and the vein is in solid formation. Twenty-five tons recently milled averaged between $30 and $40 per ton. The present working of the mine is pushed on ore, and with a view of taking out every pound possible before the expiration of their lease.

The Highland group have resumed work and will push development extensively during the present season. A few Red Bluff people are interested in this group. The ore runs high in sulphurets and will be handled with a view of saving them. The owners of the Highland have no better prospects than when they abandoned their old workings, but are stimulated by the business-like methods and success of others near by them in the district.

The Subrants and Accident, adjoining the Niagara on the west, owned by Dr. Olendorf, James Gouch and others of Red Bluff, have a 200-foot tunnel in on one of their claims in search of the ledge,

John Souter, of the Washington mill, is doing custom work on district ores and is pushed to his utmost capacity to handle the trade. He has a 10-stamp mill, with two Frue concentrators. The mill is situated in the gulch just below the Niagara, a distence of three miles from French Gulch. This mill employs five men.

Messrs. Morrell and Wheeler, of French Gulch, are pushing development on a Summit gulch prospect.

The Queen of Diamonds is working a good force of men. This property is owned by Thomas Green, and has a cannon-ball mill and Dyer concentrator at work. The ore is high grade.

The Brunswick has shut down on account of water.

Work is being pushed on the Alexander, near the Green mine.

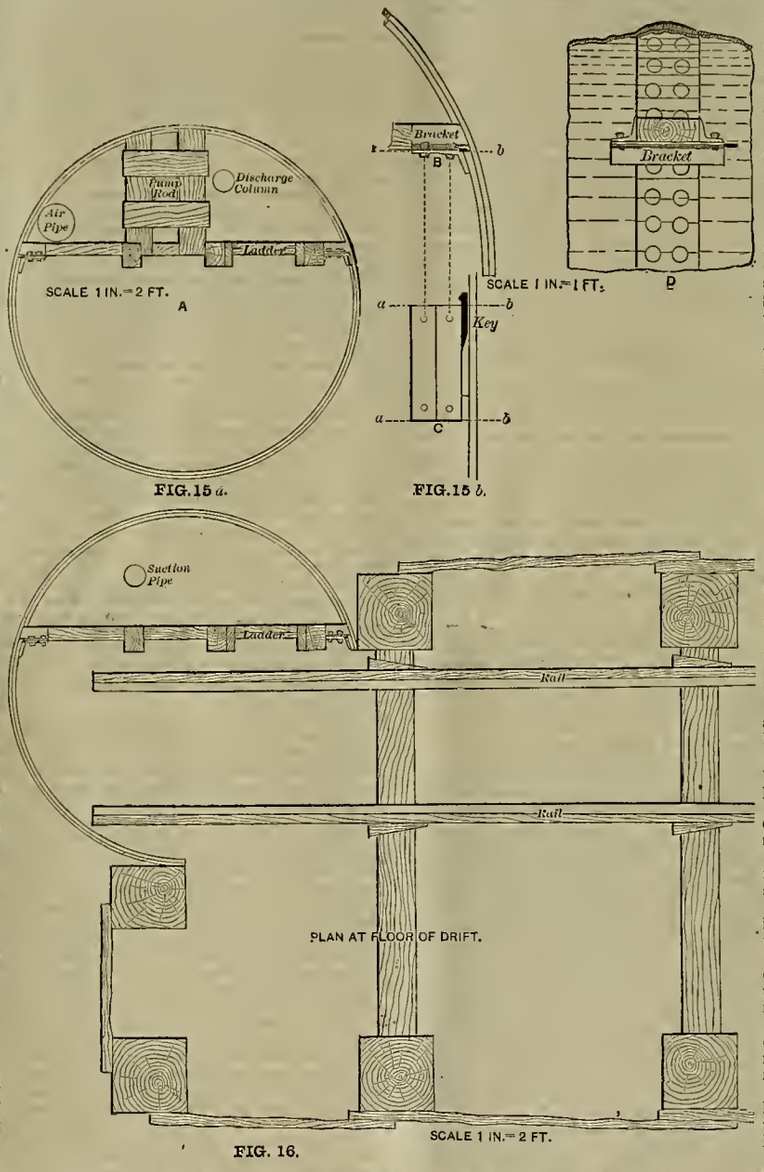
Phillips, northwest of the Niagara, is working seven men. His pay streak is a decomposed quartz and porphyry, with yellow, ocherish, soft rock, running from $5 to $25 per ton. Some 500 feet of development has been done on this property.

The Niagara people are laying pipe to carry the water from the Scorpion tunnel to their mill.

French Gulch Float.

One hotel.
No church.
Six saloons.
Scarce—enterprise.
Many pretty homes.
High—real estate and prospects.
Legions of lovely girls and some old maids.
Property is at high-water mark in this place.
The prosperity of the camp has improved wonderfully of late.
Toll-roads and exorbitant tolls are a drawback to Shasta county.
A telephone is talked of from Colemau's mine to French Gulch.
The proverbial mania for a mill before a mine is reging here now.
As yet, no depth worth while has been made by any mines in the district.
There are many prospectors hereabouts who are putting in their best licks to discover new bonanzas.
The majority of good paying mines are blind veins accidently discovered by running a prospect tunnel.
The camp is not infested by the usual supply of gamblers generally inflicted on prosperous mining camps.
Adjacent districts are profiting by the work now progressing so successfully in this district, and they are emulative accordingly.
The discovery of rich sulphuret ores is causing mine owners to investigate the merits of the various concentrators now offered for sale.
Men cannot go into the hills of this district on as a little money as many think who read the glowing accounts about frequent new and rich strikes.
The pay for miners is $50 a month and found, or from $2 to $3 per day. Wages are not uniform, owing to many small mines employing newcomers at reduced rates.
The stages from Redding to French Gulch leave both places and arrive after dark, the trip being made at night. The distance from Redding to French Gulch is 22 miles.
Experts and middlemen representing capital are numerous, and between their boastings and the imagination of the average mine owner, it is impossible to buy a prospect for anything like its actual value.
Strange at it may seem, miners with a few tons of ore on their dumps let it lay, and in some instances run in debt for grub and supplies instead of shipping it to a custom mill and making the mine pay its way.
Miners are flocking into the district in numbers that cause many to go out on foot. The place is already overstocked with prospectors of limited means. Capital is what is needed, yet harred out by high prices and misrepresentations.
French Gulch and Deadwood resemble the famous camps of Virginia City and Gold Hill as to location. The ridge along which the dividing line between Shasta and Trinity counties run also divides the mines of Deadwood and French Gulch.

F. W. S.



PLAN OF OPENING AND TIMBERS AT BEGINNING OF DRIFT.

Jerome district, 60 miles north of Prescott, Arizona, is said to have fine ledges of copper, silver and gold. The region is now being prospected.

The Bald Mountain placers, Nevada, have been shut down for the season, as the water gave out.

Auriferous Gravel in Arizona.

[Written for the PRESS.]

Perhaps the most extensive unworked beds of auriferous gravel on the Pacific Coast, between British Columbia and Mexico, are in Yavapai county, Arizona. This great county occupies the center of the northern half of Arizona and covers an area of 30,000 square miles, all included within the elevated plateau in which the greater portion of the Territory lies. This high table-land is traversed by a number of short broken mountain ranges, trending usually northwest and southeast. All of these in the southern half of the county are rich in minerals, principally gold, silver and copper. The general slope of the mountains from base of foothills to summits is very gradual, although in places the higher ridges of some of the ranges rise quite abruptly from the base hills, and the formation has been favorable for the deposition of vast gravel beds, as in the middle Sierra counties of California.

Placer Mining

Has been carried on in Yavapai for more than 20 years, but a comparatively small amount of ground has been worked, owing to the scarcity of water, although this county is more highly favored in that respect than others in the Territory. During the rainy season the mines most convenient to the water supply were worked so long as the latter lasted, and in many cases yielded enormously. It is not known that the average richness of the unworked placers is fabulously great, and probably they are not more so than were those of the El Dorado of the Golden State, but there are certainly large areas that would prove veritable honanzas were it possible to place them under a sufficient supply of water.

The Same Old Experience

Of other surface diggings has been repeated here. As soon as it became impossible to work the mines so as to make them yield to the very best advantage—due to expense of conducting water to them, or to a scarcity of the same—they were forsaken. Many of these same mines to-day will pay, and some are paying, good wages to those engaged in working them. The time has come here for the miner to be satisfied with reasonable wages. There has been very little enterprise shown in developing the placer mining industry, an important part of the natural wealth of this section. By constructing dams in suitable places and conserving the water in natural basins in the mountains where there is an over-abundance, the period of working the placers might be extended every year to at least two or three times the length of the rainy season—which in Arizona occurs during the summer—and in the more favored localities, during the twelve months. No large works of this kind, common in other parts of the west, have been attempted here. An outlay of many thousands of dollars would naturally be involved, but several localities might be named where such would prove a paying investment.

A few words relative to what has been done

In Earlier Days

Will be of interest, and a brief resume of such, mainly condensed from the accounts of a few of the principal districts as recorded in the "Resources of Arizona," published under the authority of the Territorial Legislature, will be given. One of the oldest districts is that of Lynx creek, six miles east of Prescott. The creek giving the name to the district has been one of the richest gold-producing streams in the Territory, and it is estimated that over $1,000,000 has been taken from the gravel beds through which it passes. They are still worked when water is obtainable in sufficient quantity. Of this district more will be said later. The oldest district in Yavapai, in the southwestern part of the county, "is famous as the scene of the discovery on Rich Hill. In a depression on the summit of the mountain, about 6,000 feet above tide water, the coarse gold was found lying on the bare bed-rock. Pieces of the pure metal, worth several hundred dollars were picked up, and over $500,000 was taken from about an acre of ground. Butcher knives were used to dig the gold out of the seams in the rock, and it was not an uncommon thing to find from $1,000 to $5,000 under a small boulder. How the gold was deposited in such a place is a mystery which has not yet been solved. The gulches and ravines running down from the mountain contained considerable treasure, and are worked by Mexicans up to the present time. It is estimated that Weaver has produced over $1,000,000 in placer gold." The Mexicans who still remain there

Dry-Wash the Gravel,

By which process a large percentage of the gold is lost, and were it not that it is very coarse they could not make it pay. As it is, they do very well, and during the short time that water is to be had to enable them to use the rocker or pan, often obtain such results as were heard of when placer mining was in its glory in California. Others in that district pack the gravel to water on donkeys a distance of five or six miles, and "pan it out" and make wages. Unfortunately, there are no large streams near the richest part of the Weaver district, and mining is carried on in the face of every disadvantage, and necessarily on a limited scale. Hassayampa district has also turned out a large amount of treasure, but less than the two above mentioned. These are the most notable placer districts, but there are others of less importance on smaller streams. Yavapai county has turned out more gold than all other counties in the Territory; but in the yield of bullion of all kinds the small county of Cochise, in the southeastern corner of Arizona takes the lead.

The Only Hydraulic Mine

In Yavapai county is in the Lynx Creek district, the property of F. M. Murphy & Brother. The gravel carries a large amount of gold, and the lack of a sufficient supply of water is all that prevents it from being one of the most valuable mining properties in the Territory. On this account it is worked only a short time each year during the rainy season, but for that brief period it pays well, the average yield of gold being 40 cents per cubic yard. The water is supplied through a 14-inch pipe reduced to six inches at the end. By constructing a reservoir and storing the water, the greater part of which runs to waste, the mine could be worked several months each year and made to turn out a large sum annually. The cost of making such a reservoir would be considerable but the increased yield from the mine in consequence of the extended period during which it could be made to pay would soon reimburse the owners for all outlay. The bed of gravel which is expected to yield at the rate named, 40 cents per cubic yard, is a large one, and it is calculated that if worked as long as practicable each season with the aid of a reservoir for the storage of water, would last for more than a quarter of a century. The possibilities of the surface mining regions of Yavapai are great, but a large amount of money must first be expended for the conservation of water and conducting to the mines. GEO. W. STEWART.

Prescott, A. T., June 2. 1885.

The Duncan Concentrator.

The Amador *Ledger* says: In a recent issue we made mention of the fact that three Duncan concentrators had been put up on the Amador Queen mine, to run in connection with a Huntington mill with reference to determining the ability of these machines to handle the ores of this mine. These ores, it is well known, are very base and difficult to concentrate, and therefore afford a severe test of the capacity of any machine. * * * We are glad to be able to state that the Duncans have been a perfect success, and under circumstances that leave no doubt of their adaptation to all this class of ores that have hitherto resisted successful treatment. The concentrates are certainly as fine as we have ever seen, and are claimed to be as close work as was ever done in this way. The subject of ore concentration is one of vital interest in this county, as well as in most other gold mining districts, from the fact that our ores carry about as much value in their sulphurets as can be saved by the ordinary process of amalgamation. The importance of such an appliance can therefore be readily appreciated, as the value of many mines is determined largely by what can be saved from these base products. Mr. Shugert, the manager, informs us that he has ordered eight additional Duncans for his new 20-stamp mill, now nearly completed, which with the facility afforded by this improved method of treatment, ought to add largely to our monthly product.

The Inyo *Independent*, speaking of concentrators, says: We made mention a few weeks ago of the experiment of Mr. Shanfield, at the Maxim mill, in the matter of concentration, and of the success that had attended it. Further experiments prove beyond question the practicability of this process, and demonstrate the fact that all of our low grade galena ores can, by a very inexpensive method, be put into a condition to smelt profitably at the mines where produced or for shipment to other points. The concentrators in use at the Maxim mill—the Duncan, made by the Pacific Iron Works, of San Francisco—though new to this part of the country, we learn have been pretty generally introduced throughout the State, working on gold sulphurets as well as galena ores, giving great satisfaction to parties using them. The first thing that attracts attention is their simplicity and absence of wearing parts, that make such machines so difficult to keep in repair. Then the fact that these machines adjust themselves so readily to all the varying conditions of the pulp, water, etc., without any appreciable loss of mineral. * * * The proprietors of the Duncan are to be congratulated on having perfected perhaps the most valuable improvement ever applied to the reduction of ores, and we feel sure that the miners of this, as well as other sections of the country, will not be slow to appreciate it. There are millions of tons of low grade ore in this county alone that by this method of reduction can be made to pay a handsome profit, and we expect to see these operations multiplied largely here, as well as in other parts of the country.

A RUSSIAN traveler predicts that Thibet will prove to be a second California, as during a recent visit there, he found the natives gold-washing in the crudest way, but with the richest results.

Transit of Jupiter's Fourth Satellite.

In March of last year the President of the California Academy of Sciences, Prof. Geo. Davidson, called attention to the observations of the black transits of the third and fourth satellites of Jupiter, made by himself and Messrs. Burckhalter and Hill. Since the publication in the PRESS of Professor Davidson's observations of the dark transit across the body of the planet much interest has been manifested in the appearance of these satellites: and an appeal has been lately made to astronomers who have observations of these phenomena. A special call before the Royal Astronomical Society has been made for all past observations. At the meeting of the Academy this week, Prof. Davidson transcribed from the memoranda of Mr. Charles Burckhalter of Oakland, his observations of the transit of the fourth satellite on the 21st of May, made with his 10½ inch reflector, equatorially mounted.

"At 7:25 I commenced observing, and was almost startled at the faint appearance of the satellite which was then about 15 seconds of arc from the limb of Jupiter. The first eye piece applied was a Huyghenian magnifying 215 diameters, and using the full aperture of the reflector. A Ramsden of about 90 diameters gave nearly the same result, but the faintness was more decided; and with a power of 640 the satellite was scarcely visible.

"The atmosphere was much disturbed and therefore the definition was blurred. Sat. IV gave about one-fourth as much light as Sat. I, and was insignificant as compared with III. I especially noted that satellite IV had a brownish color; something I had never noticed before.

"At 8:05 and 8:25 I made the similar observations with similar results, using powers from 90 to 320 diameters. The only change was in the growing faintness of the satellite, which was then about one-half the magnitude of a faint star 4' from the north, following limb of Jupiter.

"Numerous observations to 9:10 showed the decreasing light of the satellite, when it became an ash or grey color, and the satellite—now shorn of its rays—appeared decidedly elongated in the direction of Jupiter's equator. The length was apparently twice the breadth, and while I have little faith in this proportion, on account of the disturbed condition of our atmosphere, I am positive about the elongation of the satellites disk. But the most notable phenomenon was the smallness of the satellite, appearing one-third the size of satellite I, when in the same position near the planet's limb.

"The unsteadiness of the atmosphere prevented an accurate noting of the time of contact of the edge of the satellite with the edge of the planet, and my time may easily be one or two minutes in error.

"The satellite entered on the planet's disk at the upper edge of the dark equatorial belt of the northern hemisphere. At about 9:25 the second or inner contact of the two limbs occurred, and I carefully and anxiously watched for the possible dark appearance of the satellite.

"In five minutes after the second contact, I caught glimpses of the satellite as a *white spot*, after which it was invisible, but at 9:35 it was picked up as a dusky spot, but not at all dark. Making allowance for the brightness of Jupiter, the satellite might be called *dark grey* in color, but it was quite easily followed, although the definition was much blurred from increasing unsteadiness of the atmosphere.

"Leaving the telescope at 9:40 the observer returned at 10 and found the satellite as a *black spot*, but apparently two thirds smaller than before the transit."

From recollection the observer thinks that it was not so black as the transit observed in February 1884, but as it was in the present case within the dark belt at the equator, this may have detracted from its apparent blackness.

This observation suggests the possibility that the satellite has an area of white surface (say at one of the poles) and a remaining larger area of dark surface.

When the satellite approached the planet this white area was the visible part; but when it was well in, on the body of the planet, this white spot was lost in the superior brightness of the planet, but the dark area became visible; and the intermediate phases are accounted for on this supposition. It is a very great pity the satellite was not watched throughout the whole transit to detect its phases to the end. It might even lead to the determination of the rotation period of the satellite. The observation which Prof. Davidson made on January 15, 1884, shows the image of the shadow *black*, and the preceding disk of the satellite three or four diameters to the right is half *white* and half *black* but divided at an angle of 35° or 40° with the equator.

THERE is a great scarcity of good miners in this part of the county, and some of our mine owners have difficulty in getting a sufficient number of men. One reason of this is that good miners can do better work on leases than for wages.—*Mohave Miner.*

SEVERAL of the new discoveries in Lava creek district, near Wood River, have all the way from 50 to 100 ounce ore.

Calico Mines.

The Calico mines continue to yield a steady output of bullion, says the *Print*, which continues to increase gradually. According to the reports which we receive each week from Wells, Fargo & Co's office, the amount of bullion shipped is $1,359,946 since January 1, 1884. This does not include the returns from ore shipped to San Francisco, Pueblo or Kingman, nor from the Daggett Sampling Works which probably disposes of $6,000 or $8,000 worth of ore from chloriders every week, nor does it include the ore from the Sue mine which is crushed at the Waterman mill, amounting to probably $600 or $800 per day, nor the custom ore from Calico crushed at the Waterman mill. Taking the entire yield of bullion from the Calico mines on an average the amount can safely be estimated at $1,000,000 per annum.

The mines that are now in systematic operation, and are considered to be the principal mines of the camp are the Silver King (commonly known as the King), Garfield, Occidental, Bismarck, Silver Odessa, Sue, and such mines as the Blackfoot, Sam Houston No. 1 and 2, Humhug, Lone Star. Josephine, Snow Bird, Cuba, Burning Moscow, Gobbler, Veto, which are worked on a small scale, but are made to pay as they are developed.

Taking the mines on an average they are looking well, and are making improvements, and with an exception or two are operated in a legitimate and business like manner, being free from stock speculation and trickery. Owing to the hasty and discouraging reports in the early history of the camp by San Francisco experts, capitalists have been exceedingly slow to take hold of properties here, and the merits of the mines have but recently been recognized as worthy of notice by men of influence, who are not always practical mining operators. The lack of proper milling facilities has been a great drawback to the mines that are worked by chloriders, but the prospects of an improvement in this respect are becoming brighter, and we can reasonably expect that several small mills will be erected in the course of eight or ten months, and probably a smelter may be erected by that time.

The mines at Waterman, Alvord, Providence, Mescal, Ivanpah, Butte Valley, Kramer, Silver Lake and Soda Lake are in a most flourishing condition in proportion to the extent of developments, so that we can reasonably look forward to a considerable increase in the mining operations on the great Mojave desert within the next year.

Prospectors and Mining Bosses.

The Carson *Free Lance* says: Business men who are depending on prospectors to develop the country for them are liable to be disappointed. The prospector, like other mortals, considers his own interests first. There are several illustrations of this fact in the vicinity of Carson. At the Mountain House, on the Bodie road, Willard and McDonald are working a gold ledge. They have a miniature two-stamp mill, run by a water-wheel, on one of the mountain streams near the mine. They mine and mill about a ton of rock a day, and realize a profit of from $20 to $50 on each ton of rock so worked. When they need money, one of them takes gold bullion to the Mint sufficient for all requirements of their business, pays all bills and returns to work, happy and contented. They owe no one a dollar, and a mining excitement in their neighborhood would only be an annoyance. They are under no obligations to the public to create a market or to take their gold out of the mine and scatter it through the channels of trade. It is much safer where it is, and when their mine is worked out there will be no big mill plant on their hands.

In Red Canyon District, McKnight has a ledge where he took out about $1,000 with a hand mortar in one day last fall and now has a much larger amount in sight. He is working for the interests of McKnight.

Charley Knox has been working alone for years on a ledge about a mile north of McKnight's. During this time he has gone to his work many a day hungry and cold when potatoes were rotting in the cellars in Carson valley only a few miles below him, but people were waiting for him to develop the country so that they could sell those potatoes. Last December he found a rich chimney of gold quartz in his ledge and with a hand mortar soon had all that he wanted. Last Thursday he cut the same chimney of rich rock on a lower level and will probably lay away a few thousand dollars in gold dust, but, very naturally, feels under no obligations to those who saw him working hungry and cold to find his gold.

People who are depending on these prospectors for a mining boom will be disappointed. Mining booms do not originate in this way, especially in a camp where there is as rich rock as there is in Red Canyon and Silver Glance. If it had only a speculative value and was run on the assessment plan, things would be different.

An important strike has been made in the Paradise mines near Spring City, Nev. The strike is considered of great importance in Spring City, as it proves that rich ores exist in the district a mile and a half from the Paradise Valley, Bullion and Wild Goose mines.

Practical Mining.

A Two-Stamp Mill—One Ton a Day.

For some years past J. K. McDonald and M. Willard, two practical and very sensible miners in Silver Glance district, 34 miles south of Genoa, on the Aurora road, and about seven miles south of Red Canyon, in the same range of hills, have been prospecting and working a small ledge of free milling gold ore, and now they have it established on what might be considered a practical working and paying basis. They have a small two-stamp mill which they constructed themselves, run by water-power, and manage to reduce a ton of ore per day, on the average. They employ one man to assist them, and the three do all the work. The ledge is 18 inches wide, on the average, running about north and south, with a dip to the east, after the regulation Comstock style, and they have opened their mine to the depth of 140 feet. They select the best of the rock, reserving the rest for future reference, but, as may be easily seen and understood, they work at a profit, having very little expense. In the sweet by and by they hope to accumulate wealth enough to increase their number of stamps and mining facilities, and perhaps have a daily bonanza income, like Mackay and Fair. They have very little silver to contend with, therefore use no pans, but merely save the gold on amalgamated plates, etc. Mr. McDonald was in the city yesterday disposing of some of their bullion, and left for home last evening. These men consider themselves as doing well. Anyhow they are coming out ahead, and no thanks to any capital except what they take out of their own mine in the shape of pure gold, without any discount. They deserve whatever good luck they have, and many miners throughout the State, having the same facilities might follow their example to good advantage, instead of trying to sell out, or howling for capital to assist them.

The Minnehaha Company, composed of ex-Sheriff Swift and others of Carson, adjoin them on the south. It is an incorporated company with a valuable claim. In Minnehaha Canyon, two miles south, Beck & Co., a Reno organization, are working with fine prospects. Silver Glance district and vicinity shows many promising ledges, and many prospects which are liable to prove of considerable importance in the future mining history and bullion production of Nevada.—*Virginia Enterprise.*

FREIGHT FOR NEW RIVER.—The first shipment of freight from San Francisco to New River district, by way of Redding and Weaverville, arrived here this week, consigned to Thomson & Cohen. This is taken as an experimental trip, and the charges are a matter of much concern to shippers in that new and promising district. From San Francisco to Weaverville the freight is two cents per pound, and from here to New River the charge will probably be two and one-half cents, making a total of four and one-half cents for this lot, which is a small one. Experienced packers tell us, however, that if freight is shipped in considerable quantities—sufficient to keep a pack-train constantly employed during the summer—it can and will be packed for two cents per pound, making the total charge from San Francisco to New River only four cents per pound, and effecting a saving in time of not less than four or five days. While a round trip can easily be made from North Fork to the New River mines in five days or less, we are reliably informed that it takes 14 days to make a round trip from Arcata or Eureka. James Mullane will take in the freight now here, and has arranged to lay down Chico and Red Bluff flour at the mines for $5.50 per hundred. Flour from Scott valley and Eureka is selling at the mines at from $7 to $8 per hundred at the present. New River merchants can save time and money by having their San Francisco purchases shipped in care of B. & J. Redding, Cal., and if they make purchases in Sacramento can secure a still further reduction. As most of the provisions, tools and supplies required in a mining camp are of the nature known as "heavy freight," the matter of a cent or even one-quarter of a cent in freight charges is matter worthy of attention. The route via Weaverville is by all odds the shortest, quickest and cheapest, and all New River freight and travel should come this way. —*Trinity Journal.*

MINING LEASERS.—It is no unusual thing to hear miners say they don't want a lease of mining ground, says the Eureka *Sentinel*, because there is no ore in sight, or the mine has no record of ore shipped. There are cases in Eureka District where mine-owners have offered to advance grub and supplies, and their ground has been held in contempt. One man made good offers to several persons continually during the course of a year or more. One miner ventured, by a scratch, as it were, and was lucky in finding ore. Since then there has been a host of applications. The ground is let in square patches to a number of miners, and now there is no need to offer subsistence or aid of any kind. No more men are needed to take chances in the mine, and it is paying dividends to its several owners.

PRODUCTION of the precious metals in Mexico since 1493 amounts to almost $3,000,000,000, or about $1,000,000,000 for each century.

USEFUL INFORMATION.

TOUGHENED GLASS.—Mr. Frederick Siemens, at the London Society of Arts, has severely criticised the invention of M. De la Bastie, called "toughened glass."

The author stated in his paper on what he terms "Tempered Glass" that the French process was not a real manufacturing process, but an addition to known methods of glass-making. Articles had to be annealed first, and thereafter to be heated to such a degree as to render them soft; they were then immersed in a bath of heated oil maintained at a temperature of from 350 deg. to 400 deg. C. without evaporation. Articles so prepared were liable to burst suddenly into small fragments, either spontaneously or by sudden shock.

The author's own process consists of cooling the glass, not in proportion to its surface, but to its volume or capacity for heat. A sheet of glass of uniform thickness, having been heated uniformly to a sufficient degree, must be cooled on the surface of its two parallel sides, leaving the edges uncooled. The manufacture of hard glass depends, therefore, on the principle of uniform heating and cooling. The author has now made hardened glass at the Dresden Glass Works for six years; the output has steadily increased more than 50 per cent annually, from £600 value in the first year, until last year it amounted to over £7,000.

THE GOLD-BEATER'S ART.—If a sheet of gold leaf is held up against the light it appears to be of a vivid dark green color; this means that the light is transmitted through the leaf. When it is considered that this leaf is a piece of solid metal, a better idea of the extreme tenuity of thickness of the leaf can be comprehended than by any comparison by figures; nothing made by the hand of man equals it in thinness. This extreme thinness is produced by patient hammering, the hammers weighing from 7 to 20 pounds, the lighter hammers being first used. When the true method of this beating is understood, the wonder expressed sometimes that gold-beating should not be relegated to machinery ceases; the art belongs to the highest department of human skill and judgment. Apprentices have served a term, and have been compelled to abandon the business, because they never could acquire the requisite skill and judgment combined necessary to become successful workmen. As to the thickness of gold leaf, it may be interesting to know that 300,000 leaves, placed upon another, make a pile one inch thick. When laid up to the light, the leaf is so transparent that objects may be seen through it, that made for dentists throwing a blue shade when looked through. A fair year's work for a representative house is about 50,000 bundles of 500 leaves each. The workmen are mostly Americans, with some English and fewer Germans and Frenchmen.

TO CLEANSE A SOILED CHAMOIS LEATHER.—Many workshops contain a dirty wash leather, which is thrown aside and wasted for the want of knowing how to clean it. Make a solution of weak soda and warm water, rub plenty of soft soap into the leather, and allow it to remain in soak for two hours; then rub it well until it is quite clean. Afterward rinse it well in a weak solution composed of warm water, soda and yellow soap. It must not be rinsed in water only, for then it would be so hard, when dry, as to be unfit for use. It is the small quantity of soap left in the leather that allows the finer particles of the leather to separate and become soft like silk. After rinsing, wring it well in a rough towel and dry quickly, then pull it about and brush it well, and it will become softer and better than most new leathers. In using a rough leather to touch up highly-polished surfaces, it is frequently observed to scratch the work; this is caused by particles of dust, and even hard rouge, that are left in the leather, and if removed by a clean rouge brush it will then give the brightest and best finish.

A VALUABLE DEVICE FOR WARM WEATHER.—There is now being made, in London, by order of Government, an ingenious device, which will effectually protect the soldiers in the Soudan from the rays of the burning sun, and render an attack of sunstroke almost impossible. It is formed of light bamboo and paper, and may thus be described: On each shoulder is fixed a piece of bamboo, bent in the form of an arch; in the center of each arch a piece of bamboo, somewhat resembling an umbrella stick, eighteen inches in height, is securely fixed, and these sticks support a light awning two feet in length by eighteen inches in breadth; the frame of the awning is composed of bamboo, and the covering of paper painted green inside. The weight will scarcely be felt, and the wearer will thus enjoy all the comforts of a large umbrella, without experiencing the inconvenience of holding it up, and his hands will be left entirely free to carry his rifle or other articles. A device of that kind might be found useful for outdoor workers in the hot valleys of California. Who will introduce it?

A VALUABLE ENAMEL.—An enamel for artistic purposes, says a Dresden journal, may be prepared from a mixture of thirty parts, by weight, of saltpeter, ninety parts of silicic acid and 250 parts of litharge. Drawings can be made upon this enamel as upon paper, and the characters can be burnt in by means of a muffle in less than a minute. It can also be employed in the preparation of photographs without the use of collodion. For this purpose a mixture of ten parts of gum, one of honey and three of bichromate of potash, well filtered, is dried upon the enamel and exposed in the camera, the image being then developed by dusting over it a powder of ten parts, by weight, oxide of cobalt, ninety of finely pulverized iron scales, 100 of red lead and thirty of sand; the chromate is decomposed by immersion in a slightly acidulated bath. When washed and dried the enamel is melted by placing it upon a piece of clean sheet-iron, and coated with chalk, and the photograph glazed upon the enamel is then brought to view.

SHIP BUILDING IN NORWAY.—There are something like 800 men engaged in building iron steamers in one establishment in Norway. On comparing the wages paid at the yard in question, Mr. Raylton Dixon, a well-known shipbuilder of the Tees, estimates that upon a vessel of a given size the labor will cost 25 per cent less than that expended on a similar vessel built in England. Deduct from this advantage the freight on the materials used in its construction, which at the present time, with the exception of tinner, are imported from England, and the result is the Norwegian builder can turn out a 1,500-ton vessel more than $2,500 cheaper than his English competitor. The same authority further admits that as soon as the German plate mills are placed upon the same footing as those in England, which are laid out for rolling large quantities of ship plates, England will behold this trade slip away from her unless the workers will submit to still further reductions of wages.

THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—It is understood that the next meeting of the American Association will be held at Ann Arbor, Mich., on August 26th, and following days. It was the original intention to hold the meeting of 1886 at Bar Harbor, Me., but upon a full investigation it was found that the facilities which that locality could afford would be quite inadequate to the requirements of the association. The selection of Ann Arbor was made by the permanent secretary, to whose discretion the choice of place was left. The mayor of the city and the president of the University of Michigan have both extended cordial invitations to the association, promising their hearty co-operation and giving assurances that ample accommodation for the members will be provided.

FLEXIBLE LIMESTONE.—A limestone has been found in South Carolina so flexible that a layer of it can be bent in a circle when damp, and will retain its form when allowed to dry.

GOOD HEALTH.

Does Death Sting?

The function of dying is actually vegetative—we fall to pieces like a flower. This very fact, that the process is chemical, confirms us in the conclusion that the final "throe" is as painless as the inconvenience is nothing to the fœtal pilgrim when he touches on daylight. A moment's examination of the way we are to die will show marks of goodness in our "taking off." The degree of sensibility is proportioned to the integrity of the tissues. An inflammation heightens it; age depreciates it. Any defect in nutrition disturbs the comfort of the individual until the carbonic acid generated in the devitalization of the blood becomes fixed in the cells or is no longer displaced. The sensory ganglia everywhere part with their irritability by virtue of this poison, and cease to conduct currents. The criteria of death are being satisfied, and the process is consummated when this extinction of sensibility prevails at the ultimate filaments.

During the progress of this dissolution of the nerve force, this creeping on of the numbness of death, the individual is rapidly passing into a condition of repose, and instead of torture or pangs, a degree of self-satisfaction oft approaching to enthusiasm is realized. The sensations peculiar to the therapeutical operation of opium, hasheesh, ether, etc., are not improbably akin to the mental activities of the dying. Barring the hallucinations experienced in the stupor as it gained on the subject, the moribund is familiar with naught that borders on suffering. This carbonic acid has poisoned or narcotised the several ganglia, and reflex productions are interdicted. In short, the notion of pain is forbidden the instant that any stimulus fails to excite a response. The condition to this irritability is that the nerve center and the track be sound. If this vigor vanishes, reflex phenomena are at an end, and suffering, physiologically speaking, is impossible, because of the arrest of the function of the sympathetic.

Fortunately, for a wholesome study of one's demise, there are assurances abundant from vivisection, the testimony of those who have been restored to consciousness, and the affirmations of the dying that there is no physical recoil from death. Bruney tried hard to resist the efforts made to resuscitate him from drowning, so bewitched was he by his prolonged slumber. Dr. Solander, the traveler, was so delighted with the sensations of excessive cold that he was the first to lie down in the snow to realize the luxury of such a death. William Hunter was sorry he was not able to "write how easy and delightful it is to die." Infants die as serenely as they breathe, and not a few among the advanced in years treat death as a friend to their infirmities. Hanging is naturally rated, next to crucifixion, a most distressing procedure. But it is reported of those who have been saved from strangulation that the agony promised to be brief, and was rapidly replaced by hallucinations of a fascinating variety. One would fain believe that the kind God who suffered us to feel no sign in coming would take no delight in turning our farewell into writhing—nay, he does not quit us at the last. He is our greatest benefactor in allowing us to sleep out of weariness. Death is, assuredly, no tax collector; its "jaws" are not the clutches of an assailant; there is no "victory to the grave;" the ghost speeds away from us as it entered with no ruffle. The sense of death, as Shakespeare has it, is most in apprehension. It is the fear of the lonely night, not the throes of nature, that makes the leaving painful.—*Medical and Surgical Reporter.*

CAUSE OF PNEUMONIA.—Pneumonia, with rare exceptions, extends from the lungs to the lining membrane of the chest (pleura), and hence is really pleuro-pneumonia. Its seat is not the mucus membrane of the bronchial tubes, as is that of bronchitis; nor the general substance of the lungs, as is that of lung fever; but the air cells and the neighboring minute tubes (bronchioles), which are wholly destitute of mucus membrane. Sometimes it is almost an epidemic. It often attacks more than one member of ths family.

Pleuro-pneumonia among horses is a very contagious disease, and has sometimes gone through the land, bringing ordinary business to a standstill.

What is the cause of pneumonia? One medical writer says that "neither colds, bronchitis, pleurisy, asthma, or any other lung affection induces it; that, in a large proportion of cases, it is not referable to any obvious causative agency; that, when it appears to follow exposure to a cold, it is probable that this acts only as an exciting cause, co-operating with the action of a special cause."

What is this special cause? This question has received no answer until recently. German investigators of the highest character believe they have at length found it in a microscopic parasite, thus placing pneumonia among the germ diseases. The parasites are oval, generally go in pairs; and, unlike all others, enclose themselves—several together—in a capsule.

On cultivating them out of the body, insulating them in fluid, and injecting a little of the fluid into thirty-two mice, all of the mice died, in from eighteen to forty hours, of pneumonia, while the blood showed the peculiar parasites with their characteristic capsules. Experiments by means of inhalation exhibited the same results. Different investigators seem to have confirmed the discovery.

Later experiments show that the lungs of animals which have died of pleuro-pneumonia contain the same parasites in large numbers, and that the disease is essentially the same with pneumonia in man.

WHAT IS OLD AGE?—The *Medical and Surgical Reporter* of April 11th contains a curious article on the "Suspension of Old Age," the leading idea of which is that "the real change which produces old age is nothing more or less than a slow but steady accumulation of calcareous matter throughout the system, and it is owing to these deposits that the structure of every organ is altered; elasticity thus giving way to senile rigidity. Blockage of various organs thus commenced, and sooner or later a vital part becomes involved, and death of necessity follows." To delay this process the writer advises the avoidance of food containing this calcareous matter, among which bread is prominent. Moderation in eating is enjoined, and among the articles recommended are "fruit, fish, poultry, flesh of young mutton and beef, because, as before stated, of their being less nitrogenous. All well and spring water contains considerable of the earthy salts, and should therefore be avoided, and cistern water used in its stead, because water is the most universal solvent known. Therefore, if taken into the system clear of foreign matter, it is to that extent the better prepared to dissolve and take up those earthly salts and convey them out of the system. The addition of 15 or 20 drops of dilute phosphoric acid to the glass of water, and drank three times a day, will add to the solubility of these earthy salts."

WHY CONTAGIOUS DISEASES ATTACK BUT ONCE.—Professor Tyndall thus endeavors to explain the immunity obtained against a second attack of a contagious disease: "One of the most extraordinary and unaccountable experiences in medicine was the immunity secured by a single attack of a communicable disease against future attacks of the same malady. Smallpox, typhoid, for scarlatina, for example, was found as a general rule to occur only once in a lifetime of the individual, the successful passage through the disorder apparently rendering the body invulnerable. Reasoning from analogy, I have ventured to express the opinion that the rarity of second attacks of communicable disease was due to the removal from the system, by the first parasite crop, of some ingredient necessary to the growth and propagation of the parasite."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

TUNNEL.—Amador *Ledger*, 6: The contractor of the big tunnel at Middle Bar completed their contract Wednesday morning, making the distance over 2300 feet. The St. Julian one-stamp mill was started up again last Monday. The ten-stamp mill erected at Plymouth by John Evans has been started on the old dump-pile of the Alpine mine.

SUTTER CREEK.—Taking out the water from the Mahoney shaft is progressing favorably. There was about 300 feet of water when they commenced pumping; there is now about 100 feet in the shaft, with but very little tunnel below the water level. It will probably all be out this week. I am told that there are two or three parties with plenty of capital, anxious to inspect it, with a view of taking hold of it if satisfactory terms can be made. The McIntyre mine has come to a standstill. The developments fell short of anticipations, and prospecting has been abandoned. The company has expended considerable money in hoisting machinery, as well as underground work, and have apparently settled down to the conclusion that they have drawn a blank instead of a prize in the mining lottery. The Amador sulphurets works started up last week, with a fair supply of sulphurets on hand, with the prospect of an all-summer run before them.

Calaveras.

SOLD.—*Mt. Echo*, June 6: The Rasberry mine, adjoining the Stickle mine on the southeast was sold to Bechtel & Co., the other day for the sum of $4,000, and it is said that mining sales of much greater dimensions were consummated during last week. The company desire to purchase the mine owned by Mrs. Rice, adjoining the Rasberry mine. Preparations are being made to commence work in the Gold Cliff mine soon. Ten stamps have been added to the mill on the Invincible, making 20 in the aggregate. Look out now, for big results.

Inyo.

JUST THE THING.—Inyo *Independent*, June 6: About 100 tons of gold bearing sulphuret ore has been worked at the Maxim mill, to test the value of the Duncan Concentrator on that kind of ore. Mr. Stansfield says the success was greater with this than with the galena ore, highly satisfactory as that has proved to be. The working of the sulphurets is so complete that the yield of gold is very nearly equal to the assay value of the ore. Mr. Stansfield is now fully satisfied that with the Duncan Concentrator all the varieties of gold and silver ores found in Inyo county can be successfully worked.

INCREASED MILLING CAPACITY.—A new boiler is on the way from San Francisco for the Gavilan mine belonging to Cohen & Straus. The abundance of ore in sight in the mine fully warrants the owners in making this increase in milling capacity.

WATER SUPPLY.—One and a half miles of water pipe have been laid in Arastra canyon to supply water for Lasky's mill. This is a great improvement and will enable the mill to do much more work than formerly.

Mono.

BENTON.—Cor. Inyo *Register*, June 6: The Little Emily M. & M. Co., of Chicago, owners of the Laura and Eureka mines on Blind Springs Hill, paid off last week. This company, though a strong one, has been working only a small number of men during the past year, under the management of W. H. Russell, superintendent, and have most of their ore taken out on tribute or shares. They have a water-power two stamp-mill in Montgomery canyon which has been running for a couple of months; and if results prove satisfactory and the mines are placed on a paying basis, it is likely the company will push the work more vigorously. John Kremkow, with James Tregembo and Charlie Regli have purchased the old Kearsarge mine from August Mack. This was a good paying mine in early days, and large quantities of ore were taken out and shipped to Reno and San Francisco for reduction. The present owners are sinking a new shaft to strike the ore chimney on its southern dip, which was only followed about 150 feet in the old working. They have put up a new iron whim, and are now down about 100 feet. Since closing down last week, Mr. Millner has had the mill machinery overhauled and put in first-class order again, preparatory for another run. The mill starts up Monday on tailings. The driving power is a Corliss engine that used to run the old Comanche, and was one time condemned as worn out; but having been refitted and adjusted, it is now doing more and better work than it ever did before. It uses two and a half cords of wood where it used to take six, and running all the machinery—rock-breaker, five-stamp battery, four pans and settlers, and slum pump with steam to spare for the pans, etc.

Nevada.

BIG OAK TREE MINES.—Foothill *Tidings*, June 6: Mr. John Werry, the mining man of Colfax, was in town yesterday seeing about machinery for his mine, the Big Oak, near Colfax. Mr. Werry has been ill for some time, and has been entirely unable to attend to any mining business, but now he will be very active in that line. The Big Oak Tree is close to the Rising Sun mine, and is looked upon as a very valuable piece of property. The ledge is a very large one and already considerable ore has been taken from it and crushed, giving very satisfactory results. W. S. May, of Grass Valley, is engaged on the Big Oak Tree, erecting the hoisting works and pumping gear.

GOLD BRICK.—North San Juan *Times*, June 6: We saw at the store of Daniel Furth on Monday last a gold brick, the product of the Delhi mine for the month of May, which measured nine inches in length, four inches in width, two inches in thickness, and weighed a trifle over fifty-two pounds. Its value is about $10,400. The rock which produced this brick was taken from the 300-foot level, at which point the vein is eleven feet in width. Only the amalgamators were cleaned up. The mortars were not cleaned up, nor was the gold worked out of the sulphurets, of which there are several tons, that will yield at least $100 to the ton.

Placer.

THE MOUNTAIN GATE.—*Herald*, June 6: The old Mountain Gate drift mine, at Damascus, one of the oldest in the State, seems like good whisky, to improve with age. We are informed by a friend at Iowa Hill who knows, that for the month or four weeks ending May 23d, they took out 345 ounces and 9 pwt., worth $6,600. From the 23d to the 30th of May, they took out 97 ounces, worth $1,800. Their breast in the channel is 280 feet wide, and they take the gravel out from 10 to 14 feet bigh. They work only 20 men. The proceeds, according to the above figures, is about $13 a day to the man. It is in this same channel that the May Flower company are on, it is thought, some 20 miles or more below. Who can compute the amount of gold in a channel so rich, so broad and so long? The wealth of the Comstock in its best days only can compare with it.

Plumas.

MOHAWK ITEMS.—Plumas *National*, June 6: Mr. Thompson, of Alameda county, has a force of men at work taking out ore from his mine, and has contracted with Hapgood, Black & Co. for a test run of 50 tons in their mill. The Chamberlin, Flint & Co.'s tunnel is progressing slowly, having struck very hard rock. Hood, Neseman & Co. are pushing the Valentine tunnel. They have blasting rock.

San Bernardino.

CALICO DISTRICT.—*Print*, June 7: West Calico will soon be in the front ranks with its fine prospects and paying mines. Work on the Humbug is suspended for the present. Thousands of tons of low grade ore lie on the dump. The tunnel in the southeast end of the Gobbler is in about 70 feet and penetrates ore. The prospects of the mine are improving. It is reported that the Veto mine is opening up with a fine showing, and also the Sam Houston No. 1, under the management of H. T. Walker. The Silver Odessa is operating with the usual force of men, and is constantly striking bodies and veins of rich ore. From 10 to 15 tons of ore are taken to the mill daily, consisting principally of high grade. The Sue mines continues to show up well, and from 8 to 10 tons of ore are taken from the same daily to the Waterman mill. Sinking and drifting are progressing, and considerable prospecting is done with good results. Judge J. A. Owens has discovered a fine looking prospect on a claim that he recently located in West Calico, about 1,500 feet north of the Waterloo. We were shown a piece of good ore from the claim. He will proceed to open up the mine in good shape as soon as possible. He was offered $1,000 for an interest in the mine but refused. The Waterloo mine in West Calico, belonging to the Oro Grande Co., is looking well. An immense quantity of low grade ore is in sight that will mill at least $25 to the ton on an average, while chimneys of high grade ore are being opened that will mill into the hundreds, and occasionally into the thousands of dollars to the ton. Judging from appearances this mine will develop into a most valuable mine.

THE KERR MINE.—Messrs. Kerr and Patton have struck some very rich ore on their lower workings, and are putting some very high grade ore on the dumps. They now have an assayer on the ground, and are working their mine intelligently, as they know how ore goes by sampling daily. The Belle McGilroy group of mines are still working. The connection they have made shows a stope of ore for 125 feet; good looking ore all the way. They can now turn out large quantities of ore very fast. The Mozart group I understand are letting a contract to make a wagon road to their mines. This will be of great advantage as they can haul their ore for less than one third the price of packing. It is rumored that there is going to be a larger force put on these claims shortly. The Mescal mining camp has commenced to boom. About 20 pack animals of John Domingo are making daily trips from the Cambria mines to the mill at Ivanpah. I understand that the mill will start up under Barrett & McFarlane in about a week's time. Some old miners have taken leases on the old Ivanpah mines, and that section of the country is looking up again. Wilson Wadingham, the president of the Bonanza King Co., is expected here in a few days.

PROVIDENCE MINES.—Cor. Calico *Print*, June 7: Since my last, Caldwell's big ore team is making its regular trips. Everything is being pushed about the mill to start up as soon as possible. Mr. Hugn has gone to San Francisco to get some necessary machinery, and ere another week rolls by we will likely hear the glad sound of the stamps. The Bonanza Co. is taking out some very rich ore, and the dumps are being filled up. Miners coming in get work at once, and everything is looking up again. The assays of the first-class ore are as high a grade now as any time since the mine commenced work. Several contracts on the lower levels were let this week, and preparations are being made to put in new hoisting works with cages.

Shasta.

QUARTZ HILL.—*Courier*, June 6: The old Quartz Hill District four miles from here and on the east side of the Sacramento, bids fair to prove as rich in gold quartz as was anticipated by the enthusiastic men who first found gold croppings on the numerous ledges there a quarter of a century ago. The principal land-mark of the district is a huge pyramid of white quartz covering many feet of surface and towering above surrounding objects. The earth's surface for a great distance around the base of this pyramid is strewn with quartz rock, and the surface or placers worked in the vicinity paid enormously. At different times attempts have been made to work the quartz of the district, but heretofore little success has attended these efforts, either on account of the inexperience of the parties or the lack of sufficient capital to go ahead and develop their ledges. The failure of the Mammoth mill there twenty years or so ago, was due to the combined causes of lack of knowledge as to handling quartz machinery, and want of funds on the part of some of the stockholders. Parties are now at work and figuring in the district, through whose efforts, we have good reason to hope, the long delayed success will come, and Quartz Hill stand forth as one of the most prominent bullion producing districts of the county.

Sierra.

DAM.—Sierra *Tribune*, June 6: Dr. Thompson has constructed a dam which effectually impounds his debris. Water is getting scarce and he expects to clean up a nice sum, which will well repay him for the season. An Oakland company is operating on Howardc reek. Mr. Williams is superintendent. An incline shaft is sunk 110 feet to the bed-rock. The indications are favorable. A water-wheel and other machinery is doing effective work on the claim. Mr. Whitney has the contract for hauling logs to the Sierra Buttes mine. Men and team are already in the woods. At present they are felling trees, repairing roads and performing other necessary work before they commence hauling the logs to the brow of the hill near the mine.

Siskiyou.

FROM KLAMATH RIVER.—Cor. Yreka *Union*, June 6: A few lines from this mining camp on Klamath river may prove acceptable to some of your readers. There are in all six companies preparing to operate in the bed of the river. They have been busily at work the past two months building their dams and fixing up their machinery for hoisting and washing, and the work is now so well advanced that there is a good prospect that all will have commenced on or before the middle of June to take out the precious stuff. From last fall's prospects it is confidently hoped that the coming season will prove a prosperous one to the miners. A couple of miles farther up the river is two large China companies starting in, one on the Freshouer bar and the other on the Lime gulch bar. Above them about a mile comes the celebrated McConnel claim, below Humbug, which is already in full operation. As all of these companies, when they commence washing, work a good many men, from 12 to as high as 50 each, the camp has a busy look through the season. I will state that the hired help will be mostly Chinese.

SALMON ITEMS.—About three weeks since Mr. Lovejoy discovered, on Summer trail from the South fork of Salmon to Hoopah valley, a ledge of gold-bearing quartz, which is said to be from 65 to 70 feet wide, and will pay from $8 to $15 to the ton. There is a good water privilege within a good quarter of a mile from the ledge. The trail, which in early days was used as a pack trail, crosses the ledge, and it is strange that so large a body of quartz should remain undiscovered so long. It is situated about one mile and a quarter on the other side of the Siskiyou county line, in Trinity county. If this report be true the Salmon country will soon be the banner section, and will be thronged with prospectors from all sections of the country. At present there are some 30 men on Methodist creek, mainly prospecting for quartz, and three ledges have been struck. One of them the old Indian ledge, has been struck 900 feet below the summit, and is two feet in width, and prospects well. On Plummer creek Mr. Donaldson and others have a nice ledge which goes from $35 to $40 to the ton, and is improving as they go down on the ledge. Mr. Donaldson informs us that, in his opinion, there is better prospect for finding good paying ledges on this side of the summit than have or ever will be found in the New River section. At the Black Bear mine they will soon put on a few more men to get out 200 tons of quartz.

Trinity.

VIEWS ON NEW RIVER.—Trinity *Journal*: Leaving Eureka, Humboldt county, for the New River mining district, the traveler proceeds by boat and rail a distance of 25 miles, and then by trail to the mines 80 miles further. The trail on this route is a difficult one, and aside from being poorly laid out is easily lost in many places, on account of many other trails running to the right and to the left. Although we were disappointed in not finding greater excitement and more business in the New River section, yet on inquiry it was found that a combination of circumstances contributed to this quietude, and it was not because of any lack of paying ledges or good discoveries. The district is laboring under the same difficulties which some of the richest districts of the coast have passed through. One is the want of capital, and another the desire on the part of many to gobble up the whole country, making innumerable locations and doing no work on them. While scratching on the surface and sinking a few feet is plentiful, the developed and paying mines are few. Those men who discovered ledges and went to work on them in true mining style have in every case developed paying mines and been well rewarded for their labors. The formation of the country is granite, porphyry and limestone, and in many cases contact veins are found, that is veins lying between two formations, and these are almost always the most permanent and richest. The ore for the most part is gold-bearing quartz, easily extracted and easily milled. The veins are not large but in several instances very rich. In size they vary from a few inches to four feet in width. Never in a mining district have we seen richer white quartz than is here shown. When proper attention is shown to the many ledges existing in this district, a grand future will be opened up for it. At present there are not many mines being worked, nor many men employed, and as a consequence the settlements are rather dull. The country, however, is full of prospectors and new strikes are frequent. Many go there for the purpose of preying on the earnings of the miners and come away disappointed. This class always gives the place a hard name. The principal mines in operation are the Hard Tack, a true fissure of good size and carrying very rich ore; the Uncle Sam, with a 5-stamp-mill and arastra attachment; the Mary Blane, an extensive property employing 16 men and running a 5-stamp-mill day and night; the Ridgeway, a very promising mine now crushing ore at the Uncle Sam mill; the Grover Cleveland, on Eagle creek, is fast coming to the front, and there are many other good locations awaiting developments. Miles Finlen, formerly an official of Virginia City, Nevada, is at White Rock running an arastra for the purpose of testing ores, and will ere long erect a stamp mill if the ore from the various mines justify it. Taking all things into consideration, there is a bright and promising outlook for the New River region, no matter what disappointed croakers may say. Taking the trail at White Rock, which leads over the mountain by the Mary Blane mine, we reached Weaverville by easy stages. This trail has been lately built, and is the best mountain trail we have ever traveled. The distance from New River to Weaverville, over this route is less than 50 miles, and 43 miles from Weaverville to the railroad at Middle creek, a station near Shasta. This is by far the most easy and available, as well as cheapest route to or from the mines. Notwithstanding mining has been carried on in Trinity county for more than 35 years, it may be said to be in its infancy. There is plenty of gravel rich in gold that has not yet been touched. Vein mining has been little sought after until within the past few years, and is only now beginning to assume the importance which its richness and extent should long ago have commanded. The country lying between Weaverville and New River is not equaled in California as a field for the intelligent prospector. Mammoth veins crop out in abundance all along the route, and as the beds of the streams have all paid for sluicing it stands to reason that the ledges of quartz which over-top them should also be rich. Yet but little attention has been paid to the prospecting for veins.

NEW RIVER MINES.—Grass Valley *Union*, June 6: Frank Taylor returned from a trip to the New River mines, in Trinity county, on Friday evening. He went by way of Redding, taking a riding and pack animal. He found that there were about ten quartz mining operations going on in the district, one company having a 5-stamp-mill, the others reducing their rock with arastras. About 5,000 people had been in the district, first and last, and some hundreds at the present time. The country is exceedingly rough, being broken into canyons, with scarcely any level land. New River heads in Scott Mountain, and on the broken sides of this mountain the mines are situated. The houses that have been put up are generally substantial structures, built of sugar pine, as owing to the heavy snowfall it is necessary to make them strong. As much as 15 feet of snow falls in winter. The quartz ledges are generally small, about 6 inches in width, and although ore of fair quality in some of the veins has been found, the opinion of experienced vein miners is, and they are there from nearly all the quartz districts of the coast, that the mines will not amount to much, and that the whole excitement has been engineered by the coast towns, Arcata and other places, to make business. Mr. Taylor's opinion is that the New River mines are a fraud, in the sense of being such as to encourage people to leave other places to go there, and that right here at home there is a better field for prospectors, and more chances of opening good mines. His advice is to keep away from New River. It is an undeveloped and very rough country, expensive to live in, and no place for those seeking employment by day's labor at mining.

Tuolumne.

SOUTH END OF THE COUNTY.—Tuolumne *Independent*: Mr. Fischer is still operating on the Butler mine at B. O. Flat. He has a shaft down some 60 ft. and expects to strike the vein shortly. The Blue Lizzard at Groveland, is still paying quite well. Messrs. McLain and Miller recently took out a large pocket, near Spring Gulch.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, June 6: On the 3,000 level the principal work being done is the chambering out a station in the 15-foot ore vein cut through by cross-cut No. 2, west. This will be completed to-day, and sinking the winze commenced, to follow the ore vein below that level and ascertain its true merits. A very fine face of ore is developed for a starter, that shows well in rich bunches and streaks of black sulphurets, and the whole will average $60 or more to the ton. This is being taken to the surface as fast as extracted, or when the hoisting facilities of the Combination shaft will allow, and will be continued. About 40 tons of ore are on the dump already. It has been several years since pay ore bas been hoisted from the Hale and Norcross. No trouble is anticipated from water in this deeper sinking, as the pumps have full command of the situation and keep the water reduced with perfect ease. On this same level cross-cut No. 1 west is in 140 feet, and shows a vein of fair grade ore cut through, about 15 feet in width, showing spots of ore giving high assays. This will be drifted laterally upon shortly in order to ascertain its merits as a good paying proposition. The main lateral drift north on this level has been advanced 40 feet during the past week, and its face is about 150 feet from the Savage line. Nothing doing on the 2,900 level. On the 2,400 level the spacious new air gallery is in 100 feet from the main incline winze, and 60 feet further will carry it through to its connection with the northwest drift running to the Savage incline. This will take about a week, when the much-desired and required circulation of air will be established.

CON. CALIFORNIA AND VIRGINIA.—The stopes on the 1 700 and 1,750 levels continue their liberal output, nearly 700 tons being extracted during the past week, assaying about $15 per ton as against $22 per ton the previous week. The main lateral drift north on the 1,700 level is being extended at the rate of about 45 feet a week in favorable working ground. From the Jones lease section, between the 1,200 and 1,550 levels, over 100 tons per day are being extracted, assaying $18 per ton. The old Con. Virginia shaft was turned over to Jones yesterday morning, together with surface machinery, etc. The shaft has been partially repaired, sufficient for ventilation purposes, and it may be put in order for hoisting if found requisite. Rumors of strong improvement in this mine have been prevalent during the past three or four days, confirmed by the sharp rise in stock, but denied by official authority. The average ore assays show the reverse of improvement.

CHOLLAR.—On the 3,000 level the main south lateral drift is being extended, and when the proper point has been arrived at, it is the intention to start another cross-cut, No. 4 west, to intersect the ore vein further south. Cross-cut No. 3 is still advancing in mixed vein matter, clay and quartz, with spots and streaks of ore.

BEST AND BELCHER.—On the 1,000 level, the Gould and Curry and Best and Belcher joint east drift is progressing at the rate of about 50 feet a week. The main north lateral drift on this level is being put in good state of repair.

OPHIR.—The upraise above the 500 level, to connect with and drain the old Mexican shaft, is up 60 feet, and the joint cross-cut of the Ophir and Mexican, on this level, is making good advancement.

WOODVILLE.—On the 400 level, five or six tons per day of good paying ore are being extracted. It is proposed to run a drift from this level into the Justice mine for ore explanation at that point.

CROWN POINT.—The old stopes continue their regular yield and show no sign of exhaustion. The

same may be said of Belcher, which is worked through this mine.

ALTA.—Good bunches and stringers of ore continue to be met with in the explorations and upraise above the 950 level. This upraise is in the foot-wall and extends to the 800 level.

OVERMAN.—On the 226 level a considerable amount of low grade ore is found, and about a dozen tons per day is being extracted through the old Petaluma street tunnel.

MEXICAN.—The joint Mexican and Union drift on the 500 level and also the west cross-cut from the main north lateral drift on that level, are both making good progress.

YELLOW JACKET.—Extraction of low grade ore from the old upper workings goes on as usual, the stopes and breast looking and yielding well.

BULLION.—The main drift west on the 160 level is progressing well in good working ground, with favorable ore indications.

KENTUCK.—Ore extraction from the old upper levels continue as usual.

Columbus District.

MOUNT DIABLO.—*True Fissure*, June 6: The west drift on the sixth level has advanced 15 feet during the week, and the winze from the west drift on the fifth level is now low enough to met this drift. Consequently work has been stopped until connection is made with the sixth level. The east drift on the sixth level is in 51 feet, and the east drift on the fifth level is in 139 feet. The stope above the west drift on the fifth level is looking well. The intermediate stope, between the fourth and fifth levels, shows a strong ledge of $60 ore. The north cross-cut from the west drift on the fourth level is in 28 feet. The west drift on the third level shows a foot of $100 ore and looks well. The stopes between the second and third level shows no marked changes. Some very rich ore is being taken from small streaks between the first and second levels. The remaining portions of the mine show no special changes.

Eureka District.

LOCAL NOTES.—Eureka *Sentinel*, June 6: Considerable prospecting work is being done in the mines on Adams Hill. Prospect mountain properties are attracting quite a number of tributers just now. Several new leases of mining properties in various parts of the district have been made to miners lately. The Jackson mine on Prospect mountain sent down to the Eureka Con. works during the past week 26 tons of ore. The Lord Byron mine in Prospect mountain shipped 16 tons of ore to the Richmond works during the past week. The Dead Broke mine on Prospect mountain made a shipment of two and three-fourths tons of ore to the Eureka Con. furnace last Thusday. The Blue Ruin mine in Silverado has again commenced shipping ore, and during the past few days five tons were sent to the Richmond furnaces. The Mathewson Bros. brought in from some properties near Hamilton to the Eureka Con. works five tons of very good ore during the past week. A shipment of seven tons of ore was made to the Richmond works during the past week from the Monte Cristo in Robinson district, White Pine county. The prospects of the Silver State mine on Prospect mountain developing into a producing property of no mean proportions are said to be flattering. Maurice Hartnett made a shipment of one and a half tons of ore from the Industry mine on Prospect mountain to the Eureka Con. reduction works the other day. The Dunderberg mine on Prospect mountain continues to look well. A shipment of five tons of ore was made during the past week from the property to the Richmond works. The Alexander mine in Prospect mountain has made some very good shipments of ore to the Eureka Con. works during the past week. Since Monday last 32¼ tons were shipped. Some of the pitches in the Albion mine look well, and several of the new tributers working in them shipped to the Eureka Con. works during the past week nearly 20 tons of very fair ore. Several of the mining properties in Newark valley are looking and producing well. During the past week the Bay State shipped 19 tons and the Scasso also made a shipment. Both shipments were to the Richmond. Several weeks ago the Silver Connor mine on the west side of Prospect mountain took the lead of ore-producing properties in that section, and since then it has maintained its stand nobly. During the past few days 56 tons of ore was shipped from the property to the Richmond works.

Osceola District.

GOLD DIGGING.—Salt Lake *Democrat*, 6: Mr. John Reeves, general agent of the Utah Central, has returned to Salt Lake from a two weeks' visit to the mines of Osceola and Taylor districts, Nevada. Upon inquiry a reporter learned that the Osceola Gravel & Mining Company are working extensive gravel beds of placer gold by the hydraulic process, with apparent great success. In the same grounds placer mining has been carried on by the panning and rocking processes for some years, and there are yet a number of men following the old primitive methods. There are also quartz mines in the vicinity of the gold gravel beds, which are yielding good ore, with prospects very promising. One quartz mill about two miles from Osceola, is being put in shape for active work. It is reasoned that if a single man by the old rocker process can take out from $5 to $10 of gold per day, what will be the limit of the company with their modern hydraulics now working six nozzles, and using twice over the continuous supply of water from the large 14-mile canal. Surely immense wealth lies in store and an undoubted source of great profit is guaranteed each member of the company. Large nuggets are found frequently, one weighing 24 pounds having been found which averaged $17 per ounce. The gold is of good, pure quality, assaying high, and easily obtained since the full head of water has been secured. The company in which Messrs. Godbe and Hampton are interested propose to rush matters from now on.

Tuscarora District.

BELLE ISLE.—*Times-Review*, June 5: West cross-cut, 350-foot level, is passing through a favorable formation, and was extended the past week 14 feet. North drift on the west lateral, 150-foot level, advanced 8 feet; total length, 75 feet.

GRAND PRIZE.—The 200-foot level south has been extended 17 feet during the week. The upraise above the 200 is up 55 feet. The 300-foot level has been extended 30 feet during the week, and the upraise above the 400 is up 86 feet. Progress for the week, 48 feet. Stope above 200 looking well. Mill will start up in a day or two, as soon as the pans are ready. Everything else is ready.

NAVAJO.—Drift south and cross-cut east on the 650-foot level have been extended 46 feet. Upraise has been carried up 31½ feet. On the 350-foot level the drifts have been advanced 63 feet. West cross-cut, 150-foot level, extended seven feet—total 193 feet—and work suspended for the present, on account of the indications of a strong flow of water. In the Johnson cross-cut east, same level, a drift has been started north, for ventilation, to connect with the drift that is being extended south on the east vein.

White Pine District.

MILLS.—White Pine *News*, June 4: The mills are being run with as light forces as can possibly be got along with. Not near the number of men are employed that were last fall.

ARIZONA.

SILVER ORE.—Prescott *Courier*, June 5: Wm. R. Morgan has just brought to Prescott another lot of rich silver ore from the Pine Spring mine. Supt. Chase worked 80 tons of the Wonder ore, in one of his mills. Result satisfactory. Messrs. Roach and Holmes, have $20,000 worth of ore that will pay between $400 and $500 a ton, ready for shipping to Pueblo, Colorado. It is said that Mr. Eaman proposes to work the Black Warrior mine, Peck district. The 10-stamp mill recently erected near the head of Big Bug creek, for Mr. Scofield, by Messrs. Church and Gray, is doing excellent work. There is no attempt at battery or plate amalgamation. The pulp goes direct from the stamps to a long tank, where it is separated by the action of water and carried to jigs and shaking tables. Different ingredients go towards the tailing pile by different routes, but the valuable portions of the rock are saved in pans. Tests go to show that but little of the gold goes into the tailing pile. The mill is not a costly one; but it is, nevertheless, just what is needed to treat certain classes of Big Bug ore.

COLORADO.

SAN MIGUEL.—*Journal*, June 4: Notwithstanding the past winter was a comparatively mild one, yet the spring opens late, owing to continued severity of the storms since March 20. But, at last we are able to announce the resumption of mining in earnest, and the shipping of ore, and from observations we feel no hesitancy in predicting for the San Miguel an extraordinary prosperous season. Corporations have experienced no difficulty in securing ample funds to prosecute the season's work, without cessation, and before snow falls again many more paying mines will be listed from this section. So far, the principal paying mines are those of Marshall basin, but there are, in adjacent basins, many others equally as good, particularly those of Ingram, Bridal Veil and Bear Creek. In Marshall basin work has been prosecuted with reasonable diligence, although the number of men employed, and the work that has been accomplished is nothing in comparison with what is contemplated for the summer. In this basin are some of the best mines in the State, in which are exposed thousands of tons of high grade mineral. During the winter, owing to a want of ore houses and other facilities for handling and sorting the mineral, it has been left standing, no more being removed from the mine than was absolutely necessary. In Ingram basin are located, and partially opened, some of the most extensive bodies of galena in the San Juan. The ore is quite low grade, and would not permit of shipping heretofore, but will pay handsomely with our reduced cost of transportation, as the immense veins necessitate the handling of no waste dirt. In Bridal Veil are several properties that will produce ore this season. A greater part of the locations in this basin were only recently made, yet, with a small amount of work done enough has been demonstrated to very clearly establish the fact that those who own property in that section will reap a rich reward for the time and money expended in their search for it. Bear Creek will be unusually active this season, and in all probability the year around hereafter, as there is no occasion for shutting down work as soon as the first snow falls.

BRIEF NOTES.—Georgetown *Courier*, June 5: A streak of 700-ounce ore has been struck on the Saco lode. W. C. Roberts and Jake Blair, on the Blue Bell lode, Kelso mountain, are taking out some good ore from the 30-foot adit. D. R. Holbrook commenced work last Monday upon the Detroit lode, Kelso mountain. He intends driving the 290-foot level ahead. There is a two-inch streak of mineral in sight which runs from 200 to 600 ounces. Peter Divinney and brother brought down 56 sacks of ore from the Astor mine last Saturday, which was extracted in development work near the tunnel level. The first-class returned 960 ounces, second-class 270 ounces, and third-class 70 ounces silver per ton. A 280-foot cross-cut is to be commenced soon to cut the Josie Meeker vein. The lessees on the Wolverine have from two to four inches of ore in their stope. Three parties of lessees are engaged on the Nyanza mine. Lacy & Co. are sinking a shaft 500 feet from the mouth of the adit, and are down 40 feet. From one to two inches of fine mineral is exposed in the bottom. O'Connell & Co., 100 feet farther west, are also sinking, and are down 75 feet. They are taking out 267-ounce ore. Ray & Co. have from three to six inches of high grade mineral in the 60-foot level. Cooper & Co. are taking out large quantities of mineral from the Lucky-Hesperus. McVeaty & Co. are drifting on from three to six inches of rich ore in the Fred Rogers. They are building a new ore-bouse at the mouth of the tunnel. A fine specimen of ore, weighing 125 pounds, was recently taken from Owsley's lease on the Cascade. Large jack-trains are kept constantly employed conveying ore from Cascade district to market, and although every available animal is at work, the force is not sufficient to handle the output of that section. The cross-cut being run on the Summit will intersect the shaft in a few feet. A dam is being put in at the mouth of Hukill gulch for the placer mining purposes. Harris & Kelso, who have been crosscutting for the Flagstaff lode, have passed through a porphyry dyke into a mineral vein.

IDAHO.

THE ELMER.—Wood River *Times*, June 3: George H. Merrill came in from Smoky yesterday, bringing for assay samples of carbonate and galena ore carrying native silver which he procured from a ledge on the Galore belt, below Pierce Dorgan's claims. This ledge was discovered about two weeks ago, and located by Abrahani Bellin, Anton Ellexson, and George H. Merrill. It crops out on the surface, quite prominently, carries three feet of pay ore, of which a streak of 15 to 18 inches is rich. Mr. Merrill says the croppings must have been seen before, but that the value of the ore could not have been ascertained by those who saw them, or the claim would have been located. The owners of the Elmer that is the name of the claim—will begin shipping ore soon after the Smoky wagon-road shall be completed.

ENORMOUS ORE-BODIES LYING IDLE.—Eph. Daft and wife returned this morning from their visit to the Lava and Blackburn mining districts. The Martin mine, in Lava district, shows enough ore already to make its owner independently rich. The Blackburn district mines show up an enormous width of ore-vein, with large quantities on the dump.

ANOTHER IMPORTANT STRIKE.—Wood River *Times*, June 3: News comes of another important strike on the Horn Silver belt, out in Lava or Champagne district. It was made on the Rattlesnake claim, which is situated about 3000 feet south of the Horn Silver or "Martin" mine, as it is generally called, and promises to fully equal the showing of that famous property. The Rattlesnake is owned by William H. Walker, A. W. Crawford and Wiley Jones.

A GOOD REGION FOR PROSPECTORS.—M. J. Calnan, a well-known prospector, was in town last Saturday from the Soldier Boy and Silver Crown group of claims, on the East Fork of Wood River. He has done over $8000 worth of work on the claims, and has a good deal of ore in sight—from which he will drew in future for development funds. Mr. Calnan belicves the East Fork to be the most favorable locality in the northwest for prospectors.

THE HORN SILVER MINE.—Yesterday afternoon, Mr. Martin, owner of the Horn Silver mine, showed Geo. W. Faylor a dispatch which stated that the examination of his mine was satisfactory, but Mr. Faylor does not know who signed the dispatch, nor whether it ment that the sale which has been under way would be consummated. Two well-known mining men have visited the mine during the past three weeks in the interest of syndicates of mining capitalists. One was Pat Mervin, ex-Snperintendent of the Ontario mine, who came in the interest of the Chambers-Gilmer & Salisbury-Haggin-Hearst crowd; the other was Colonel Hardy, formerly superintendent of the Ophir and other leading mills and mines of the Comstock, who came in the interest of the Alvinza Hayward and W. S. Hobart crowd, of San Francisco. Both expressed the opinion that the mine was a valuable one. But which of the two it is that telegraphed yesterday is not known. The price asked for the property is stated to be $275,000.

MONTANA.

BANNACK MINES.—Cor. *Inter-Mountain*, June 5: The Blue Wing property improves with depth, and continues to ship a large amount of from 100 to 300 ounces silver ore. Mr. Hays has purchased the old smelter and grounds above town, and expects to have a water jacket furnace working by the 10th of July. The Czar mine, owned by John Stigirs & Co., is being worked by leasers, and they are doing well. The Charter Oak mine has a fine showing of rich mineral. The Carolina mine, on Steel creek, has been leased and bonded to some Butte gentlemen, who are now working a number of men on good pay. The old Huron mine is again producing a quantity of high grade ore. Coloradoans are becoming numerous in this camp. Three different parties visited the Lost Cloud mine, near Bald Mountain district, the first of the week with a view of purchasing. Phil Shennon got away with the cake. Considerable prospecting is being done in Elk Horn and Bald Mountain districts. John Carhart and Phil Shennon's stamp mills are running on gold ores. The Ruby mine, owned by F. L. Graves & Co., has started up. The Silver Rose mine, owned by L. Hamilton & Co., is producing a quantity of good mineral. About 1,300 sacks of ore have accumulated at the Polaris, Silver King and Lost Cloud mines, in Bald Mountain district, owned by Dr. Meade and Cochrane & Co. James Harby has purchased the Cumberland mine, and will open it up.

NEW MEXICO.

GRANT COUNTY MINING.—Deming *Tribune*, June 6: Amos Green is here from his mines at Pyramid. He is making arrangements to ship his ore here to the Pueblo Sampling Works. Jimmy Hough leaves to-day for his mine in the Tres Hermanos district, where he proposes to pass the summer getting out ore for market. Mr. Orr is in from his mine at Cook's Peak. He has been shipping considerable carbonates of late. His ore seems about 50 per cent lead and about fifteen ounces silver. Albert Taylor, who recently purchased the Gen. Hancock mine, in the Tres Hermanos has sold a quarter interest in the mine to some capitalists in Rock Island, Illinois. This augurs well for this district. The Pueblo Smelting Works will keep running night and day. Mr. Forman, the superintendent, is winning golden opinions by the way he runs his sampling works. Mr. Roony, his assayer, is also a great favorite. We understand that Mr. Pearson intends to start up the smelter soon on ore from Stein's Pass and San Simon. Some work will have to be done in making a dust chamber before the smelter will blow in. Mr. Pearson informs us that the Bessie mine alone can help the smelter running. The ore is very fine and an easy fluxing ore. There is talk of a very rich find on this side of the Cook's Peak range, right in sight of Deming, about ten miles north of here. The croppings and float are very rich, all covered with green horn silver and native silver. The discovery is kept very quiet, and, with the exception of the parties directly interested, the public cannot find out where the mine is. The ledge is a blind one, and the discovery was accidental. The Victoria mines, namely, Head & Hearst mine, and the St. Louis company, are both pushing matters to their fullest capacity. This mine has been to the Benson smelter what the Kelley mine is to the Socorro smelter, and is one of the best paying mines in the southwest.

OREGON.

NOTES.—Jacksonville *Times*, June 4: Considerable prospecting is going on in different portions of southern Oregon. Jas. Lawrence has returned from a prospecting trip in the Sucker creek district, Josephine county. A boom has started at Galice creek, Josephine county, which promises to extend. Much prospecting is being done, and many claims are being located. The Sterling Mining Co. has quite a force of men engaged in building its huge reservoir, which will be 250 feet wide, half a mile long and 50 feet deep. Notwithstanding the unfavorable mining season a considerable quantity of gold dust has been taken out. C. C. Beekman alone has bought and shipped several thousand dollars' worth. On the 13th ult. the well-known Star gulch mining property will be sold at an administrator's sale. The ditches, water rights, pipe, etc., and everything appertaining to those mines will also be sold. Two tunnels are being run at the Yank ledge, under the management of N. McNair. A considerable amount of all kinds of supplies for the work were lately received direct from San Francisco. A number of men are employed there and a boarding-house has been opened. N. McNair and Henry Hutchins, of Galice creek, were at Grant's Pass last Saturday, and confirm the reports of the rich propects at the Yank ledge. We saw some rich ore from there, which leads us to believe that Galice creek will prove a good mining camp in the near future.

MORE PLACER FINDS.—From a gentleman who came in from Sparta last evening, we glean the news that exceedingly rich placer discoveries have been made the past few days on what is called Saw Mill gulch, about one and a half miles below what was once Gem City, and about three miles from the town of Sparta. In former years claims were worked near the head of this gulch that paid well, but down the gulch, toward its mouth, very little if any attention to its working. Now it appears that two men by the name of Nelson and Beard prospected at this point in the gulch and their endeavors have been crowned with what promises great success. Our reliable informant states that he himself panned out one pan of dirt and got upwards of twenty-five cents. Other parties done equally as well. One party found on the top of the ground a specimen of gold as large as a good sized bean. People from the surrounding neighborhood are greatly excited over the finds and are securing locations as fast as possible. Water for these diggings is to be had from the Eagle Creek canal which can furnish upwards of 1500 inches of water daily. At present the old-time "rockers" are brought into requisition and enables the locators to make good daily wages and not much expense attached.

GOLD.—Bedrock *Democrat*, June 3: Stories of rich gold finds are of nearly every day occurrence of late, and though some of the finds are greatly exagerated as the news passes from the lips of one to another, most of the reports have a great deal of foundation. But the latest reliable report we have now to chronicle, which surpasses the stories often related in early days regarding gold growing on the sage brush. It is the more wonderful from the fact that it is the naked truth, as we have interviewed several parties direct from the camp where the gold was found who vouch for the truth of our statement. A couple of days since, Mr. Thomas Graham, of Granite Creek, 45 miles southwest of this city, while mining his placer claims, picked up a gold boulder, which afterwards being weighed, netted four and one half (4½) pounds—equal to between $800 and $900. Mr. Graham has worked his placers for many years with considerable success, often times picking up nuggets weighing from one dollar to fifty dollars, but had little idea that he would be so fortunate as to make a find as large as this one, though in his dreams he may have had a presentiment of such glowing riches. This large piece of gold will be brought to this city and put on exhibition in a few days. Granite Creek is one of the oldest camps in the State, and one of the richest, every year turning out thousands of dollars to the hardy miner as a recompense for their industry. The gravel beds have deep deposits, and the gulches are wide and lengthy, coarse gold permeating mother earth in all directions. The water supply of the camp is very good and the seasons of working very lengthy. Many valuable quartz discoveries have also been made in this district and the ores assay very rich. Parties who have quartz locations here are this spring pushing the work of development to a considerable extent. In fact Granite district is one of the richest mineral sections of Eastern Oregon.

UTAH.

REVIEW.—Salt Lake *Tribune*, June 5: The receipts of bullion in this city for the past five months of the current year, excluding all ore receipts, and not including some of the producers which make no reports till the close of the year, have been $1,529,556.73. The week that has just passed has fairly inaugurated the hot season. The movements of the metals have been fair, and though the Decoration Day holiday was included in the week, the totals are satisfactory. The receipts of bullion and ore in this city for the week ending June 3d, inclusive, were in aggregate. $92,754.78 of which $79,934.78 was bullion, and $13,720 was ore. The receipts of the week previous were $86,118.95, of which $76,482.88 was bullion, and $9,636.07 was ore. The Ontario shipments for the week last named were 87 bars of bullion, of the value of $49,715.21, bringing the total shipments for the year to date, up to $695,701.29. The Christy sent up from Silver Reef three bars of silver, valued at $5,700, for the week ending the 3d inst. One hundred shares of Stormont stock sold in New York on the 23d May for 12c. The Hanauer smelter produced during the week nine cars of bullion, $19,300. The product for the Germania during the week was two cars of bullion, $5,319.57. Sales of Alice stock in New York are reported. Ore receipts for the week were to the value of $2,600 from the Crescent, and $8,520 from the Honerine, both of Utah.

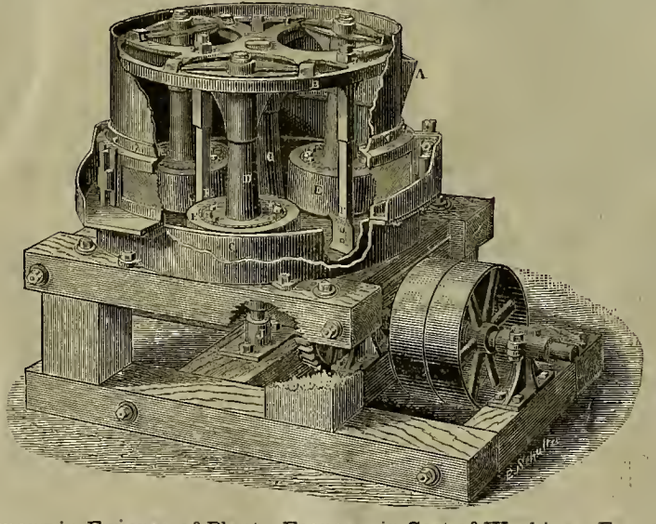
JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
Assayers' Materials,
MINE AND MILL SUPPLIES,
CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.
114-118 Pine Street, · San Francisco

We would call the attention of Assayers, Chemists Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we are confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for Plumbago Crucible Co., London, England.
JOHN TAYLOR & CO.

F. A. HUNTINGTON'S
CENTRIFUGAL ROLLER QUARTZ MILL.



Economy in Expense of Plant. Economy in Cost of Working. Economy in Saving Gold. Economy in Transportation of Machinery. Economy in Cost of Erection of Mill at Mine. Economy in Time Required to Establish Plant (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of continuous use at a number of mines in California has enabled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached THE ABSOLUTE in the construction of a perfect Quartz Mill.

Manufacture of Special Tools.

There is in this city a machine shop, conducted by F. A. Robbins, which is mainly devoted to the manufactnre of such special tools as are used in canning, soap-making, and hydraulic pipe manufacture. The canning interest on this coast is now very large and is extending. Immense quantities of fruit, salmon, honey, etc., are put up every year, and for making the various tin packages to contain these products special tools are necessary. The tools mainly needed are those for stamping up the metal, presses, dies, soldering machines, etc. The canneries purchase their own tin and make their own cans, and it is for this purpose these tools are necessary.

Mr. Robbins has almost the exclusive trade of the Pacific Coast in this line for fruit and salmon canneries. The tools are made for this State, Oregon, Washington, Mexico, and even the high protective tariff of British Columbia does not prevent that market being supplied from this city. A great deal of trade is also done with Australia, Mr. Rohbins having fitted out several canneries there engaged in meat and fruit packing.

A specialty is also made of soap-making machinery, which consists mainly of presses, molds for casting soap, dies for marking, etc.

Special machinery is made for the manufacture of hydraulic pipe, such as punches, shearing tools, etc. A great deal of this wrought iron pipe is made on this coast, and Mr. Rohbins furnishes the necessary tools.

This is a different line of business from the general machine shops. In fact, the proprietor had so much difficulty in getting ordinary machinists to do the work, that he had to break in apprentices who have grown right up with the business. Mr. Robbins started his shop in 1876. He had to have special tools to make this machinery, and as some difficulty was experienced in getting them to suit, he had to make most of them in his own shop.

In addition to the specialties mentioned, Mr. Robbins does considerahle work in the line of shafting, pulleys and hangers, in fitting out such places as need these articles.

The shop is just now engaged in fitting out a new factory at Ventura for making five-gallon oil cans. Altbough called five-gallon oil cans, they are really intended to contain honey. He had previously made a set of tools for this purpose for a Los Angeles factory.

A short time since Mr. Rohbins moved into his present convenient quarters in the new huilding, Nos. 221 and 223 First street. As regards cleanliness, light and convenience this is one of the "pattern shops "of this city. Every thing is handily arranged, and the whole shop is remarkahly clean and neat, looking entirely different in this respect from most machine shops. Numerous windows give an ahundance of light.

Mining Share Market.

Mining stocks have been rather active this week, nearly all the leading Comstocks coming in for their share of patronage. The prospects in the middle mines are improved.

The recent flood of hot water consequent upon the breakage of the big hydraulic pump at the Combination shaft, was exceedingly detrimental to the submerged lower levels, causing swelling of the ground, breakage of timbers, runnings and cavings of the ground, etc., necessitating the expenditure of considerable time and expense in repairs, but this being completed, the work of development was resumed, and is advancing from its last status before the flood. A winze has been started from the 3,000 level of Hale and Norcross, at the most eligible point in the ore vein, to follow it below that level. This is the most important and significant movement which has been made for some time, and in fact it may be considered the most important yet made in the central portion of the Comstock, as tending to the development of the famous old lode below 3,000 feet in depth, at that point, which is the very heart, the tap root, so to speak, of the Comstock.

Development work is advancing well and favorably in Chollar, also, on the 3,000 level, and the continued effective working of the big hydraulic pumping arrangements gives full confidence that no further trouble will be experienced from that quarter.

The low grade ore resources of the old bonanza sections of the north and south ends of the lode, in Consolidated California-Virginia and Crown Point and Yellow Jacket, are being worked for all they are worth, and steadily continue their regular output of ore.

MINING SHAREHOLDERS' DIRECTORY.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are reqnested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its valumore widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.[

FOR WEEK ENDING JUNE 2, 1885.

319,064.—HEAT REGULATOR — Byce & Dias, Petaluma, Cal.

319,066.—ELEVATOR SUPPORT FOR DERRICK WAGONS—Jas. Carlton, Willows, Cal.

319,067.—RAILWAY SWITCH—Geo. Chalmers, San Juan, Cal.

319,075.—HEADER—C. H. Deane, Hopeton, Cal.

319,077.—MANUFACTURE OF BEET SUGAR— E. F. Dyer, Alvarado, Cal.

319,083.—FOLDING BED—Benj. F. Farrar, S. F.

319,235.—STEAM GENERATOR—W. A. Grondahl, Portland, Or.

319,117.—HEADER STEERER—W. H. Parks, Jr., Marysville, Cal.

319,125.—WORKING ASPHALTUM—Rice, Steiger & Thurber, San Jose, Cal.

319,121.—HARROW—W. F. M. Ricketts, Colton, W. T.

319,132.—LIFTING APPARATUS—C. Sanborn, Sacramento, Cal.

319,136.—GRAINING SKINS—E. Schroeder, S. F.

319,350.—HOSE COUPLING—J. T. Titus, S. F.

319,220.—MAIL BAG—J. C. Franklin, Pendleton, Or.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possibls (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtainod, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHANK-STIFFENER FOR BOOTS AND SHOES.—Adam Hummer, S. F., assignee of one-half to M. Youngpeter. No. 318,562, datcd May 26, 1885. It consists of a steel plate having its front end made broad and thin, the sides curved and narrowed into a shank or body, which is correspondingly thickened in its central portion, this shank heing again expanded and having a thin circular plate within the heel of the shoe, the form of the whole shank heing such that it conforms to the line of nails and stitches which pass through the leather just outside of the edges of the shank.

TRACE BUCKLE.—Ogden Mallory, Auhurn, Placer county. No: 318,572. Dated May 26, 1885. The invention consists broadly in the combination, in a single buckle, of devices for engaging and holding the trace, and for engaging directly and holding a strap at right angles to the trace, and which forms a continuous saddle and helly strap for one side of the harness or the hillet of either the saddle or helly strap for the other side of the harness. The patent also covers the arrangement and combination of certain plates and links hy which these results are accomplished, and also hy which the buckle may he made to answer, when desirahle, the single purpose of connecting the trace to the hame-tug.

MECHANICAL TRAVERSE-TABLE. — Wm. D. Patterson, Savonas Ferry, British Columhia. No. 318,578. Dated May 26, 1885. This is an implement for simplifying the checking of traverse surveys and facilitating the tsking out of latitudes and departures corresponding to certain distances and vice-versa. This instrument the inventor calls a "mechanical traversetahle" from the nature of its operation and the result it effects. It consists in an arc subtending an angle of 90 degrees and properly graduated or laid off in degrees and fractions thereof; a pivoted swinging arm forming the radius of said arc and properly laid off in chains and fractions; a line forming the side radius of the arm and laid off in chains and fractions showing the latitude, and in a slide moving over the radial arm truly at right-angles with the side radius of the arc, and laid off in chains and fractions showing the longitude. The general construction of these parts and their mechanical arrangement, including the means for setting the radial arm, the means for guiding the slide, the movable or adjustahle reading-glass thereon and the exterior frame of the instrument are also features of the invention.

Bullion Shipments.

Hanauer, June 2, $2,200; Silver Reef (for May), $44.426; Ontario, June 2 $22,989; Christy, June 2, $1,460; Hanauer, June 3, $8,500; Queen of the Hills, June 3, $1,200; Hanauer, June 4, $2,000; Christy, June 4, $1,840; Honerine, June 4, $8,520; Hanauer, June 5, $1,950; Stormont, June 5, $3,850; Hanauer, June 6, $3,850; Crescent, June 6, $3,100; Queen of the Hills, June 6, $1,700; Christy, June 7, $4,859; Kentuck, June 7, $5,000; Hanauer, June 7, $1,900; Stormont, June 7, $1,650; Queen of the Hills, June 7, $1,300.

The banks of Salt Lake City report the receipt for the week ending June 3d, inclusive, of $79,034.78 in bullion, and $13,720 in ore; a total of $92,754.78.

SIGNS are apparent that some of the better prospects in the Columbus Mining District, Nev., will he worked more generonsly this summer than for many years past.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 166 12mo. pages, with illustrations, well bound in cloth; 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II and III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthat; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, $1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

These are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

NOTICE TO ARCHITECTS.

$250 for Plans.

THE DIRECTORS OF THE INSANE ASYLUM OF Arizona propose to erect an asylum of sufficient size and capacity to accommodate 100 patients, near the City of Phœnix, in Maricopa county, Arizona Territory, and for the purpose of obtaining plans and specifications suitable for such an institution, hereby make the following offer to Architects, namely:

FIRST. The Directors will receive plans and specifications offered by Architects, and place on file with their Secretary, N. A. Morford, at Phœnix, Arizona, on or before the 3d day of July, 1885.

SECOND. On said day, or as soon thereafter as practicable, the Directors will examine all the plans and specifications offered, and if any one of them shall be approved by the Directors and adopted for the construction of said asylum, they will pay to the party offering the same, two hundred and fifty dollars; but the Directors reserve the right to reject all plans and specifications offered.

THIRD. The material to be used in the construction of the buildings will be brick, iron, and wood, unless some different material shall be found which is more desirable and which can be supplied for an equal cost.

FOURTH. The cost of the whole construction must not exceed $45,000.

FIFTH. The buildings must be complete in themselves, but so arranged that their capacity may be largely increased with facility by additions without changing or removing the structure.

SIXTH. The prices of material and labor at the site of the building will be approximately as follows, viz.:

Lumber per M., finishing and flooring	$65 00
Lumber per M., rough	45 00
Brick laid in wall, per M	14 00
Rockwork for basement, per perch	3 50
Iron, per lb	4c
Lime, per 1,000 lbs	2 00
Wages. Carpenters, per day	4 00
Bricklayers, per day	5 00
Laborers, per pay	2 00
Painter, per day	4 00
Plasterer, per day	5 00

SEVENTH. The climate is temperate, but the mercury ranges high during about three months of the year, and then it drops to the freezing point in winter, occasionally, and hence provisions must be made against extremely warm as well as cold weather. The temperature ranges approximately as follows:

	Maximum, Means for 1884.	Minimum, Means for 1884.
January	70.1	31.1
February	70.5	34.5
March	76.1	32.9
April	85.2	40.8
May	93.4	49.1
June	103.4	55.7
July	102.0	63.3
August	104.2	63.2
September	89.9	48.3
October	93.0	51.3
November	83.2	40.1
December	67.8	36.1

All plans and specifications sent by mail or express must be prepaid and marked "Plans and Specifications for an Insane Asylum," and addressed to the Secretary of the Directors of the Insane Asylum, Phœnix, Maricopa County, Arizona.

Plans and Specifications will be returned, if required, on receipt of cost of transportation. N. A. MORFORD, Sec'y Board of Insane Asylum Directors.

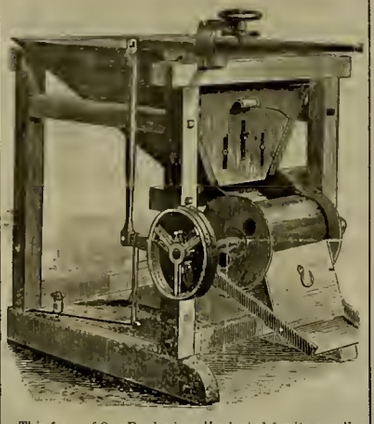
THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)



This form of Ore Feeder is well adapted for its peculiar work.

Manufacturers of the Celebrated "Challenge" Ore Feeders for wet and sticky ores; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ores.

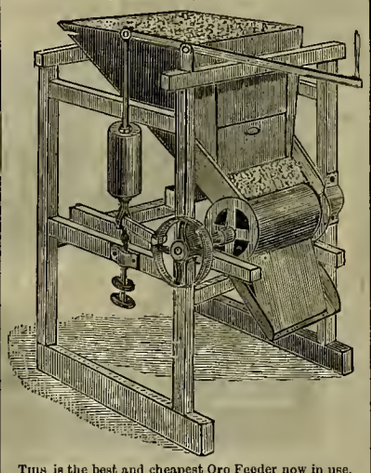
Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

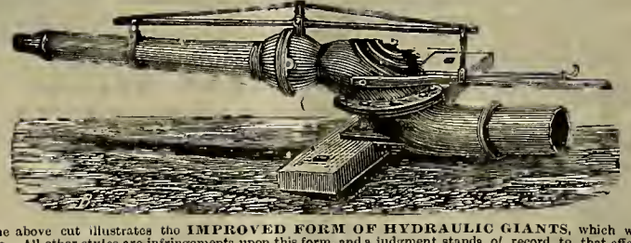
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers,

237 First Street, SAN FRANCISCO, CAL.

IMPROVED FORM OF HYDRAULIC GIANTS.

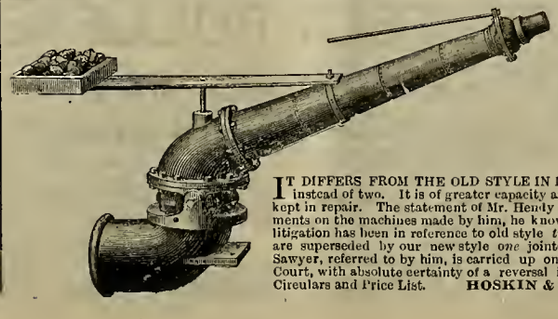


The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All other styles are infringements upon this form, and a judgment standa of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

PRICES furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.



THIS CUT REPRESENTS OUR

IMPROVED

HYDRAULIC

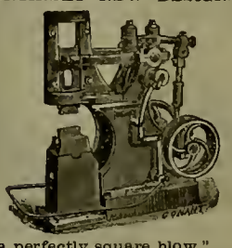
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List. HOSKIN & CO., Marysville, Cal.

BEAUDRY'S

Upright Power Hammer.

ENTIRELY NEW DESIGN.



SIMPLE, PRACTICAL, LOW-PRICED.

SIMPLE, PRACTICAL, LOW-PRICED.

"Gives a perfectly square blow."

"Does not vibrate."

"Requires no helper."

"Repairs are little or nothing, and there are no springs to crystalize."

"Can he run cheaply and with very little power."

"The anvil is entirely separate from the frame."

"Always ready for use."

"Open space between the dies."

"Will give one blow or more as required, light or heavy."

"Does not chill the work."

"The Stroke can be changed easily and quickly."

"It is the least complicated and most efficient power hammer in the world."

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

PRICES GREATLY REDUCED.

IRON CLAD MANUFACTURING CO.,
22 Cliff Street, New York.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim ths following advaotages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired hy any mechanic in a few uinutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except hy regrinding, which is expensive if done by hand, and if don. by machine soon wears out the valve, and in most cases thsy have to bedis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patsnt, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

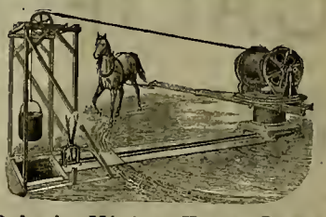
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Working in Hot Mines.

When men first begin to work in very hot mines they lose their strength almost invariably and the slightest exertion is burdensome. They feel no desire to eat and the stomach commonly rejects what food is taken. Ordinarily, also, the decrease in their weight is very considerable. This condition of body does not last more than three or four days usually. Then the men regain their vigor and flesh rapidly, their appetite returns and their health does not visibly suffer. In many instances the effect of heat is clearly beneficial. By the exercise of care in avoiding sudden chills rheumatic affections are eradicated; all impurities of the blood are rapidly purged from the system, boils, pimples and other eruptions soon disappear, the flesh becomes plump and firm, the glands secrete oil rapidly, the skin grows smooth and slippery to the touch and the complexion is clear if somewhat sallow. This is the record of the U. T. census agents, who investigated this subject in 1880 on the Comstock, where there is an abundant field for examination and comparison.

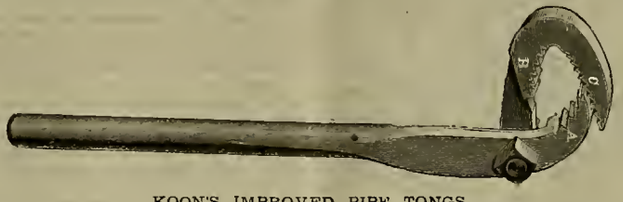
The ultimate effect of this extreme heat on the miner's constitution is not so easily noted. The mine levels on the Comstock differ so materially in temperature and the assigned station of a miner is so frequently changed that it is impossible to obtain complete and comparative data. That prolonged labor in a hot, impure atmosphere will assuredly shorten life appears indisputable, but whether the system is permanently or materially injured by intermittent work under these conditions is more questionable. The power of recuperation appears extraordinary, and unless the strain is intense and frequent no lasting injury may be inflicted. The limits of permissible strains will, of course, vary with the relative power of endurance.

In the recent monograph of the U. S. Geological Survey, by Eliot Lord, on "Comstock Mining and Miners" it is stated on the authority of the testimony procured by the census agents that the action of all the bodily organs of the Comstock miners appears to be stimulated by the heat with the exception of the stomach alone. The food of the ordinary laborer is unpalatable to the miner in the hot levels, and coarse ill-cooked provisions would not be accepted or digested readily. The men crave fruits and highly seasoned dishes, pickles, pigs' feet, hams, almost every food with a pure acid or salt flavor. They demand and obtain the best supplies possible to gratify the natural craving and squeamishness of taste. The delicate condition of their digestive powers is as undoubtedly due to the quantity of ice water which they drink, as to the heat which they undergo. Yet they must have cool drinks at frequent intervals, and feverish men cannot be expected to gauge carefully the quantity or the coldness of the water which they need. If the temperature of the water-tanks was regulated by the mine superintendents their employes would be less subject to dyspepsia.

TUOLUMNE county has 2,006 school children.

Koons' Pipe Tongs.

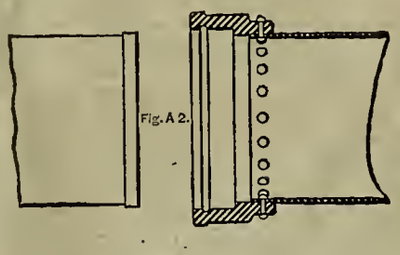
George B. Koons, of Half Moon Bay, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved form of pipe tongs, which is shown in the accompanying engraving. The lever bar has the outer end slightly curved beyond the fulcrum pin, which passes through it, and a hook-shaped jaw hinged to the fulcrum pin so that its end will pass by and overlap the curved end or jaw of the lever to which it is hinged, the interior of both the shaft and the movable jaw being corrugated so as to hold the pipe.



KOON'S IMPROVED PIPE TONGS.

The handle or lever, made of suitable length, has its upper end curved to one side, as shown at *A*. The hook-shaped jaw *B C* is pivoted to the flattened portion of the handle, *A*, by a bolt. The portion *A* forming the jaw upon the main lever is made of such thickness that it extends outward so as to stand opposite the jaw *B* upon the side where it is bolted to the lever, and the opposite hinged jaw in a like manner extends over the side of the flattened portion of the main arm so as to give considerable thickness and bring the two jaws opposite to each other.

The jaw *B C* is made of such a length and bent to such an angle that its outer end will just pass the point of the jaw *A*, where the two are closed together, and by this construction the two jaws will take in pipes having a considerable difference in size. The interior of both jaws is corrugated so as to take hold of the pipe, and it will be seen from the peculiar shape of the jaw *B C*, and the curve of the jaw *A* that the pressure will be applied to three sides of the pipe or bolt on which the device is to act. This enables the inventor to apply a very strong power without crushing the pipe.



Bell End Joint.

Fig. 2.—Moore & Smith's Pipe Joint.

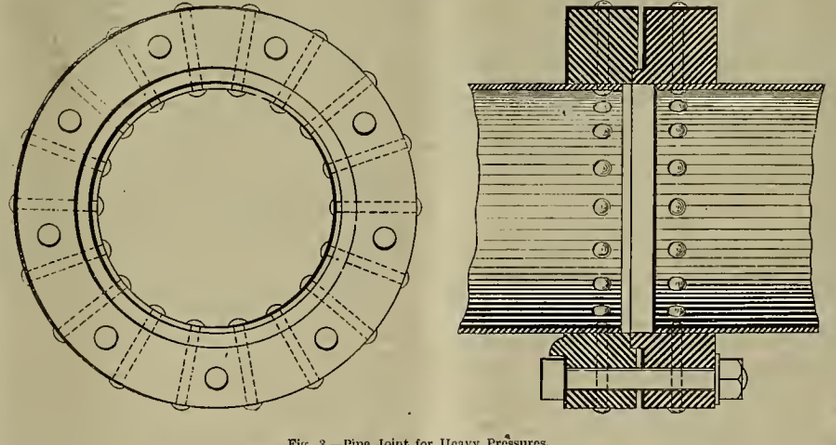


Fig. 3.—Pipe Joint for Heavy Pressures.

PIPE JOINTS FOR HYDRAULIC PIPE AND PUMP COLUMNS.

WOOD RIVER has four towns within a radius of 12 miles, namely: Bellevue, Hailey, Ketchum and Bullion. Bellevue has 1,000 inhabitants, Hailey 1,200, Ketchum 1,000, and Bullion 400. It is quite dull at these camps at present; mines full handed.

Quite a lively mining camp has sprung up at Deadwood near the boundary line of Shasta and Trinity counties.

MR. HENRY G. HANKS, State Mineralogist, has returned to San Francisco from New Orleans.

Pipe Joints.

The wrought-iron riveted pipe made in large quantities in this city for mining purposes is mostly made with inside and outside parallel courses, with an inside sleeve riveted on one end. This sleeve projects into the adjoining section of pipe where the pipes are laid together. A band of iron is put over this joint, having an annular space between it and the pipe, which is filled with lead and caulked. This is Moore & Smith's joint, which is illustrated in Fig. 2 on this page. It was patented by Joseph Moore, superintendent of the Risdon Iron Works, and Francis Smith. The meeting ends of the pipes are connected firmly together and the band or tube is placed around the outside of the meeting ends, which is larger in diameter than the pipes, and which is large enough to extend a distance on each side of the joint. The space between the outside band is then packed with lead, either by casting or tamping.

This is found to be the best sort of joint for thick pipes that are too small for riveting together, and even where the pipes can be riveted together an occasional joint of this kind is good, because it allows for expansion and contraction, and by its use pipes may be run out of a straight line without the use of elbows. For pipes made of No. 18 and 16 iron the joints can be made by slipping one into the other. Such joints are termed "slip joints." The pipe joint for heavy pressures, such as are used for hydraulic pump columns in mines, is shown in Fig. 3. The Risdon Iron Works of this city have made several thousand joints of this style, in the construction of pipe of wrought-iron and cast-iron for hydraulic machinery. For water pipe for hydraulic mining and water works the Risdon has built over 150 miles—some of it of the largest size—up to 52 inches in diameter. The pipe for the Spring Valley Water Works recently made, requires 16,000 tons of plate iron and rivets in its manufacture.

AMADOR MINES.—We were shown this week some very rich nuggets from the Gover mine, Amador county. They were black, antimonial sulphurets covered with gold. About six pounds of this black stuff taken out of a little pocket paid $124 per pound. It is similar to the material which comes from the well-known Nevill mine, on the Mokelumne river. The Gover mine has been shut down the past few years, but has been started up again, pumped out and 20 stamps are running on its ore now. They have a good ledge and good prospects. On the 500 level there are 15 or 20 feeders, and above they are working 12 feet of a ledge. Our informant thinks that during the next few years many more mines will be worked in Amador county than at present.

THE CHEAPEST MACHINERY to buy is the *best*. It will wear longer, require less repairs, and give better satisfaction than though cheaper in price because inferior in workmanship.

GOLD dust has been found near Pioche, Nev., in the sediment, from washed wool fleeces. Everybody is seeking for the spot where the sheep had been rolling.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Gravel Deposits of the Lower Klamath.

EDITORS PRESS:—There is a vast and diversified system of gravel deposits in Humboldt and Del Norte counties, on and contiguous to the coast, which is unlike the placers of any other portion of the State, and are worthy a careful study by both the gold miner and the geologist. The Klamath river, as it at present runs, has a course for the most part at variance with the general course of large streams on this coast, and there are evidences that this identical river, as also the Trinity river, and not a former system of rivers, found their way to the ocean by a different course than that through which their waters now flow. In order to comprehend fully the extent and richness of the gravel and quartz debris that have been deposited on their way to the sea level, it will be necessary to first refer to the fact that there is lying southeasterly and northwesterly, from 40 to 80 miles from the beach, a strip of country threaded with free gold quartz, a heavy ledge of which was tapped in the celebrated Black Bear mine, on the Salmon river. The tributaries of the Klamath, nearly all, cut their way through this quartz section, which shows itself rich at intervals until it crosses the Trinity river, and in its southeasterly course crosses the coast divide and spends its wealth on the headwaters of tributaries to the Sacramento river. The Trinity river and tributaries, in particular, are the recipients in a rich degree of this gold-bearing debris, and there is scarcely a tributary of either the Klamath or Trinity but what has gold-bearing gravel and has been mined with greater or less degree of success since the first gold mining excitement. Thus it will be seen at a glance that these two rivers, the Klamath and Trinity, both during their former and present channels, have necessarily become the highway for the decomposed quartz debris that has been loosened from the gold-bearing ledges of a territory hundreds of miles in extent and known to be exceptionally rich in auriferous deposits. A great portion of this territory, and which contains gravel beds which in extent are well-nigh inexhaustible, has only known the rush and haste of the earlier mining methods, and when they ceased to pay with rocker or pick and shovel sluice have been abandoned.

A few large gravel banks indeed were located and organized; capital attempted their development on a large scale with advanced mining appliances and methods, but the operations were placed in charge of kid glove superintendents, whose inevitable failure brought disrepute, which combined with other causes, turned the attention of mining men and capital to other sections. The facts remain, however, of extensive and rich placers; of magnificent water privileges; of abundance of fine timber; of uniform climate and a country that will produce an abundance of food; last and most important of all, the Klamath is free from the debris trouble, for it finds its channel through a canyon and debouches suddenly upon the ocean from between high mountains. There can be no fear of injunction from valley farmers and the water is ample to carry on the largest character of placer mining.

These remarks apply to and are descriptive of that section of the Klamath river from the intersection of the Trinity to the ocean. The river is a fine navigable stream, and one cause for the tardy development of its mineral wealth lies in the fact that while the river is the natural avenue through which development and progress must come, it has been locked up by a sham Indian reservation. This reservation will be thrown open next spring, when it is most likely the placers of which I have spoken will receive the attention they deserve.

As an *on dit* I may mention the fact that Mr. A. Jacobs, of Plumas, and Dr. J. W. Starr, of Oregon, have recently located what I conceive to be a most valuable gravel claim and water privilege, and design to bring in a ditch this summer sufficient to fill two giants. The gentlemen are both experienced placer miners and have during the last two months made a very thorough prospect of their claim, which they say is rich as they want it for hydraulic mining.

WM. AYERS.

ARASTRAS.—Some of our gold ledge owners are thinking of putting up the old fashioned arastra on their claims, in order to work and develop the same, and when time and labor proves satisfactorily that they have something of value to work on, they will then see about putting up a mill. This is the right way to prospect and open out your property. If it proves good, then it will be soon enough to determine the nature and quality of works you require. If every claim owner would only go to work and stick to it until good or bad results were obtained, instead of going around with samples and blowing about them in hopes of trapping a purchaser, this Territory would improve rapidly and prosperity replace poverty. —*Prescott Courier.*

About $500,000 in gold dust and gold bars were shipped from Shasta county in 1884.

Progress of Metallurgy.

Smelting Copper, Silver, Lead and Zinc.

In an article on the "Inventories Exhibition" in the London *Mining Journal*, after referring to the progress in iron and steel making, the writer says:

In the smelting of copper ores the most striking feature is the development of the method originally proposed by Henderson of extracting small quantities of copper from burnt pyrites by calcination with salt and lixiviating with water, which leaves the iron of the pyrites, formerly wasted as slag, in a form that can be economized by the iron smelter. This has been improved by Claudet's process of separating as iodide the silver which is almost entirely contained in the first part of the copper liquors and was formerly lost. Another and less convenient method of separating such silver as sulphide has been proposed by Gibb. In the older smelting processes gravitating calcining furnaces, such as those of Gerstenhofer, Hasenclever, and Helbig, have been introduced to do away with hand labor in roasting pyritic ores; these are mostly combined with methods for utilizing the sulphur gases in sulphuric acid making. In fusion processes tall blast furnaces and cupolas have to some extent superseded the Welsh reverberatory form. In America, especially, cupolas with water-jacketed hearths are in great favor. Attempts have been made to simplify the Welsh process of smelting by substituting the Bessemer converter for the more gradual methods of concentration in the reverberatory furnace. This, as originally tried with pyritic ores by Hollway, failed, but has since achieved some success as a substitute for the roaster process in producing blister copper from regulus by Manhes, of Lyons. In the refining of copper the principal improvement has been the adoption of Percy's method of producing sound castings by the use of phosphorous in small quantities, which has also been extended to the alloys known as phosphor bronzes. Valuable copper alloy has been formed by the addition of small quantities of other metals, such as manganese, in Parson's manganese bronze, now generally used for large screw propeller and iron in the so-called sterro metal and delta metal. A small proportion of silicon is also used for imparting strength to copper in the alloy called silicon bronze, which possesses great strength, while its electric conductivity is but little less than that of pure copper. A new departure in copper refining has been made, consequent upon the introduction of dynamo-electric machines—the refining of blister copper or rich foreign regulus electrolytically, the metal being obtained in a very pure state, while foreign matter, including gold and silver, remain behind in a form convenient for further treatment. This has as yet been only adopted in a small number of instances.

In Lead Smelting

The processes based upon the operations of complete desulphurization and fritting or actual fusion to slag in the roasting furnace, followed by reduction in large blast furnaces, mainly with water casings, are now very general, and in America the automatic or siphon tap, which allows the operation of casting the reduced lead into pigs to go on continuously, is frequently added to such furnaces. Parke's method of desilverizing lead by means of zinc, which had remained in abeyance for many years, has now come very generally into use, having almost entirely superseded Pattenson's process of crystallization. This is in some way due to the improvements made in the accessory operations of refining the desilverized lead and the recovery of the silver from the zinc crusts, upon which much ingenuity has been expended. Among the former contrivances may be mentioned Cordurie's method of removing zinc by steam at a red heat, and that of dissolving the zinc oxide by carbonate of ammonia. For the distillation of the argentiferous zinc Faber du Faur's bottle-shaped retort and portable furnace is most used. The most important modification of Pattenson's process is that of Luce and Rozanne, who effect the crystallization by blowing steam through the melted lead and tap off the enriched liquid lead from the crystals, an arrangement that enables steam-power to be substituted for hand labor. The separation of lead from silver has also been effected electrolytically by Keith, in America, but as yet only on a small scale.

In the Production of Zinc

Numerous improvements in detail have been made in the old processes, with a view of economizing fuel and more perfectly condensing the reduced metal. The growing scarcity of calamies or oxidized ore has led to the substitution of blende, which necessitates very careful calcination, as well as methods of absorbing the sulphurous gases, such as ordinary acid chambers and towers containing lime water, sulphide of calcium or dolomite. In the reduction of the oxide, gas furnaces such as those of Siemens and Boetius are in favor, and the number of retorts or muffles per furnace is largely increased, as many as 64 muffles and 40S retorts being now heated from a single fireplace. The condensation of the zinc vapor has been improved by increasing the size of the receivers, and filtering the exhaust gases of the retorts through cotton wool, the substitution of aspirators drawing the gases through water for the natural draught, and similar contrivances. The production of zinc as a continuous operation without the use of retorts has been tried by numerous inventors, but as yet without success. The utilization of the intimate mixtures of lead, zinc and copper ores known as bluestone, which cannot be separated mechanically, has been effected on a working scale by a combination of furnace and liquid extraction processes by Maxwell, Lyte and Parnell. Among the less abundant metals nickel has come into increased use, as means have been found of depositing it by electrolysis upon brass and other metal work as a hard and very brilliant covering. Sound castings from pure nickel have also been obtained by Fleitmann, by the addition of a small quantity of magnesium to the melted metal.

The Metallurgy of Silver

Presents little that is new in principle, although many of the older processes have received important modifications in detail. The European process of barrel amalgamation is now almost abandoned, the American pan process being perhaps most generally used, although the primitive method of amalgamation in open heaps, with the assistance of only solar heat is still predominant in Mexico and other Spanish-American countries. On the southwest coast of America Krohnke's process of amalgamation in barrels with subchloride of copper and zinc, amalgam has been largely used. Where it is necessary to subject ores to a chloridizing, roasting, mechanical, or gravitating furnace, such as Bruckner's rotator and Stetefeld's tower furnace are preferred. Percy and Von Patera's method of extracting silver by alkaline hyposulphites has been introduced in America, though not to the same extent as amalgamation. A new modification has recently been proposed by Russel, in which the silver solvent is a double hydrosulphite of copper and sodium.

In the metallurgy of gold the chief novelties are the general introduction of cast-iron vessels and sulphuric acid as a parting agent in separating gold from silver, and a process founded on the old method of parting by sulphur combined with oxidation by air and the adoption of means of saving the sulphur gases by Rossler. Auriferous copper is also economically treated by subjecting the granulated metal to the slow action of sulphuric acid and moist air, whereby no acid is wasted. The separation of silver in small quantities from gold has been effected by Miller by blowing gaseous chlorine through the melted alloy, and the same process is also used for toughening gold intended for coinage. The refining and manufacture of the heavy metals of the platinum group, and more particularly platinum and nidium, have received a great impetus from the introduction of Deville's method of fusion in lime furnaces; but the further consideration of the subject belongs rather to general chemistry.

The utilization of slags from different kinds of smelting processes has not as yet made much progress. The highly phosphuretted slags of the Thomas and Gilchrist process are subjected to chemical treatment to recover the phosphoric acid for use as a manure, while those of the blast furnace when granulated are used in making Portland cement concrete, and to some extent as an improver of the cement. Another product known as "slag wool" or "silicate cotton," made by blowing air through liquid slag, is used as a non-conducting covering for steam pipes. In America the practice of allowing the liquid slag to run to waste over the ground instead of moulding it into blocks is now very common, and is followed even when it is necessary to remove it for some distance from the furnaces before pouring it out. This is done by using large tanks lined with fire brick, which are drawn away by locomotives when filled.

THE PROSPECTOR.—A correspondent of the Pioche *Record* says: It is, I believe, the general supposition that the life of a prospector is a lazy and a lonely one, spiced occasionally with some harmless delusion, such as building castles in the air, during which he imagines himself a millionaire, with thousands at his command, wherewith to build mills, roads, etc. As to the vocation being a lazy one, I differ with the general public, that is, the larger class of citizens who are willing enough to concede to the prospector the merit of being the pioneer of civilization in the far West, but who still retain a lurking suspicion that he is somewhat a lazy, devil-may-care kind of fellow, that is satisfied with a hermitage in the mountains as long as he has enough bread, bacon and coffee to satisfy the inner man. Now, nothing is farther from the truth than this, for the man who devotes the best years of his life in searching for the precious metals is too ambitious to be lazy; besides, his mistress, the golden-visioned goddess of the Sierras, rules him with a hard hand, if it is a golden one. As to prospecting being a lonely business, it is quite the reverse, for the fortune seeker learns to love the aroma of the pine and cedar, and while he views the large expanse of country from some lofty peak near his mountain home, he feels as free from the burdensome conventionalities of this Nineteenth Century as old Father Adam was when he first saw the light of day in the Garden of Eden. Besides, there are reminiscences to be related by the camp-fire, for there are few prospectors but who have led eventful lives in their search after the precious metals in Arizona and the other outlying Territories, where the scalp and knife of the Indian hung over their trail like the sword of Damocles over the Philistines.

The old Merrimac mill on the Carson river, one of the oldest style quartz mills in Nevada, will soon be dismantled or modernized.

The Mechanics' Fair.

Preliminary Announcement of the Twentieth Exhibition.

A preliminary announcement concerning the Twentieth Industrial Exhibition of the Mechanics' Institute at the Pavilion is made by the Board of Trustees for 1885, as follows:

The Mechanics' Institute of the city of San Francisco, organized in 1855 for the dissemination of information and useful knowledge, which has held under its auspices nineteen industrial fairs, again takes pleasure in announcing that the twentieth exhibition of art, manufactures, science and natural products, will be opened on Tuesday, August 25th, at their immense Pavilion, located on Larkin, Grove, Polk and Hayes streets, which will be still further enlarged and improved for this occasion, and supplied with every requirement for the proper display of articles and machinery, including a plentiful supply of steam, water, gas and power, the latter from a large and powerful engine to be manufactured expressly for this exhibition.

It is conceded that a comprehensive exhibition of natural or manufactured products, when given by a Government, State, county or society, is productive of good to the general community by bringing together at one time the producer and consumer, the manufacturer and dealer, or those engaged in like occupations, whereby an exchange of ideas may be had and comparison of results arrived at, which have been carried out in various ways for the same end, but under different rules and conditions.

The benefit of these gatherings of people and products has been recognized by all great nations, particularly our own Government, for twice our Representatives at Washington have made an appropriation for such purposes, namely, at Philadelphia and New Orleans. Material aid has also been given by nearly all the States in the Union to encourage and foster local fairs within their borders, showing that our wisest legislators believe in such exhibitions, and recognize their benefit to the commonwealth.

It is the desire of the management to have the display of manufactured and natural products as full and perfect as possible, that the varied resources of this coast may be brought together in such forms as may best afford the citizen seeking information, the capitalist seeking investment, the visitor from the Eastern States or immigrant from Europe seeking a business opening or a home, an opportunity to inform themselves of the skill and advancement of our citizens and inventors, and the variety, excellence and superiority of our products, which in the near future must and will be an important factor in the world's consumption.

To that end the managers hope to have a general display of manufacturing machinery in operation, raw and manufactured products, and all articles used in the arts and sciences, and necessary for the wants of man.

Firms and individuals who wish to have their articles brought into extensive notice for general good or individual benefit, can find no better place or opportunity than this occasion offers.

Liberal and comprehensive premiums will be awarded to exhibitors, consisting of gold, silver and bronze medals, diplomas and cash.

At the close of the fair a full and complete report will be published for general distribution, with notice of each exhibitor and article exhibited.

A copy of the rules and regulations, premium list, or any desired information will be promptly given or sent, on application to the Assistant Secretary.

The Trustees for 1885 are as follows: P. B. Cornwall, president; David Kerr, vice-president; J. A. Bauer, treasurer; W. P. Stout, secretary; J. H. Culver, assistant secretary; J. H. Gilmore, superintendent; C. Watherhouse, D. J. MacDonald, C. F. Bassett, Geo. H. Hopps, S. J. Hendy, James Spiers, George Spaulding, J. R. Wilcox, Byron Jackson, John Mallon.

The office of the exhibition is at 31 Post street, San Francisco, Cal.

A NEW CONCENTRATOR.—The Denver *Times* says that Gov. Tabor has organized a company to manufacture and introduce a new concentrator which, if it shall do what is claimed for it, will cause a revolution in mining in Colorado and the West. After the crushing of the ore it is concentrated by means of pans, arranged to work much like prospectors' gold-pans. Each machine has about a hundred pans on it, or has a capacity of seventy-five tons a day. From 75 to 85 per cent of mineral is claimed to be saved, and the cost of treating the ore is only forty cents a ton. The cost of each machine is about $2,500.

FIVE STAMP MILL.—E. A. Reid went below yesterday morning to purchase the five-stamp mill and concentrator they are preparing to erect on their mine at the head of Star Gulch. Ed. will visit the foundry at Marysville, also those in San Francisco, and will purchase where he can get the best bargain. The foundation, houses, etc., are now prepared for the mill, and inside of two months the music of a five-stamp mill will be heard in the Buckeye district.—*Shasta County Democrat.*

All of the new hoisting and pumping machinery at the Nevada county (Fleming) mine in Deer creek, at its junction with Gold Run, has been started.

MECHANICAL PROGRESS.

The Patience of Metals.

We take the following paragraph from Dr. Percy's address delivered before the Iron and Steel Institute May 6th: We hear in these days of the "fatigue," "refreshment," and "patience" of metals, terms which, when applied to inanimate objects, may bewilder the uninitiated, and at first, perhaps, puzzle the initiated. When a metal is subject to mechanical treatment which produces what is called stress or strain, its component particles may become so disturbed and disarranged, within the limits of elasticity be it understood, that, after its withdrawal from such treatment, and left at rest, some time, and in certain cases considerable time, must elapse before the particles will have spontaneously readjusted themselves as they originally were. The word fatigue, I apprehend, is meant to indicate such disturbance; the word refreshment, restoration of the metal to its original state; and the word patience, the time required for that restoration.

So lately as February last a paper was read to the American Institute of Mining Engineers by Mr. Henry M. Howe, Boston, on the patience of copper and silver as affected by annealing, on which he has experimented. His results possess considerable interest. He refers to the experiments of Prof. R. H. Thurston on the resistance of iron to prolonged stress, which show that an unannealed iron greatly exceeds in tensile strength the same iron when annealed, a fact long previously known, so it likewise greatly exceeds the latter in patience. I must refer you to the original papers for information as to numerical and other details, because time forbids that I should do more than notice the subject on the present occasion. The power, Mr. Howe remarks, of resisting prolonged stress bears no fixed relation to what is commonly called tensile strength, or the power of resisting tensile stress for a very short time. He suggests that the word endurance might be more appropiate than patience for expressing the former kind of power.

A paper on the influence of stress and strain on the physical properties of matter has recently (December, 1884) been communicated to the Royal Society by Mr. Herbert Tomlinson, in which is contained matter of interest and of practical importance in references to the application of iron wire. He finds the loss of energy of a torsionally vibrating iron wire to be permanently diminished to a very large extent hy repeated heating to 100° C., and cooling combined with long rest, and to be very considerably diminished temporarily by rise of temperatures.

There is a widespread impression, not to say belief, that a razor when left at rest some time after use becomes sharper spontaneously. The number of persons having the opportunity of personally experimenting on this important question has greatly decreased in recent years, yet some remain who still practice the tonsorial art and it must be left to them to determine whether that impression be erroneous or not. Should it prove to be correct, then the razor might probably be adduced as affording an illustration of fatigue, refreshment and patience. Is it not strange that on such a simple practical question as this opinion should still be divided?

MELTING STEEL SCRAP IN A CUPOLA.—The Columbus (Geo.) *Enquirer* publishes the following: Columbus has done what no other foundry in the United States has ever done—*i. e.*, accomplished the feat of melting steel scrap in an ordinary cupola. This has been done by Mr. Kohers E. Masters, foreman of the Columbus Iron Foundry. The iron works had tons of steel scrap on hand which they considered dead stock, and Mr. Masters summoned his ingenuity to make it profitable and useful. The steel was of a class of steel known as plow or agricultural steel, and he succeeded in melting some 70,000 pounds of it, and making it into old plow points with complete success. Lately the iron works made another step forward in foundry practice—that of melting and successfully molding rail steel. The iron works were solicited by the general superintendent of the Baltimore & Ohio Railroad to instruct them in the method of steel melting. As there are thousands of tons of steel rails in the country of no value, Mr. Masters got the president of the iron works to let him undertake to melt the rail. He cut the rail into pieces a foot long, and made a trial heat of a 1,000 pounds. He succeeded in producing some very fine castings, at a rate of five pounds of steel to one pound of fuel, consumed at a temperature of about 3,000 degrees.

IMPROVING THE BESSEMER PROCESS.—Mr. Loudsr, of Pittsburg, Pa., has patented what he claims to be an important improvement on the Bessemer process, in which the charge of metal at the end of the blowing operation contains the desired amount of carbon, as distinguished from the ordinary method, whereby the entire charge of pig metal is first completely decarhurized, and the carbon is added after the blow is finished. The inventor first charges the converter with a portion only of the entire charge, and after treating it in the usual way until it is thoroughly decarhurized the remainder of the charge is added. The air blast is turned on until the silicon is removed, and the blow is stopped at the point where the further decarburization would commence, after which the requisite amount of manganese is added. One of the advantages claimed for this process is that, as no decarburizing addition is inserted into the charge after the final blow, the whole process may be conducted with a single kind and quality of pig iron.

A New Process for Hardening Plaster of Paris.

A new process for rendering plaster very hard and capable of being substituted for wood in flooring has been brought out by M. Juhls. Plaster has this advantage over cements, and even over wood, that it increases rather than diminishes in bulk on being applied to structures, but it fails in hardness and surface resistance. To overcome this difficulty M. Juhls mixes six parts of good plaster with one part of rich lime recently slaked and finely sifted. This mixture is to be used like ordinary plaster, and the object made from it when it is very dry is caused to imbibe a solution of a sulphate, which has a base precipitable by lime, and this precipitate is insoluble. Such are the sulphates of zinc or iron. The theory of the process is as follows:

The lime contained in the pores of the plaster decomposes the sulphate, with production of two insoluble bodies, to wit, sulphate of lime and oxide, which fill the pores of the object submitted to the treatment in question. With sulphate of zinc the object keeps of a white color, but with sulphate of iron the object, at first greenish, takes on drying and with lapse of time the color of the sesquioxide of iron. With sulphate of iron the hardest surfaces are obtained, the resistence of rupture being 20 times greater than with ordinary plaster. To obtain the maximum hardness and tenacity it is necessary that the object should first be very dry and steeped in a solution which is practically saturated. The first immersion of the object in the solution ought not to last over two hours, as a too-long immersion at first is apt to render the surface friable. On drying the plaster object afresh after the first immersion there is no further fear of its becoming friable. If the proportion of slaked lime is too great the surface is apt to take a very hard marble-like skin, which prevents the hardening of the inner portions of the object. The proportion of one of lime to six of plaster, as stated above, has given the best results.

Plaques made in this way can be browned by rubbing them with linseed oil and litharge, and glazed on the surface with hard copal varnish. A beautiful glassy flooring like polished oak can in this way be prepared.

A METAL DRILLING TOOL of new form has been patented by T. Sheffler, of Patterson, N. J. The cylindrical head of the tool which carries the drill is surrounded by two half-rings which rest in a groove cast around the head. A cam enters between two of the adjacent edges of the half-rings. A handle made with an eye at one end surrounds the head. This handle is provided with an irregular socket which receives the cam. On moving the handle to the right the cam forces the half-rings apart, so that the latter friction tightly up against the head and forces it around. On the reverse motion of the handle no strain is placed on the rings, and they simply revolve loosely with the handle.

TAPERING HOLES.—Some of the best bolt fitting is being done with tapering holes instead of straight holes. The holes are drilled straight, but are reamed with a reamer that is slightly tapering. The bolts are turned by fixed gauge to fit. The taper is really more than one one-hundredth of an inch—or on three inches, three one-hundredths of an inch—but is just sufficient to make a perfect fit when the bolt is home, and is enough to allow a slight tap of a hammer to start it back. Better fits can he made in this way than hy straight holes, and work can be put together and taken apart much more rapidly.

THE SAFETY OF CAST-IRON COLUMNS.—The Berlin police authorities, in consequence of unfavorable experiences with cast-iron columns in recent fires in Berlin, have lately issued regulations forbidding the use of such supports in the construction of dwelling-houses, but permitting the employment of columns of wrought-iron and Dutch brick in cement mortar. Cast-iron columns may only be employed if they are surrounded with immovable mantles of wrought-iron separated from them by an air space.

IMPROVED COTTON PRESS.—A Laurens county, S. C., man has invented an automatic cotton press which feeds from the throat of the gin, puts on and fastens the bagging and ties, and ejects the hale without the cotton being handled after passing into the gin. Immediately after the bale has been thrown out it readjusts itself, and without a minute of lost time goes on packing the next hale. The machinery is exceedingly simple and easily adjusted.

WOODEN HOOPS BY MACHINERY.—Machinery for making wooden hoops has been started at Williamsport, Pa., which are said to he far superior to those made hy hand, and orders received from New York already exceed the ability to supply. Machines will he set up at once in different localities through the State.

SCIENTIFIC PROGRESS.

The Durability of Dynamos.

The subject of the durability of a dynamo for electric lighting purposes has become a matter of quite important discussion, for the reason that on the life of those instruments depends to a considerable extent the "maintenance" or ultimate cost of electric lights. Their durability has been variously given at from two years upwards. A recent careful examination of several dynamos, which have been in constant use for from two to three years, under careful management, according to the *Mechanical World*, shows no material wear; while others, less carefully managed, show more or less wear of the commutator and collecting brushes. It is only in that portion of the machine that any considerable wear is likely to occur, and those parts should be removable, and replaced after material wear. The bearings should last many years—as long as a rapidly running steam engine.

In a properly constructed and well-managed dynamo there should he very little "sparking." Every spark means a loss of metal and, of course, wear. One dynamo brought to the attention of the journal mentioned, in one year's time had used five sets of brushes, which, of course, meant great wear. Another dynamo had been in the same kind and amount of use for upwards of two years and was still using the original brushes. In the first case, there was much "sparking"; in the second, no "sparking" was ever observed; the "wear and tear" of that instrument was practically *nil*.

From the above it would appear that the life of a dynamo ought to set at a very high figure, provided due care be taken of its hearings, and the adjustment of its brushes. Its cost of maintenance should be nothing more than an occasional pair of brushes and the renewal of the commutator.

The Flora of Bank Notes and Coin.

Science and Nature, a French journal has published an article entitled "The Flora of Bank Notes," from which it appears that bank notes are more or less covered with animalculæ, as well as coin, which latter fact has already been advanced to the world. From the article in *Science and Nature* we learn that M. Jules Schaarschmidt has followed out the investigations of M. Reinsch, who found, with the aid of the microscope, that two species of algæ adhere frequently to coins. Schaarschmidt has examined bank notes and found that the paper currency of various countries furnishes an abundant cryptogamic vegetation, as well as microbes.

Nature, commenting on the subject, remarks: "There is obviously a very serious side to all this, however, if further researches prove that, as appears possible, our most minute and dreaded enemies are always in our midst on such apparently welcome visitants as coin and bank notes, money will have earned a worse name even than it has heretofore. *En revanche*, there are two points which no doubt will be insisted on. In the first place, the observers named have not so far described any organism on the money investigated which is known to be inimical to us; and, secondly, precautions have been taken from time immemorial against the transmission of currency passing from a plague-stricken community to a healthy one. Possibly the facts derived from these observations will be made use of to bring more forcibly before the minds of our less careful brethren the dangers of handling "filthy lucre" in times of disease."

EQUALIZATION OF TEMPERATURE.—If several months in succession have been unusually warm or unusually cold, instead of concluding that the climate has permanently changed, and that the succeeding months will be similar in character, we should rather anticipate months of the opposite description, since the mean temperature of the year fluctuates within very narrow limits, and the longer a period of unusually warm weather continues, the greater is the probability that the succeeding months will be unusually cold. Predictions of this kind are legitimate deductions from scientific data. When we are restricted to observations at one locality, our predictions of the weather must needs be more uncertain, and the conclusions to be derived from a motion of meteorological instruments are not the same for all parts of the world. A considerable and rapid depression of the barometer, for instance a fall of three-quarters of an inch in 24 hours, indicates an approaching storm, with rain or snow. A rapid rise of the barometer indicates unsettled weather; a slow rise indicates fair weather. The result of all rapid changes in the weather, or in any of the instrumental indications, is brief in duration, while that of a gradual change is more durable. Remarkable clearness of the atmosphere near the horizon and an unusual twinkling of the stars indicate an unusual humidity in the upper regions of the atmosphere, and are therefore indications of approaching rain. Halos, coronas, etc., presage approaching rain or snow. Dew and fog are indications of fine weather.

THE PRODUCTION OF INTENSE COLD.—In his third lecture on "Natural Forces and Energies," delivered at the Royal Institution on April 30th, Professor Tyndall referred to some interesting news he had received that morning from Austria with regard to the latest development of a line of research inaugurated by Faraday. By reduction of temperature and increase of pressure Faraday had conducted the classic experiments which had led to the liquefaction of chlorine, and subsequently of other gases, but oxygen and carbonic acid and others resisted all the resources for producing cold and for exerting pressure which he could then command. Subsequently carbonic acid had not only been liquefied but solidified, and "carbonic acid snow" is not unfrequently made. It was but yesterday (said Professor Tyndall) that we heard from Switzerland that oxygen had been liquefied, and the news of that day was that it had been solidified. The experimenter was Professor Wroblewski, of Cracow, and the degree of cold employed was 365° C. below zero, when crystals of oxygen formed and a coating of ice covered the surface of the liquid oxygen. The greatest degree of cold known when Fahrenheit fixed his thermometer scale was by a mixture of ice and salt, only 32° below the freezing point of water being obtained.

COAL AND ITS FORMATION.—A scientist lecturing in Philadelphia on coal, said it takes a prodigious amount of vegetable matter to form a layer of coal; that it is estimated that the present growth of the world would make a layer only ¼ of an inch thick and that it would take a million years to form a coal bed 100 feet thick. The United States has an area of 440,000 square miles of coal fields; 100,000,000 tons of coal were mined in this country last year, enough to run a ring round the earth at the equator 5½ feet wide and 5½ feet thick, and there is enough coal in the United States to supply the whole world for a period of 1,500 to 2,000 years.

When the coal is burned for illuminating purposes, at least 90 per cent is wasted. In the heating of houses 67 per cent is lost, and in manufacturing 90 per cent of the energy is made use of. The question of the exhaustion of the coal supply is not important. The anthracite coal in Pennsylvania would last 250 years while the bituminous coal in the same district would supply the world 57 years and the United States 350.

CONSTITUTION OF CLOUDS.—M. de Tromelin attacks the hypothesis that clouds are composed of vesicles or hollow spheres of condensed vapor. He supposes that every solid body, whatever may be its diameter, retains around it by adhesion a special atmosphere of the gas in which it is plunged; that the thickness of this atmosphere, is nearly independent of the volume of the solid body; that the attraction which retains it is within the domain of the molecular forces and is manifested only within very short distances. In this way he accounts for the difficulty of completely removing the air from a tube which is to be filled with liquid. In the case of a vesicle surrounded by its atmosphere the thermal absorption of the water is much greater than that of the surrounding diathermanous air. The atmosphere of the vesicle is consequently expanded and the particle with its atmosphere floats hy displacing an equal volume of the circumambient air. The dust particles which are observed in the sun's rays are supposed to be sustained in the same way.—*Les Mondes*.

THE GREAT OBJECT GLASS.—A casting has been made of the crown glass for the great Lick telescope, which, it is thought, will be a success, after quite a number of failures. Such is the report brought hy Mr. Chas. Plum, one of the trustees of the Lick estate, who has just returned from Europe. It is said the failure of the previous castings has been on account of a change in the management of the glass works, the father having given up the management to the son, who was comparatively inexperienced. The father has recently gone back, and the result has been the restoration of their works to the former standard of excellence, and now we have the report that success has attended the last casting, which is being polished to facilitate a more thorough examination of its character. It is expected that it would soon be ready to ship to Clark's at Boston, who will give it its configuration, and they as well as the trustees feel quite sanguine that there will be no further delays. The object glass will be 36 inches in diameter, and costs $50,000.

ACTION OF DYNAMITE.—The recent trials of projecting dynamite shells hy the use of ordinary gunpowder and their wonderfully destructive action has aroused much curiosity as to the manner in which this powerful explosive acts—so different from that of gunpowder. It is explained that hy reason of its quickness of action the armor of a ship or the wall of a fort, in a word, the solid offers less resistance than the miles of atmosphere surrounding. This has been shown by a recent illustration. By placing 100 pounds of gunpowder on a hard surface, then applying a light to it, an explosion would of course follow, and the explosion would take an upward course; but should 10 pounds of dynamite he placed in a like position and exploded the action is so quick that after being fired it would tear up the earth for many yards around.

A NEW KIND OF FISH is said to have been found in the waters of the Suwanee river. They seem to be a cross between the salmon and shad, and are said to be of a fine flavor.

Passing Events.

The excitement in Arizona on account of the Indian outbreak is increasing, and the citizens are asking the Government for better protection than that afforded by the few troops there. A number of settlers have been killed and the Indians have not yet been punished.

Increasing interest is manifested in the gold-mining regions of California, and developments are being pushed at a more rapid rate than has been the case for some years. More prospecting is being done also, especially in the northern counties, where hundreds of men have gone this summer.

The cutting down of force in the railroad companies has thrown many persons out of employment, and this week further reduction has been made. Several of the officcs have been consolidated and some have been abolished.

Our correspondent who is traveling in Shasta and Trinity counties is gathering very interesting information for his weekly letters, one of which appears in this number of the PRESS. These letters are worthy of careful perusal.

MILLS' SYSTEM OF SHAFT SINKING.—In the articles on this subject which appeared in the PRESS of last week and week before, were one or two errors. In the second paragraph of the first column, page 761, the "flow" of the American valley should have been the "floor" of the American valley. On the tenth line from the bottom of the same column the word "forced" should be "passed." On page 377 (last week), in the second column, seven and eight lines from the bottom, the tranposition of the word "shos" confused the sense. It should read "the load was taken out of the barrel through the opening (*I*, Fig. 4), just over the shoe with" etc. On page 378, first column, fifth line from the top, instead of "one and one twenty-first" it should read "one twenty-first." These corrections should he made by those who are keeping the article for reference.

Yield of Auriferous Gravel.

The ordinary yield of the gravel channels in the northern counties of this State is from $40,000 to $50,000 per acre, though there are exceptional instances of much greater production—in one case at French Corral, Nevada county, reaching nearly $200,000. In the southern counties the gravel deposits are not so deep and the product has varied from $10,000 to $40,000 per acre. It has been estimated that it would take 50 years to work out ground already opened and controlled by the present canals and reservoirs, providing hydraulic mining had not been prohibited by the courts. It was judicially found in the Woodruff case, in which only the mining region on the tributaries of the Yuba was considered (although the principle affected all hydraulic mining), that "approximately, according to the evidence, over 100,000,000 cubic yards from these mines had been washed out by ths hydraulic process," and 700,000,000 cubic yards remain to bs washed out.

The basis of valuation of hydraulic ground predicated on returns per cubic yard has long been obsolete. Ths measure of value is ths product per miner's inch of water; this in some instances bas reachsd as high as 41 per inch.

The effective results of watsr on hydraulic hanks, determined hy close observation in 1882 at several leading mines, are thus tabulated hy Walter A. Skidmors, Secretary of the Minsrs Association :

Mine.	Water. Miners' in.	Earth Moved. Cubic yds.
North Bloomfield.....	2,800	11,200
Milton.....	3,300	11,400
Omega.....	1,500	7,500
Conly & Cowell.....	1,700	10,200
Excelsior.....	1,600	6,400
Chadwick & Campbell.....	1,200	14,400

These observations Mr. Skidmore says were made simultaneously, but the conditions were varying with respect to tbe consistency of the gravel. The result will show a duty of an average of five cubic yards per miner's inch in Nevada county, though this would include some top dirt.

The Strike at the Mayflower Mine.

We mentioned recently that a rich strike had been made in the Mayflower gravel mine, about a mile and a half northwesterly from Forest Hill, Placer county. Wonderfully rich gravel has been found. The mine has been skillfully prospected hy the superintendent of the Mayflower Company, Mr. Felix Chappelet. They own about a mile and a half on the main channel, which is probahly the same channel as that on which Breece and Wheeler are at work, as the gold is of precisely the same character.

They first started hydraulicking a hed of gravel 100 feet deep overlying white cement. They tnen sunk a shaft 150 feet, and struck gravel when they passed 50 feet. They then found a riu pitching east, and drifted easterly 500 feet through gravel. There they eunk shaft No. 2 about 82 feet throngh gravel when thsy came to bed-rock pitching east. From here they drifted southeast 500 feet and struck hed-rock—supposed to be the east rim. Winze No. 3 was sunk at a distance of 300 feet from shaft No. 2, and at 135 feet hed-rock was met. From the bottom of shaft they drifted east 160 feet and found the bed-rock pitching east.

A slope was sunk on the bed-rock, at about 18 degrees, a distance of 100 feet, and here pay gravel six feet deep was struck which yielded $400 per pan. In five days thsy took out 300 ounces. This is from hard cemented bluish-gray ground, containing quartz, trap, syenite and hard ribbon slate boulders. It is similar in all respects to that worked hy Breeee. & Wheeler, at Bath, about two and a half miles east of this ground.

Great difficulty was encountered in handling the water, during this most excellent piece of prospecting. First it was uecessary to place an 8-inch Cornish pump in the main shaft, run hy an engine on top; and also a steam pump. On shaft No. 3 water was hoisted by donkey. At the hottom of No. 3 they are using two steam pumps; and at ths hottom of the slope thsy also have a steam pump. The steam for all the pumps ie furnished by a boiler on the surface, and passes through a two-inch pips a distance of 1,300 feet, the pipe being protected with felt. A fan is used for ventilating. The mins is now in proper shape for rapid and easy development and the character of the gravel is such that the owners are sure of an exceptionally rich yield.

Since writing the above we learn that the mine is increasing its weekly returns at a rapid rate, it heing now over 1,000 ounces, with good prospects. It is the company's intention to run a tunnel to facilitate the work, and increase its returns. Mr. Chappelet, the superintendent, is quite energetic, and his management is highly complimented by thoss familiar with it.

A new company called the Live Oak Drift and Gravel Mining Co. has just started on a mine situated close to the Mayflower.

Growth of Gold Mining in California.

We infer from accounts that reach us through our own correspondents and othsr reliahls channels of information tbat the business of mining for the precioue metals is being fairly prospered in California, and that the pressnt, taken as a whole, is likely to prove a really good year for ths industry. Ths self-employers, who constitute a large proportion of our mining population, appear to he making at least average earnings, while those working on hire are receiving, if not very hig, certainly what are satisfactory wages, for a spirit of contentment seems to everywhere prevail. We hear of neither labor strikes nor complainings: pretty good evidence that all classes, employers and workmen alike, are acting in harmony; certainly that tbere exists no great friction hetween them.

In this husiness, as in every othsr, the measure of success is, of course, variahle: some make fortunes in a very short time: others make barely wages, while occasionally an enterprise proves wholly non-remunerative. On an average, however, gold mining in this State is paying hstter than any other hranch of husiness either here or elsewhere. And an encouraging feature of this husiness is that it is progressive: it is all the time improving; even in the matter of profit realized it is doubtful if it has seen its hest days; its great successes lie in th e future. We are persuaded of this is when we look ahout and see what is being done, and measure the possibilities of the situation. And others are persuaded of it. Hence this general waking up and these many silent movements of our capitalists, mining magnates, husiness men aud others in the direction of new and more extended mining operations.

Taking for data what is being done in Nevada county alone, or even in a single district in that county, it would denote for this industry a new departure and a more rapid growth in the future. In Washington Township and district, in that county, agencies have lately heen eet to work that must, in the couree of a year or two, materially increase the hullion product of this State. The records of that section of country hecome at this time instructive, not only for the light they shed upon the past history of quartz mining in California, hut becauss of their hearing on its probahle future. Here some of our most successful vein miners made their first efforts in that line of business, and here, after an absence of nearly quarter of a century, they have coms back to pursue it. Here George Hearst was working quartz in 1859, when the fame of the Comstock find caused him to suspend oparations and betake himself to other and new fields of enterprise. What he, in connection with Haggin, Tevis and other millionaires, has since accoinplished in ths way of securing and opening up valuable mines, we all know. The methods these men havs adopted, and which have contributed so much towards insuring success, are also well known; their plan havi g heen to always thoroughly prospect mines hefore huying them, and in no case to accept any property of this kind until i s valne had been pretty well established. In every instance where these men have bought and equipped a mine, it has turned out well. The fact that they are now largely interested in the Washington District, having already erected a mill on one of their claims there, the Yuha, argues well for that as a quartz mining locality.

That this quartz belt striking across the Washington and Eureka Districts is really ons of the most permanent and productive ever found in this State is ehown further hy the fact that every mine ever opened and supplied with plant upon it has made eatisfactory returns, some having heen worked almost continuously for over 30 years. Only within the past year or two, however, has any first-class mill heen put up, or much thorough and systematic work heen done. Ths following mills, nearly all of recent construction, are now running in the district: The Eagle Bird, 20 etamps—crushing capacity soon to be douhled—Shattuck & Co., of San Francisco, owners; mill and hoisting works run hy water, crushing 30 tons daily, average yield $25 per ton; cost extracting and milling, $3 per ton; 15-foot vein all good ore; opened to depth 200 feet, ore all from drifts, no stoping yet done. Yuba, 15 stamps—owners Hearst, Haggin & Co.; run hy water, raise and crush 30 tons daily at a cost of $4 per ton; yield, $25 per ton; 6-foot ledgs at a depth of 600 feet, all good ore, mill soon to he snlarged. Lindsay, 20-stamp mill, run by water, owned mostly hy Greathouse, Robinson & Bell, of San Francisco—old mins paid largsly for many years; strong vein of $20 ore, which can he cheaply mined and milled. Cornucopia and Secret Treasure, 10-stamp mill, owned hy English Company; 4 lodes, average width 8 feet, ore yields $18 per ton, mined and milled for $3; largs ore rsservss developed. Gaston Ridge, 10 stamps, owned hy locators and worked on lease; has been worked for 20 years and paid well; ore yields $15 to $20 per ton; strong vein at a depth of 100 feet, all ore; cost of extraction and milling, $2 to $3 per ton.

Besides the above there are two or thres small mills in ths nsighhorhood, with ssveral new ones of large capaoity, either projected or in courss of cons'ruction, it heing calculated that the number will be doubled inside of another year. While the mills already put up ars on such valuahls ledges as above described, thess latter do not in all cases embrace the hest properties in the district, as more recent developments tend to disclose. The Gamhrinas, formerly the California, sitnated on ths eminence known as ths Gaston Ridge. The Mountaineer located opposite the Eagle Bird and Yuha; ths Celia, adjoining the Eagle Bird on the south; the Crœsus, lying east of and close to the Yuha; the Selina group at the head of Little Canyon creek, and on the same range with the Yuha and Lindsay, and which undonbtedly exceeds either of these mines in value; the Serius, another unmistakably fine property, the Regina and the Excelsior, hoth yielding high grade ore in quantity; the Grant, a promising vein, situated on Phelp's Hill, and developed hy several tunnels, not to mention a dozen other gold-hearing lodes in the vicinity, all showing good prospects.

It should he stated that there is au ahundance of fine timber in this region, also water enough, much of it still free, to drive a thousand stamps or more. Machinery can he taken into this district at small cost, it having heen connscted with the Central Pacific Railroad by means of a narrow gauge track recently laid down by the Towle Bros.

Modern Mine Cages.

We have on this coast, in all well appointed mines, been so loug accustomed to hoisting in guided cages that we scarcely know how much of an improvement they are over ths old-fashioned skip. The rapidity with which hoisting work is done with these cages is one of the reasons why such quick work of development as we see is possible. To the modern cage is due much of the cheapness with which ore is mined in large quantities, as hy its means tbe material is readily and economically handled.

To show what a difference there is in hoisting by other means, the expsrience of one of the collieries in the Department of the Loire, France, may he cited. At the mine referred to it was the custom, until recently, to hoist from two shafts hy means of the old-fashioned skip; hut a new managing engineer advised the adoption of guided cages, and in a few months the change was affected. As the shafts were of small diameter, the cage was constructed with four stages to carry one tub eaeh. Now the whole of the winding is done through ons shaft with a larger output than formerly, and the results of the last three months' working with these new arrangements show a reduction of 2 fr. (1s. 8d) a ton, or about 18 per ccnt on the cost of production. The shaft is 440 yards in depth.

A Water-Gas Open-Hearth Furnace.

The following paper, by N. Lilienherg of New York city, was read at a recent meeting of tho American Institute of Mining Engineers:

The success of European experiments in melting iron and steel with gases resulting from the decomposition of steam hy incandescent coal, has encouraged me to design, with the valuahle assistance of Mr. George S. Dwight, a plan for producing and hurning these gases in a manner economical aud efficient for metallurgical purposes. That this direction is the right one, is demonstrated by the repeated efforts made in practice, to introduce as much steam as possihle with the hlast in ordinary producers, thus displacing a certain amount of nitrogen. Such attempts, however, must always bc limited hy tbe cooling influence of the steam.

The accompanying drawings represent the producers and the steel-melting furnace, arranged according to our first ideas which may be susceptihle of improvement in details when put into practical use. In the engravings the scale is the same, and the same lettering is employed for the differeut sections.

The apparatus contains two above-ground circular producers, *a*, *a*, provided with the ordinary hell and hopper for charging. The fire-hrick lining is contracted ahove and helow the middle. The upper parts contain outlets for the gas uniting into circular flues. The lower cones rest on cast-iron plates and circular pipes *b*, *b*, which are supported hy the angle irons *c*, *c*. By hanging these with the irons *d*, *d*, the entire ash-pit is left free from obstructions and can he cleaned through four doors. It is important to have this free space, especially when air and steam operate alternately on the coal, hecause the ashes partly melted hy the blast get cooled off by tbe steam, thus sometimes forming large lumps. The circular pipes, *b*, *b*, have continuous openings and aro united hy a hlast-pipo *e*, containing two valves *f*, *f*, placed at right angles and connected hy a lever-apparatus. The innor and upper edge of the circular blast-pipes can be protected, if necessary, by a pipe with running water.

In the lower part of the producers are two outlets, *g*, *g*, for the gases, which connect outside into the pipe *h*. They are alternately shut off hy the slide-valves *i*, *i*, connected hy a rod *k*. The hlast and gas-valves are operatod simultaneously hy the standing shaft *l*, having the levers *m*, *m*, *m*. The flues in the upper part of the producers are connected by an apparatus *n* similar to the slide-valve-regulator in a steam-engine, the valve *o* heing operated hy a combination of levers *p*, *p*, and a rocking shaft *q*. Steam is admitted into the chamher through the pipe *r*, and regulated hy a valve, whereby the admission of gas to the furnace is also regulated. Under the slide-valve runs the flue *s*, connecting with the pipe *t*, which terminates in a pit *u*.

It will thus he seen that in this position of the valves shown in the drawings, the hlast passes upward through the left-hand producer. The escaping gases, consisting of carbonic acid partly converted into carhonic oxide, and containing the whole amount of nitrogen of the blast, pass off at the top and run under the valve into the flue *s* and the down-comer *t*. On the other hand, steam passes ahove the valve into the other producer previously heated hy hlast; and the product, containing hydrogen, carhonic oxide and a trace of nitrogcn, passes off helow into the pipes, *g* and *h*. Reversing the valves hy means of two levers reverses the currents, the steam then passing through coals previously heated and the hlast through the coals cooled off by the steam.

There is consequently a constant supply in the pipe *t* of poor gas containing all the nitrogen of the hlast, and a constant current iu the pipe *h* of pure water-gas of high calorio power. By admitting air into the pit, or combustion chamher *u*, the carbonic oxide is hurnt, the flame passing off into the flues *v*, *v*, which constitute a heat-restorer. This part of the apparatus is constructed of 3-inch firebricks of 15-inch hight covered with two layers of 3-inch bricks, leaving channels of 9 inch width. The water-gas passes from the main flue down into the four channels marked "Gas," and is preheated by conduction through the walls. The air passing through the four chaunels on the opposite side is preheated in a similar way. It will thus he seen that explosions could not take place hy air and gas mixing through cracks in the hrick walls. The waste gases contiuue through the flues *v*, *v*, down into the chimney flue *w*. The air and water-gas continue their course and ascend into the flue *x* (See cut, longitudinal section), which is divided hy the wall *x* cross section C-D).

If these producers are somewhat more complicated than the ordinary ones, the melting-furnace is cheaper in construction than the Siemens regenerative furnaces. The superstructure consists only of four flues 1, 1, separated hy hrick walls and arches, 2, 2, with an opening 4, in the center. The air and gas flues communicate on hoth sides with the flue *x*, while the inner and lower channels open into the flue marked "waste heat" (at the right-hand end of the longitudinal section), whence the escaping flame passes through the channels 5, 5, in a way similar to the flow of the waste gases from the producers at the opposite end. It will thus he seen that the air and the water-gas in a preheated state meet under an oblique angle, creating an intensely heated flame, turned directly on the metal in the deepest part of the hath. From theuce the flame passes into the flue through the channels terminating in the chimney flue 6. The air and water-gas consequently pass toward the furnace through channels in which the heat gradually increases, as the furnace is approached.

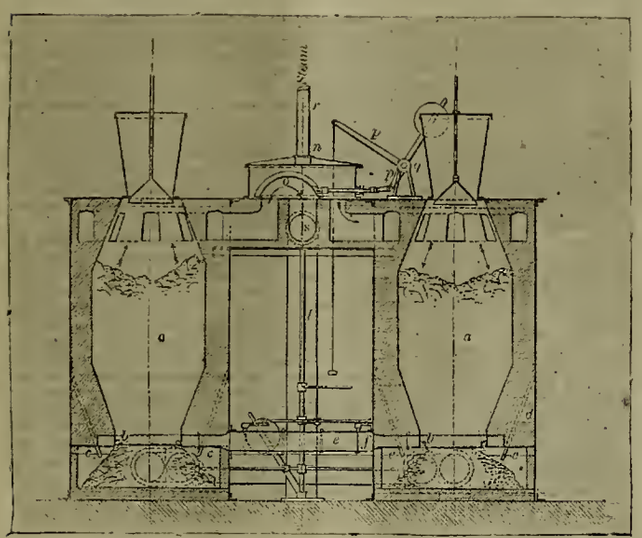
The repairs of the channels are affected by shoveling away the sand filling and lifting up the hrick cover. This is not much more work than hreaking through the walls in the ordinary Siemens regenerators.

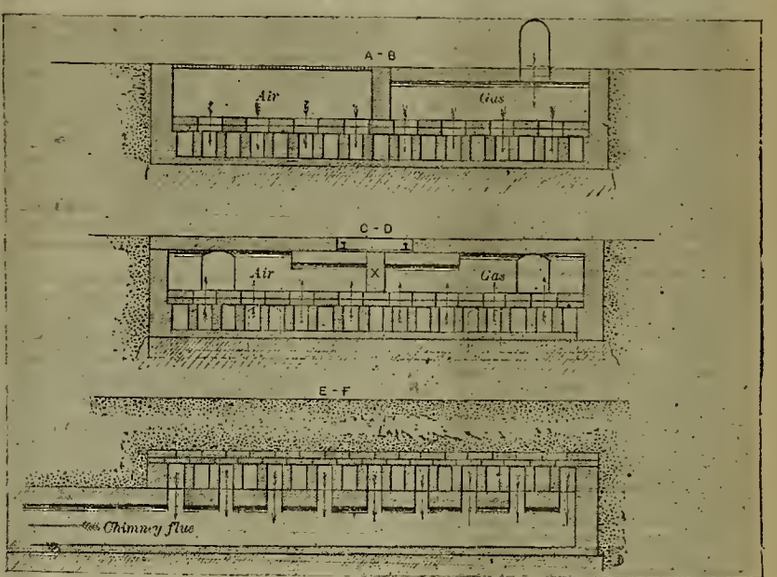
The space between the producers and the furnace is used for the transport of raw materials for the furnace charges. The furnace bottom is loose on wheels 7, 7, so that it can be easily removed and repaired. During the melting it is elevated on the two beams 8, 8, thus relieving the wheels from strain. By taking away some wedges it drops down on the wheels, disengaging itself from the superstructure. In this way it is also possible to use a hottom of hasic materials, hecause they do not come in contact with the siliceous superstructure.

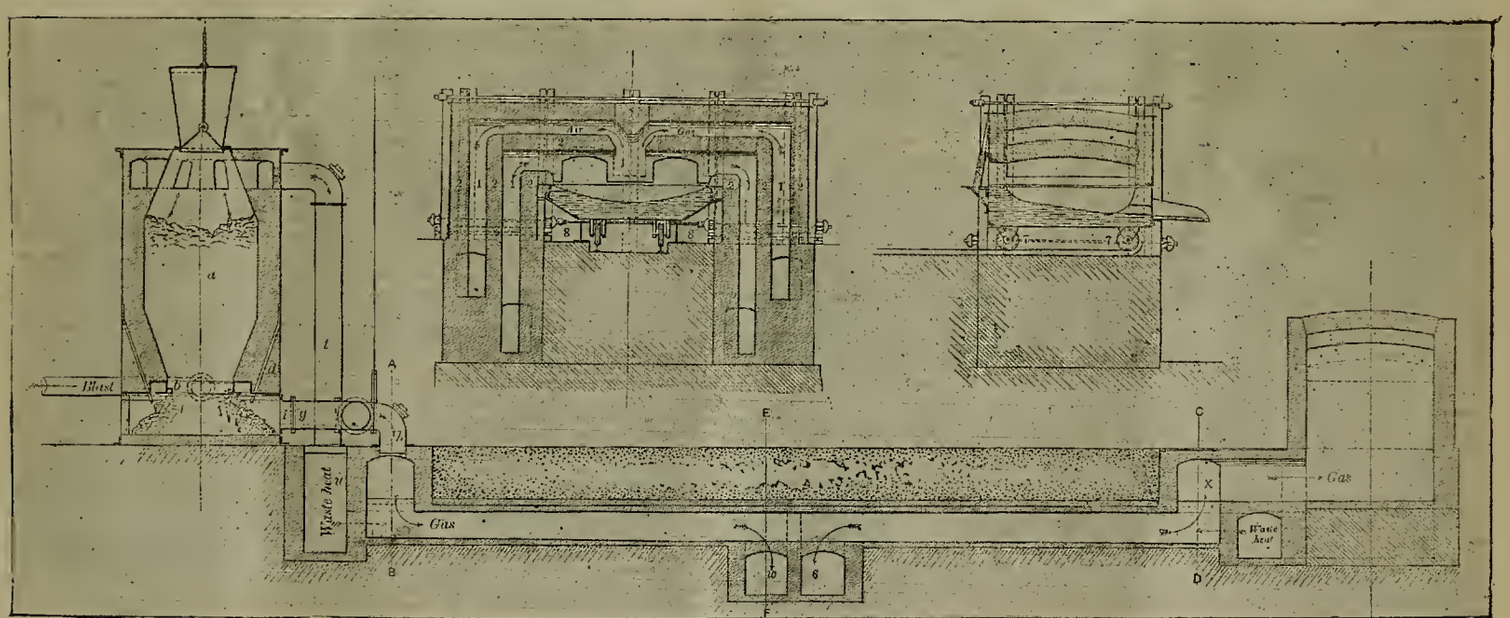
According to Mr. George S. Dwight's experience in producing water-gas for illuminating purposes, the most economical results arc ohtained hy a high pressure on steam and hlast, and hy short periods hetween the reversals.

If at any time the ordinary diluted gas charged with nitrogen (Siemens gas) should be preferred, one producer can he operated without reversing, openings heing made at a sufficient numher of points through the hrick wall hetween the two flues.

It is evident that the system can he used also for welding or heating purposes, in which case the air and gas can he introduced at the end of tbe furnace instead of in the center.







PRODUCERS AND STEEL SMELTING FURNACE TO BE WORKED BY WATER-GAS.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LIFTING APPARATUS.—C. Sanhorn, assignor one-half to A. T. Dewey. S. F. No. 319,132. Dated June 2, 1885. This is an improvement on that class of lifting apparatus known as "lock-pulleys." It was illustrated and described in the PRESS of September 13, 1884.

ORE CONCENTRATOR.—Norman Butler, Ennis, Montana, No. 317,621. Dated May 12, 1885. This concentrator is of that class in which the ore pulp is deposited upon shaking tables whose motion separates the particles of different specific gravities. A combination of devices is covered by the patent, so as to make an effective concentrator.

WHIP-SOCKET.—Cephas L. Bard, San Buenaventura. No. 318,531. Dated May 26, 1885. This whip-socket has one or more air-hulhs or cushions projecting within the harrel of the socket and adapted to bind upon the stock of the whip, and has a peculiar bearing plate in the hottom of the socket. The ferrule cannot chafe, and the whip-hutt is protected from water as it trickles down.

RAILWAY SWITCH.—George Chalmers, San Juan, San Benito Co. ,No. 319,067. June 2, 1885. This is a switch of that class in which levers in the road-hed are operated hy suitahle devices for the passing locomotive to throw the switch rails into or out of connection with the main or side track. The invention consists in a novel arrangement and construction of the levers in the road-hed, and in the novel arrangement of devices on the locomotive, hy which said levers are operated.

FOLDING-BED.—Benjamin F. Farrar, S. F. No. 319,083. Dated Juue 2, 1885. It consists of a sectional mattrass or hed, ths sections of which are hinged together at their meeting ends, of suitahle legs for supporting the foot and sides of the mattrass, and a swinging leg for supporting its head, and of a peculiar arrangement of rollers or casters at the head and foot to carry the ends of the mattrass sections in turning from one position to another, and to support them when folded.

PROCESS OF GRAINING SKINS.—Emil Schroeder. S. F. No. 319,136. Dated June 2, 1885. This is an improvement on that portion of the operation of tanning skins known as "graining." In the treatment of such skins as require to he turned out soft and pliahlc—notably, huckskin—it is necessary to remove the grain after the hair has heen sweated off. By removing the grain is meant the taking off of the outer layer of the skin to render the underlying surface somewhat similar to that of the inner surface, known as the "flesh side." Heretofore this has heen done hy the use of oxalic acid, which loosens the grain and allows it to he removed. In this improvement theungrained skin is swahhed with a certain mixture of acids which does the work more perfectly than the oxalic acid.

ADJUSTABLE ELEVATOR-SUPPORT FOR DERRICK WAGONS.—James Carleton, Willow, Colusa Co., assignor one-half to E. M. Tyler. No. 319,066. Dated Juue 2, 1885. This is a vertical frams, in the sides of which a cross-head or rest is mounted and adapted to be vertically adjusted hy means of an adjustable lever and connecting links, and in a supplementary axle provided with a bolster on which the vertical frame is supported; said axle being attached to the rear axle of the derrick wagon hy means of pivoted cross-reaches and a connecting har, wherehy the whole device hecomes a part of the derrick wagon and accompanies it. The object is to provide a permanent support for the elevator, adapted to adjust it to a suitahle inclination, and thus to avoid the lahor requircd to ship and unship the elevator and place it in position.

HEADER.—Chas. H. Deane, Hopeton, Merced Co., assignor one-half to H. C. Shaw, of Stockton. No. 319,075. Dated June 2, 1885. The essential novelty in this header is that ths draper-platform has a movement independent of the main frame. It is usual to hinge the post-heam to the main frame, and form the draper-platform a part of the frame. Then to adjust the sickle for a high or low cut the whole frame is moved on its wheels, as a fulcrum; but in this machiue the frame remains steady, and the draper-platform alone moves to an inclination. Therefore, it is not nscessary to hinge the post-heam to the main frame, but it can he secured solidly to it, so as to make a firm and strong machine. Then, again, having nothing hut the platform to adjust there is no great weight, and the lever can he operated easily, thus admitting of dispensing with springs and weights, which are ordinarily used to assist the lever in turning the whole machine.

MANUFACTURE OF BEET SUGAR.—Edward F. Dyer, Alvarado, Cal. No. 319,077. Dated June 2, 1886. This is an improvement in manufacturing beet sugar and in the treatment of molasses, wherehy the inventor ohtains an increased yield of sugar and greatly shortens the time of manufacture, saving the expense of hoiling in tanks for crystallization, the cost of expensive crystallizing tanks, and the expense of handling the low products. as well as the chemical and mechanical loss hefore it is converted into sugar. The ohject of the improvement is to separate from the molasses the greater portion of the matter therein contained, which prevents the crystallization of the sugar, and which cannot he removed hy the usual methods of manufacture. The inventor thus increases its purity co-efficient so that it may hs hoiled to granulation in the strike vacuum pan, and the entire sugar from the beet may be ohtained in one product.

HEAT REGULATOR.—Lyman C. Byce and Alzino Dias, Petaluma. No. 319,064. Dated June 2, 1885. This invention relates to that class of heat regulators in which an expanding and contracting substance is caused through an intermediate mechanism to govern or control the source of heat, wherehy the temperature of an apartment may he kept at a certain degree; and this invention consists in a novel channel or passage, in connection with the heat source, and adapted to divert the heat when necessary, a valve adapted to close said passage or channel when the heat is not to be diverted, and to open it when otherwise, and in a peculiar valve-operating mechanism affected hy an expanding and contracting suhtance, thermostate, or regulator within the apartment. The invention further consists in the application and location of these parts in connection with an incuhator, wherehy certain beneficial results are effected. The ohject is to provide a simple and effective heat-regulating device, which, though applicahle to any apartment, is specially applicahle to an incuhator.

STEERING MACHINE FOR HEADERS AND THRESHERS.—Wm. H. Parks, Jr., Marysville. No. 319,117. Dated June 2, 1885. This new method of steering headers and threshers consists in an arrangement of levers, pulleys and ropes, hy which the operator is enabled to stand in the most convenient position for seeing his work ahead, and from which he is enahled through the ropss to operate the steering-wheel. The ohject is to enahle the steerer to locate himself in such a position that his view of the field in front will not be obstructed hy the intervening machine, and at the same time give him the necessary means hy which he can govsrn the steering wheel. In machines of this class the thresher portion is usually so cumhersome as to entirely cut off from view of the steerer the work ahead, and he is under the necessity of guiding his one-horse by signals given hy other persons. This is a great disadvantage. Mr. Park's invention contemplates the location of the steerer upon the platform of the header portion of the machine, in which position he is at one side of the thresher portion and can see through the header portion, which is generally of such light frame-work as not to ohstruct his view.

OAKLAND HARBOR.—The failure of Congress at the last session to provide for the prosecution of work on the river and harbor improvements of the country will seriously delay the completion of the various projects under way, and will cause considerahle loss to the Government. When the usual annual allowance is withheld, the engineers are compelled to curtail the lahor required under each plan, as it is necessary to retain a portion of the money on hand to meet any sudden contingency, such as damages caused by floods, and also to provide for the preservation and care of the engineering plant needed to carry ou the work of improvements. Of course the rivers and harhors of California will suffer with the rest hy this delay, and the large commercial interests involved must of necessity he seriously inconvenienced. First as to the Oakland harhor. The original estimate for this improvement was $1,814,529.20, of which amount there has been already heen appropriated $874,600, leaving to he yet provided for the completion of the project $939,929.20. In reference to future Congressional allowances for carrying on the work at this point the engineer says that "these operations are of considerahle magnitude and can he hest prosecuted hy appropriations equal to the yearly estimates. Small appropriations prevent economical working. At the present rate of appropriations it will require ten years to complete the work, which could he well done in three or four years." An appropriation of at least $300,000 will therefore he asked of the next Congress, which, if granted, will he applied mainly to increasing the tidal prism by continuing the dredging of the tidal hasin or hy heginning the excavation of the San Leandro canal. The depth of the entrance is 14 feet. The original depth beforc the improvement was hegun was 3 feet.

REDUCTION WORKS.—The Pioche *Record* gives the following practical remarks on this suhject: "This part of the country is in need of reduction works; works that can work ore that assays from $30 and upwards. There are large quantities of ore along the range, but as there are no works for its reduction it is of no account. The $60 ore is not worth extracting for the miner can get nothing for it. The buyers cannot afford to purchase it and ship it to Salt Lake for reduction. They can afford to purchase none but ore of high grade. Reduction works for the working of low-grade ore, located down ahout the Eight-mile House, that would deal fairly with the miners, would yield an immense profit to its owners. The mines along the range from Stampede to Bristol Divide, would be worked and the reduction works kept busy, hut at the present state of affairs men are unahle to get anything for ore that assays less than $100. If it be true that it pays to work $12 ore or less in Colorado, we know no reason why from $30 to $60 ore should not pay in Nevada.

Lower California Copper.

The Butte *Inter-Mountain* says: News has just heen received in this city of the purchass, hy a French syndicate composed of some of the Lexington officers and Baron Rothschild, of London, of a vast tract of copper country in Southern California, on the east side of the hay of California, opposite Guaymas. The country embraced within the purchase is four miles wide and fifteen miles long, and is trasversed longitudinally by three great ledges carrying 12 per cent copper, which occurs as carbonates and oxides, in a sandstone formation. The property was examined last June hy Mr. Wartenweiler, of ths Lexington company, and hy Messrs. DeLahouglise and Cumence, other well-known mining engineers. The amount paid for the property is not stated, hut the sale is reported to he one of the heaviest made in Europe this year. A smeltiug plant will he at once erected to trsat the ore and a copper product of 12,000 tons per annum is promiscd. There is hig money in the enterprise, as English coke can hs laid down at the mines for $9.75 and other transportation will be comparatively low. It will probahly be fully a year hsfore the company will he ready to msrket its product. It is stated that Mr. Wartenweiler has made a handsome stake as a result of his participation in the enterprise, hut with his accustomed modesty he denies this assertion and refuses to make any statements for puhlication.

DEEP BORING.—The artesian well at White Plains, Nevada, is down over 2,300 feet, and can go no further until the water is shut out. It is 17 per cent salt, and is so heavy that the rope and tools float in it, and the drill does not penetrate the rock. All attempts at shutting it out have failed thus far. The Reno *Gazette* says that the msn are now at work on the last resort. It is an ingenious contrivance, consisting of a hollow cylinder of two-inch ruhber, two feet long and of a diameter sufficient to fit around the iron pipe. This is put on the pipe a foot or two from the hottom, at a joint. When it goes down into tho well, the tons of pipe above it press down and expand it, filling every crevice in the well completely, and shutting off all flow, up or down, outside the pips. Then if the rock is not porous or full of crevices, there is a good joh. Mr. Chapin and his assistants are interested now in this question, for upon it depends success. They have put down the pipe once, hut the rubber came off last Saturday and is at the hottom of the well. They have heen fishing for it ever since, and got out two pieces yesterday. Thsy are going to put the pipe down again and fish the ruhher up through it. An iron with harhs on it is used for fishing. The pipes are 4½ inches in diameter, and 1,890 feet long. It is lowered into the well and the points secured on as it goes down. The hig rope hroke on Monday near the reel, hut caught in the hlocks, so the end did not go down in the well. A new rope 2,500 feet long is needed. They cost nearly $1,000 apiece.

CONCENTRATING.—In Inyo county 100 tons of lead ore were recently concentrated down to 20 tons at a very small cost and nearly all of the precious metals retained. The papers of that county say that the concentrating proccss will soon he extensively adopted in that section. The same system will be ultimately adopted in this section. There are hundreds of ledges that yield rock which gives an average assay of ahout $25 per ton. A working test returns say $10 per ton in gold and the remainder goes off in rich iron and lead sulphurets with the tailings. It costs $5 per ton to mine this ore, $2 per ton to haul it, and $5 per ton to mill it. The rcsult is that either the miner, the teamster or the mill man must lose $2 on every ton worked. One or two dollars additional expense would concentrats these tailings as they pass from the battery. Ten tons would therehy he reduced to one, worth $100, and which would probahly nst the owner $60 or $70. Then, instead of losing $2 per ton, they would he making a profit of $3 or $4 per ton, and this seemingly small amount is what decides the fate of many a flattering prospect. It will not he many years until the hills will he full of small mills, cousisting of a hattery, plates and concentrators, in active operation. In many places the free gold taken from the plates will pay all expenses, and the proceeds from concentration will be clear profit.—*Carson Free Lance.*

Helena, M. T., business men are planning to have a smelter there. Committees were appointed to ascertain facts and figures from the various mineral districts in the vicinity of Helena, to find the probahle cost of erection of a first-class smelter, and to generally interview merchants and mining men on the subject.

A large party of citizens from Central City and Georgetown, N. M., is now searching on the east side of the Mogollon range for the Adams diggings. Seldom a year has passed but what parties have left in search ot these fahulously rich diggings.

HOW FUTURE FORTUNES ARE TO BE MADE.—More money will he made in mining during the years to come than has heen made up to ths present date. The manner of making it, however, will he vastly diffsrsnt. The great fortunes so far acquired have resulted largely from fortunate sales rather than from the profits of mining and shipping ore. Lucky strikss and extremely rich showings have enabled owners to sell for millions where thousands only have heen realized hy careful work and systematic development. To such an extent has this heen the expsrience regarding even our most celebrated mines that it has come to be understood among capitalists that the price of mines are usually placed altogether too high, and that when a man talks ahout millions it is best to let him have time to cool down. It is safe to assert that there are few mines in Colorado actually worth a million dollars, and that those few are yearly decreasing in number. No propsrty is worth so much money unless it is an annual shipper of nearly half a million dollars' worth of ore, and in addition has such vast reserves as to guarantse a certainty of equally large shipments for years to come. The owners of mines which produce so largely cannot afford to sell for what they are really worth, nor can the buyer afford to pay the figures asked for them. Sales are and will hs confined almost exclusively to smaller properties at reasonable figures. The money will be made hereafter, not from sales so much as from ths profits upon ore taken out, and consequently fortunes will be accumulated more slowly. They will come, however, more certainly than heretofore, and will bc as magnificent as any produced by the great industry in the years that have gone by. The man has a fine business and is in the way to acquire a fortune who is making $10,000 per year. It would be a poor mine indeed which does not net its several ownsrs larger profits than this. It takes capital to carry on a profitahle business of any kind; we will wager that it would take no more money to carry on the working of a mine which would net its owners $10,000 each, than a business enterprise of any other kind which would produce like profits. There is money in mining for the men who are willing to make it comparatively slowly, and with as great lahor of hrain and muscle as thsy would expect to exercise elsewhere.—*Rocky Mountain Mining Review.*

MINE GAS..—The quantity of gas which escapes from the faces of work in fiery mines in one year is amazing. A German mining engineer has heen making some measursments and calculations relatively to this emission of firedamp in mines not subject to blowers. He estimates that from the Nieu Isehohn Collisry there is given off annually ahout 320,000,000 cuhic fes t of carhuretted hydrogen; and that tho seven most fiery mines of Westphalia yield in the aggregate an annual quantity of not less than 1,380,000,000 cuhic feet. This is an enormous quantity of a useful gas to throw wastefully away into the atmosphere. If it could be conveniently collected it would furnish fusl in the most economical form, and would hecome a profitahle product of the mines. The time may yet come when this gas will be made availahle.

UTILIZING WASTE HOOP IRON.—A msthod of utilizing waste hoop iron hy forming it into hands for hunching shingles has heen patented by W. E. Harris, of St. Louis, Mo. The waste hoop iron is heated and then passed hetween ths working edges of a lower plain and an upper flanged roller. These rollers rsduces the metal to the proper thickness, while the flanges on the upper roller cut it to the required width. Pins or projections on one roller entering recesses in the other roller perforate the strip near each end. The strip is cut off hy a transverse knife on one of the rollers. The claim of the patent covers the method of utilizing waste scrap iron, which consists in passing it in a hot condition through rolls to reduce its thickness and width also to perforate it and cut it to the required length.

THIS IS THE WAY SOME ONE PUTS IT.—One of our exchanges says the English lion and Russian hear have postponed the fight for the property of another nation, in which they seemed ahout to engage recently, and aro now trying to get the hetter of each other through diplomacy (that is, raising a big smoke, under cover of which each hopes to beat the other in grabhing goods neither has any right to lay hands on).

THE GREATEST DRAWBACK to the use of natural gas is the fact that it is inodorous. Hence if there is any leakage, it may accumulate to a dangerous explosive extent hefore the leakage becomes known. It is from this peculiarity that the many destructive accidents have happened. To remedy this it is proposed to odorize it. Experiments to this end are now in progress in Pittsburg.

THE Virginia *Chronicle* says it is estimated that there are 3,800,000 tons of tailings in Storey county that will assay $4.50 per ton, representing a total value of $17,000,000. If these tailings were close to the Truckee river they could he worked at a profit hy running them through large pan mills run hy water-power.

LEACHING says the Pioche *Record* is pretty much all the go in that vicinity. Some claim to do pretty well, but we are of the opinion that no person is rapidly hecoming wealthy at the business.

ENGINEERING NOTES.

PROPOSED TUNNEL FROM THE CANADIAN MAIN LAND TO PRINCE EDWARD'S ISLE.—As one of the terms upon which Prince Edward's Island entered the Dominion, the Canadian government were to keep up a continuous steam communication between mainland and island, water and summer. This part of the union the government has failed to carry out, and the British government has been appealed to. Senator Howland believes he has solved the difficulty, and has submitted to the Senate plans and profiles of a scheme by which steam communication may be carried on all the year round by a system of tunneling such as now runs under the Clyde, Severn and Thames, and which has been favorably reported upon by Vernon Smith, C. E., well known in engineering circles in America and Great Britain. The total distance from Cape Tormentine to Cape Traverse, the two terminal points, is eight and a half miles. Between these two points are the Straits of Northumberland. It is proposed to run a tunnel composed of metal cylinders three-eighths inches thick, 15 feet in diameter, lined with concrete two and a half feet thick, giving a clear passage way of 10 feet, through which cars may be drawn by fireless engines; also to run piers out from the mainland on the New Brunswick side 10,000 feet, and from Prince Edward's side 4,000 feet. To reach the bottom of the straits, which at the ends of these piers is 20 feet below water level, a cylinder will run down a gradual incline. Ventilation will be secured from a shaft sunk about half way across the straits, at which point the water is 90 feet deep.

RAILWAY PROGRESS IN THE AFRICAN DESERT.—The *Times* correspondent in the Soudan telegraphs as follows: "The construction of the railway is a curious and interesting sight. In advance is a picket of cavalry, while far off on either side the vedettes scout in the bush. At the immediate head of the line is a battalion of infantry echeloned, and advancing as the rails are laid. Streams of coolies carry the sleepers from the trucks, and teams of four artillery horses drag up the rails, two at a time, to the navvies, who lay them in a twinkling, and drive the spikes. In the rear are gangs who complete the line, and further back the ballasting parties."

THE PANAMA CANAL.—A newspaper correspondent at Colon says, respecting the Panama Canal: "The greatest difficulties of construction have not as yet been grappled with at all. At Culebra the summit, where a cut 260 feet deep will be made to tide water level, only about 15 feet have been excavated. The great dam which it is proposed to build between the hills of Obispo and Santa Cruz to control the waters of the Chagres has not been begun, nor has spade been put to all those sluices and channels which are to be built to carry off the waters of the turbulent river in the rainy season."

A CONCRETE BRIDGE ERECTED IN A SINGLE DAY.—The contractors for a canal in Germany, having occasion to cross a much-traveled highway, after completing the waterway, constructed a concrete bridge over the same in one day. The span was 39 feet, and total weight between abutments 194 tons. The work between the abutments was done between 6 A. M. and 6 P. M., by 65 men.

WONDERFUL ENGINEERING PROJECT.—One of the boldest engineering projects yet proposed is that of throwing a bridge over the Straits of Messina that separate Sicily from Italy. A place where the channel is two and one-half miles wide and 361 feet deep is selected. Two piers will support a viaduct of steel rails to a hight of 328 feet above the water.

A NICELY BALANCED BRIDGE.—Every part of the North-side bridge, Pittsburg, is so nicely adjusted that a few days ago one man with a 15-inch wrench raised the whole structure over an inch. The strains put upon it cause it to sag now that it is new, and the application of the wrench to raise it to its correct position is necessary every few days.

THE AFRICAN INLAND SEA.—French engineers are about to begin further surveys in relation to the proposed African inland sea, with the twofold view of constructing a barbor at the mouth of the Oued Mellah, and of ascertaining the feasibility of sinking artesian wells along the proposed line of the canal.

ENGINEERING SKILL in China has achieved a notable triumph in the bridge at Lagang, over an arm of the China Sea. This structure is five miles long, built entirely of stone, 300 arches 70 feet high, the roadway is 70 feet wide, and the pillars are 75 feet apart.

TO RESTORE COLOR.—It is customary to use ammonia for the purpose of neutralizing acids that have accidentally or otherwise destroyed the color of fabrics. This must be applied immediately or the color is usually imperfectly restored. After careful use, an application of chloroform will bring out the colors as bright as ever. Plush goods and all articles dyed with aniline colors, faded from exposure to light, will look as bright as ever after sponging with chloroform. The commercial chloroform will answer the purpose very well, and is less expensive than the purified.

USEFUL INFORMATION.

A NEW MATCH-MACHINE.—Two Troy men have invented a machine which it is claimed will practically revolutionize match-making. It has been operated to make 54,000 perfect matches in a minute and its capacity is expected to reach 15,000,000,000 in 10 hours. The veneer of pine wood is fed upon a small platform and passed between rollers, which partly cut it crosswise the match. From the rollers the veneer passes over the abrupt edge of a coacave where the splints are caught by a rubber roller separated by the action of the roller and rubbed along over the concave so that all the adhering fiber is removed. Then the splints are carried by a chain from which they are forced into a dipping web or strip of paper. The web containing the splints is then conveyed into a trough wherein by the action of a revolving wheel paraffine is put on the end of each of the splints. When the paraffins is dry by passing through a heated chamber, another wheel revolving in a phosphorus composition applies the composition to the ends of the splints and the webs pass the reels where they remain until dry.

CUTTING THINGS UNDER WATER.—When science was in its infancy, says the *Scientific American*, much of its fact was mixed with nonsense, and some of the nonsense shows a wonderful vitality. A case in point is the recent publication of a nonsense bit that was current at least forty years ago. It is a recipe for cutting glass with shears or scissors. The statement is that sheet glass can be cut with the greatest ease with a pair of scissors if the glass is kept under water and kept in a level position. That there is not a word of truth in it any one may easily prove on a trial, with the result of dulling a pair of shears. There is one cutting process that can be better done under water than out of water; that is, the paring of onions. When pared under water the acrid emanations, so unpleasant to the mucous membrane of eyes and nose, are dissolved or held in the water. But neither the quality of glass nor the power of scissors is changed by immersion in water.

THE LATEST IN EXPLOSIVES.—The latest thing in explosives is blasting paper. Dynamite, it is claimed, is nothing to it, and it can be made at so small a cost that the present condition of the dynamiters' treasury would suffice to furnish enough of it to blow the whole country into "smithereens." It is a patent of a Viennese by the name of Petry, and is now coming into use in excavating for building purposes. It is made of common blotting paper. The paper is coated with a hot mixture composed of seventeen parts of yellow prussiate of potash, seventeen parts of charcoal, thirty-five parts of refined salt, seventy parts of chlorate of potash, and ten parts of wheat starch, added to 1,500 parts of water. The sheets are dipped in the boiling mass and dried. Then they are cut into strips, which are rolled into cartridges, and the article is ready for use.

ZINC AS A SUBSTITUTE FOR LITHOGRAPHIC STONES.—Zinc plates are now being used as a substitute for lithographic stones in some of the largest establishments. Praag has used them for ten years or more, and claims that they are fully equal in any respect to stone. It is much cheaper and more convenient. Mr. Prang says if he had not used them, he would long ago have been obliged to add another building to his already extensive establishment. It is expected that this substitution especially for large plates, will soon cause an important reduction in the price of lithographic stones, which are now very high because of their scarceness.

THE LETTER F.—For centuries the inoffensive letter f—inoffensive, even if it does always begin a fight—has been compelled to go through the world with a crooked back, as if it were obliged to bear the sins of all its fellows. Of late, however, the founders have been making fonts where the f is allowed to stand erect, without an ugly kern on the end of its face. When this is done with all fonts, we can discard the fi, ffi, fl and ffl, gaining room for other logotypes, more frequently used.—*Paper World.*

THE OLDEST LIVING THING.—What is said to be the oldest living thing upon the globe is the cypress of Santa Maria del Tule, in the Mexican State of Oaxaca. This venerable monarch of the forest, still instinct with apparently strong life, probably spans the whole period of written history. It is still growing. Humboldt speaks of it in 1851 as measuring 34 feet in diameter, 146 feet in circumference and 282 feet between the two extremes.

FIXING PENCIL MARKS.—Probably the best and most convenient way of fixing pencil marks is to immerse the paper containing the markings to be preserved in a bath of clear water, then flow or immerse in milk a moment; hang up to dry. This treatment will preserve both the ordinary pencil marks and crayon drawings as well.

WHITE LEAD produced by the Dutch process is said to have a higher specific gravity than that produced by other methods. A description of this process is given in standard works on chemistry. It is the process by which lead is largely produced in this city.

GOOD HEALTH.

The Cholera.

My Experience With It and the Way to Avoid It.

[Written for RURAL PRESS and *Cleveland Leader.*]

Our physicians see the "dark shadow" of the cholera approaching this country. They know the rapidity with which this disease spreads and also the direful results of a visit of so *terrible* a pestilence, and have been sending out warnings from time to time, recommending measures that should be put in practice throughout the country. We have been told hundreds of times that "what is everybody's business is nobody's business," and that explains the practical indifference with which these warnings have been received. The people forget that what is done for the general good of all is also for the good of the individual, and overlook the fact that a wrong to the individual reaches out to the mass and lays a tax less or great upon all. One, dying with the cholera, endangers the life of many. The time is getting short for preparation, and unless each performs the part of one, summer will get here too soon to avoid the danger.

The work to be done is only the work which should be done for the improvement of the general health of the people, whether the cholera comes or not. It is a duty that each should perform a share of at once. It is accorded to us as wisdom, if we possess the requisite sense, to profit by the mistakes and the experiences of others. I know the danger from the cholera, for I have seen it. Turning back the pages time has written o'er for me, I find an experience, which, to adopt the words of Victor Hugo, "is more than opportune. It is imperative I publish it."

My Experience.

It is a very simple tale, yet from it those entirely inexperienced may gather sufficient "light" to avoid much of the danger from this source.

This experience takes me back to the home of my childhood, which was in Brooklyn Center, known as Brooklyn Village, a small town adjoining the city of Cleveland, Ohio, on the south. My parents lived there and I lived with my Uncle Deming and Aunt Mary W. Brainerd, on their farm, two and one-half miles west of the town. Aunt Mary was my mother's sister and had no children. She was known to be an excellent nurse.

The cholera was brought there by Mr. James Sawtell, Sen., an old gentleman who had been on a visit to his daughter in Illinois. Though warned of sickness on the Ohio river, he decided to take the river as far as Cincinnati on his route home. There he took the cholera, and reached home but a few hours before his death. His wife was taken soon after. One of the sons came for my aunt to help them. It was very early in the morning when she called me and gave me directions about the baking and work of the day, and without waiting for breakfast rode away. As I stood and watched her going I knew nothing of the danger she was going into, or of the trouble coming to us. I worked all day as though unseen hands were guiding me. I put he whole house in order, got the meals and had success with the baking. This was in July of 1852, when I was not yet fifteen years old.

On arriving at the house, Aunt Mary went immediately into the sick room and began the battle with death in the form of Asiatic cholera in the worst type. There she with others labored the whole day, the disease gaining on them, and at 5 P. M. hope had failed them, and in the night Mrs. Sawtell died. Only the necessity of immediate action had caused Aunt Mary to enter the sick room with an empty stomach. An hour or two passed before breakfast was announced, but before that, feeling faint, she drank a glass of water she found standing in the sick room, believing it to have been just brought in. She learned, on inquiry soon after, that it had been standing there some time. She knew then that the water might have gathered impurities, and took measures to counteract any bad results that might follow. As the day wore on she became conscious of the fact that she had taken a serious risk, and by 5 o'clock was too sick to stay longer. She reached home about 6 o'clock. Anxious always for the comfort of others, she said: "My child, how did you get along with the work without me to-day?" I replied, "Pretty well, auntie," and then she said, "I am so glad, for *I am sick.*" It was certain she had taken the disease. It gained ground rapidly, and though all was done that we could do, she sank steadily through all the changes of the disease, and died before noon the following day.

I will not try to describe the disease. It has been done repeatedly in a better manner than I could do it. We labored for warmth both inwardly and outwardly, and were compelled to hear her call "hot," the only word she could speak towards the last, and we were unable to get any warmth to take effect. No words can describe the horror of such a death. Among the women who came to lay her out was Mrs. J—— S——, a true friend and neighbor, who gave me the following recipe as a preventive and charged me with true motherly kindness to be very careful in all ways, but if I felt any trouble in my stomach, to take:—

One teaspoonful common salt, one teaspoonful ground black pepper; put them in a teacup, and stir in good cider vinegar until the mixture would pour (some three or four tablespoonfuls), and take a teaspoonful once an hour, as long as any trouble was felt.

I felt no trouble until near midnight, when I got up and compounded the mixture and returned to my room. I took one dose, went to bed and slept until morning. I took another then, and one or two doses a day for three or four days. I had no more trouble.

My aunt died on Thursday. We laid her to rest on Friday morning, not postponing the funeral, as nearly all the friends were badly frightened by the presence of the cholera in the vicinity. Even the physician we called showed fear. I returned with my uncle and tried to make the house home-like. Uncle buried, at a distance from the house, everything soiled in the sick room, which in the light of later knowledge, was a questionable proceeding. He wandered around, in and out of the house, like one bewildered, and seemed to have lost everything desirable in life, even the wish to live. He neglected to use the preventive, and that night was taken down. From the first he felt he should not get well. Three brothers of my aunt were with us; they went to work with energy, but they only postponed the time of his death a few hours. Could make no headway against the hold the disease had upon him. He died Sunday morning.

Saturday morning, my father then a notary public, was called to write a new will. He did not think it right to leave me long exposed to the danger, and so took me home. Thus the house was left without a woman to aid in that fearful struggle with death. But those were competent men for the situation; they used the preventive and were not afraid. The disease ran in different directions until fourteen deaths were counted against it, and then it was subdued. The two sons of Mr. Sawtell, James and Ira, whose homes were in Cleveland, both died. Sanitary conditions were comparatively good, and had a knowledge of this preventive been general, there would have been less trouble. It was little known; my aunt knew nothing of it. This preventive seems to kill the fermentation in the stomach at once; it warms and restores the natural action of the stomach, and is followed by no unpleasant conditions. It is also a remedy that one is not likely to take an over dose of, though when in need of it, so far as I know, no one ever objected to take it.

I have never seen the cholera since that time, yet I have used this recipe nearly every summer in my family since it was given to me, to restore the healthy action of the stomach, and in cases of cholera morbus it works like a charm. It has never failed once to give immediate relief. The youngest case of cholera morbus was our little daughter, then eight years old. She was taken in the night very severely. I gave a half teaspoonful of the mixture, and in half an hour another, at the end of the hour another, and left her soon after asleep. In the morning gave hot milk and dressed her warmly.

The whole array of so-called summer complaints are cold diseases, and need especial care in dress. I have been careful in giving names, place and time, for the reason that there are many living in that vicinity who will remember the excitement caused by the facts I have related.

I have read the article in the March number of the *Century Magazine*, "An Unwelcome Guest." I venture the opinion and think the facts will support it that cholera is not a disease of the nerves. Our physical organisms are worked by the nervous system on very much the same principle that railroads are run by telegraph. The nerves are busy in sending in reports of the progress of the disease, but the seat of the trouble is not in them. Fear paralyzes the action of the nerves to a greater or less extent, and places the person so affected in greater danger. Its action is like opening the gates of a besieged city and inviting the enemy in. Exhaustion of the nervous force, from any cause, is alike dangerous. Indifference as to whether one lives or not places an almost insurmountable obstacle in the way of recovery. Anything that reduces the resisting force of the body against disease, anything that tends to injure the general health, is a source of danger—and therefore sanitary measures are a necessity.

Before closing this article, I wish to recommend an arrangement I have seen in practice on a farm near here, to take the place of the condemned privy vault.

To a large drawer some 15 inches deep, made water-tight on the bottom, are attached runners like those of a sled or small rollers. This is well lined with dry soil and pushed into place from the back of the privy. The contents are kept covered at all times with dry soil, wood-ashes or lime to absorb the odors.

As often as necessary, the horses are hitched to coupling irons on the back edge of the drawer and it is taken to the manure pit and emptied, the contents mixed with muck, to be afterward used on land intended for corn. The drawer is relined and replaced. This arrangement permits of no waste and preserves pure both air and water.

MRS. M. P. CUNNINGHAM.

Clyde, Sandusky Co., O.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—Amador *Ledger*, June 10: This mine continues to develop in a satisfactory manner. The ore bodies in places are 20 feet wide—plenty of ore to keep a 20-stamp mill constantly going. The new hoisting machinery is working like a charm. The contractors for sinking the shaft 100 feet deeper have got through 70 feet, and expect to get through with the job in about two weeks, when a new level at the depth of 700 feet will at once be opened up.

SUTTER CREEK.—The water is once more out of the Mahoney mine. As soon as this was accomplished W. A. Nevills and Captain Nichols came over, and went all through, making a thorough exploration of the lower levels. This took about half a day. They have gone below to report to the parties who are thinking of purchasing. Before leaving they informed us that it would be a week before anything definite concerning the success or failure of the negotiations would be known. A portion of the Eureka mill will be started in a few days on rock from the Median mine, near Amador City. The crushing will consist of about 100 tons, intended to test the milling quality of the ore. A part of the Mahoney mill has been started on rock from the Wabash. The ore seems to be of good quality, and is expected to turn out handsomely.

Butte.

SPRING VALLEY.—Oroville *Mercury*, June 8: Cherokee is booming. A trip to that famous mining camp on Sunday convinces us the mine there, and smaller ones in that vicinity, are giving promise of richer yields in future than ever before. In company with Superintendent L. Glass, J. Roger and Will Herrin, we visited the mine. There is a gigantic project on foot at present to mine out an immense bed of gravel by the drift process. A shaft 130 feet deep has been sunk on the west side of the mine, and a tunnel is being run from the bottom of this shaft under the great mountain on the west where is an inexhaustible deposit of rich gravel. The reason of this resort to drifting is, that it can be mined by that project much cheaper and easier than by washing the great bed of pipe clay and non-paying earth by the hydraulic process. The tunnel is now about 600 feet, and will be run about 1,600 feet further. Mr. Glass is confident of making a big haul when the gravel deposit is reached. Ingersoll drills are being used in excavating the tunnel, and they make about five feet per day. There are 215 men employed by this mine, and their pay roll is simply immense. There are 3,500 inches of water running into this mine through hydraulic pipes, and an average of sixty million gallons passes through its miles of flumes every twenty-four hours. It is without doubt the best regulated and most gigantic hydraulic mine on earth. Louis Glass is general superintendent and John Tuhey is foreman. This mine supports a population of eight or nine hundred. There are in the town four hotels, two well stocked stores, three saloons, livery stables, shoe and blacksmith shops. It is probable that the number of employes in the mine will reach 500 in the fall if the drifting scheme is what the company anticipates. The amount of work done, the money expended, and the general immensity of this mine, is inconceivable unless a person visits and is shown through the mine.

Fresno.

MINING INTERESTS.—Union *Democrat*, June 13: The mining interests of this county are at a standstill at present, but the future is full of promise. The Volcano mine, owned by Thomas Hildreth who formerly lived in Tuolumne, is opened to a depth of 200 feet, and the shaft is still being sunk into a body of very rich ore. The stopes will be started as soon as the shaft is 50 feet deeper. The mine is located in a granite formation. The Abbey, more commonly known as the Morrow mine, has recently changed hands and is now owned by a San Francisco company who have gone to work in a business-like manner. They have a tunnel over 150 feet in on the vein, which averages 18 inches of rock that shows gold. They are sinking a shaft to tap the vein at a depth of 250 feet. Hoisting works are being put up, and in due time a 10-stamp mill will be erected. This has the appearance of being a lively camp this fall. A large store is being put up by San Francisco men, who intend carrying a stock sufficient to supply all the wants of a mining camp. Last Saturday came the final stroke of fate to the short lived Quartz Mountain mine, 12 miles from here. All the miners were ordered to the office for their pay. They were then knocked off, and the works shut down. Hearing of the "burst up," I went over to see what I could see. I will give you a rough description of the scene of extravagance and mismanagement the place presented, a story only too well known to those familiar with the ups and downs of quartz mining in Tuolumne county. The residence of the president of the ill-fated company is the most prominent object about the embryo city. It is a beautiful frame building, handsomely adorned with large bay windows all round, and is furnished in a most luxurious style—Brussels carpets, elegant French walnut furniture, frescoed ceilings, all to the extent of $30,000. To the north of the village stands idle the 60-stamp mill, one of the grandest structures to crush quartz in an extravagant mind ever contrived. It is supplied with modern pans, settlers, splendid steel boilers and costly double cylinder engine—and no gold in the rock. The ditch that was started last summer, and half a million dollars spent on it, has never been completed. Everything lying in idleness tells the old, old story of wasteful and useless expenditure of money before it was known whether there was a mine there or not. Flashy superintendents, fine horses and champagne are true signs of poor financiering in mine management, and Quartz Mountain furnishes a brilliant example of magnificent failure.

Inyo.

WHITE HILL.—Inyo *Independent*, June 13: Two very promising new locations have recently been made south of the White Hill mine. One of these is called the Bald Hill, and was located by Dan Hock, Wells Barnes and Pat Keys. The ledge is two feet wide, and the ore is of excellent quality. Not much work has yet been done on this claim, as the owners are busy with other work. One of the partners working alone has taken out in 10 days seven tons of ore that will net $80 per ton. A region where the labor of one man can produce $560 in 10 days surely offers inducement for prospecting.

WHITE HILL MINE.—From the White Hill mine a large lot of ore is now ready for shipment. This ore will net the owners handsome returns. Here again is another instance of what may be done in the Inyo mountains by practical miners working their own claims. Alexander, Kehoe & Barnes are all working men, they are developing their own property, working as pleases themselves and surely $400 per month is very nice pay for very honest miners, as the worthy owners of the White Hill are. The mine is now looking very well.

WELCH AND DOWNS.—These parties have one of the best claims yet found on the hill; their ledge is five feet wide of nearly solid galena. The mine is in course of being opened up, and improves with each day's work. They are getting out ore right along, and will soon make a shipment.

MINETTA.—Is the name of a claim adjoining Welch and Downs on the south, and is owned by Eldred, Crough and Hedge. The ore is a fine quality of galena, carrying about 65 per cent of lead, and about 70 ounces silver per ton. Very fine specimens of galena crystals are brought into town every few days from the Minetta.

NEW TRAIL.—The owners of the two last named claims have begun work on a new trail, from Union Spring near the foot of Inyo mountains up to their mines. A good trail with but few turns can easily be made.

Mariposa.

TALC VEIN.—Mariposa *Herald*, June 12: The talc vein out at Sherlocks seems to be the center of mining excitement at this time. It is on this lode that the mines of Geo. Lacy and French Pete are located, than which there are none better in this section of country. Several gentlemen from Mariposa have recently located claims, viz: Manuel Davanay, M. M. Rumley, James A. Ridgway, Wilke Green, District-Attorney Jones, Henry Miller and others.

Mono.

SILVER KING MINE.—Inyo *Register*, June 13: This mine, situated in White Peak mining district, Mono county, promises to be one of the valuable and paying mines of the White or Inyo range. It was discovered last February by a Piute, Sam Witherill, also the discoverer of the Indian Queen, and by him shown to its present owner, Hugh Jones, ex-Superintendent of the Queen mine. The vein is four feet in width; average assay value over $100. Mr. Jones is now prospecting the vein by running a tunnel to cut it a depth of 80 feet. An incline on the last fifteen feet shows improvement all the way in the ore. There are several tons of ore on the dump that will mill at least $100.

THE HIGH SIERRAS.—Thos. Agnew, a widely known mining man and old prospector, passed through here from Benton on Tuesday, bound for the scene of his annual summer's labors up here on the extreme head waters of the San Joaquin, in what is known as North Fork district. It is about seven miles west of Mammoth, just over the divide in the comparatively low pass at the head of what is erroneously called the North Fork of the San Joaquin, it being in fact the main stream. Every summer for eight years Mr. Agnew has delved away there, ever firm, as he is to-day, that he has a ledge of sulphide of silver ores really as valuable as any in all this State, or perhaps, any other. As described to us, there are five parallel ledges, all within a mile strip, in a slate formation, traceable for miles, and all yielding rich ores in every place wherever they have been opened, as each has in a number of different places, as at times, seventy or eighty men have put in a summer on them. It is considered an extension of the Mammoth belt, but instead of gold, it is silver ore exclusively. The largest ledge is 200 feet wide, and tunneling into and crosscutting this has been Mr. Agnew's work for several seasons. He has cut into the ledge 30 feet, and affirms that the average value shown by a score or more of assays of pulp from drill holes was not less than $140 per ton. He has about forty tons of ore on this dump,

San Bernardino.

THE BONANZA KING.—Calico *Print* June 14: The mill of the Bonanza King Con. Co. of Providence is being improved and put in good running order and will start up again in a short time. A full force of men will be engaged in the mine as soon as the requisite number of good miners can be obtained. The Bonanza King mine has made a fine record in the past year, yielding on an average of $60,000 per month, and the present indications of the mine warrant the expectation that even a greater yield will be obtained in the future. This company have advertised for thirty-five men more to work in the mine, which will increase their force to about ninety. Under the general management of Mr. Kelley the operations of the mine and mill are being conducted in a most systematic and profitable manner. Other properties in this vicinity, by persistent development, are coming to the front and attracting considerable attention, so that we can confidently expect that Providence will become a large, substantial and flourishing camp in the near future.

MINERS WANTED.—Since May last the work of putting the mill in shape has been pushed ahead as fast as possible. Caldwell's big ore team is running constantly between the mine and mill and the ore house is being filled up. Men are arriving to work at the mill and as soon as everything is in place it will start up again. The ore bodies in the mine justifies a person to predict that the mill will not shut down again for at least eighteen months. The quality of ore at the lowest depth (8th level) shows to be as good as it was in the upper levels. Good miners are being put on as fast as they arrive and the Genl' Manager told me to-day that they want 30 or 40 miners at once. Kerr & Patton are taking out ore for shipping. Dwyer & Gorman are also assorting up ore as fast as they take it out for the purpose of sending to the mill. Cook & Thompson of the Mozart group have about 100 tons of ore ready for milling. The mines of the camp never looked better and the Bonanza King's showing on the lowest levels gives every guarantee of permanency. McFarlane & Barrett are to start the Ivanpah mill on their Mescal mine on or about the 10th.

Shasta.

MILL.—Shasta county *Democrat*, June 13: Ed. Reid returned last Sunday evening from his trip. He purchased his quartz mill and other machinery at the Marysville foundry. The mill apparatus will be shipped and erected at the mine as soon as possible. Low & More, prospectors, last week made another rich strike on Squaw creek within a few hundred yards of the Whitton & Small mine. Assays of the rock made by Ellis of the Windy Camp silver mines run as high as $500 per ton. A few days ago Ebersol, Luce & Co., struck very high grade ore on the second extension north of the Mammoth mine near Churntown, Buckeye district. It is claimed that specimens of the rock excel anything yet found in a fissure vein in that district. Thos. Derby, who bonded Whitton & Small's mine on Squaw creek, accompanied by S. B. Christy, of the State University, passed up on last Saturday's train to the mines.

RICH.—Heretofore we have made mention of the discovery of rich gold quartz by Peter Schearer and Geo. Rattler, on Salt creek, on the former's patented land. When the strike was first made it created considerable excitement in town. They sunk a shaft about 18 feet deep, took out considerable gold, and then ceased work for awhile. About a week ago work was commenced again. Last Wednesday the pay increased, they taking out on that day $200 in one pan. Since, the pay has been getting better, and Mr. Schearer, who is no miner, informed us that he has taken out chunks of solid gold as big as a man's hand, one piece weighing over $500. Since Wednesday last we are informed they have panned out over $2000, besides taking out rock that is more or less yellow with gold. Probably it is the richest quartz gold deposit ever discovered in this part of the State. Mr. Schearer says $100,000 will not buy the property. Several old miners have visited it during the past few days and say it is the richest thing they ever seen in all their mining experience. Small nuggets of gold can be cut from the rock with a chisel or knife. At the bottom of the shaft one can see the "yellow truck" sticking to the rock in strings and blotches. This nice "nest egg" is only three miles from Redding.

Sierra.

PIKE CITY MINES.—North San Juan *Times*, June 13: Judge Bishop, of North Bloomfield, a practical geologist who has made quartz mining a study, has been spending some time at Pike City and vicinity prospecting. He has discovered several new ledges, one of which he calls the Crescent. This ledge crosses Plum valley creek or ravine, and is within three-quarters of a mile of the old Plum valley house. This ledge he traced for a distance of half a mile or more. At the point he struck it the ledge is about eight feet in width and nearly solid. The quartz at this point contains large quantities of galena and dark pyrites of iron. It is rich in sulphurets and free gold can be seen in the rock. The walls are talcose slate. The foot-walls and hanging walls are in tale. It dips into the divide or ridge between the Yuba river and Plum valley creek, and can be worked to immense advantage with water power for eight months in the year. Judge Bishop also took a survey of the Philips & Weiss claim at the head of Grizzly canyon, about two miles east of Pike City. He found the quartz in this ledge very rich with gold. The owners have gone into the bowels of the earth 1,500 feet, and how much farther the vein extends is a case of *quien sabe*. The mine is worked by the drifting process, and not more than 25 per cent of the gold is saved. The adjoining claim on the east, owned by Martin Bope, is in the same kind of formation. A half mile west of Philips & Weiss' claim, toward Pike City, the Judge surveyed a quartz mine owned by Thomas Marriott, which he found, as he believes, a first-class vein nearly three feet wide, and containing rich deposits of gold in sulphurets and oxidized iron and galena. He thinks the latter may prove to be a first-class mine. About a fourth of a mile from the latter mine toward Pike City he examined a mine owned by T. Wayman and Mr. Granger, secretary of the Alaska Company. On this ledge a shaft 20 feet deep has been sunk, at which point the mine is four feet in width and gives evidence of being very rich. A fourth of a mile from the latter location is the Grizzly mine owned by a man in New Jersey named Jameson. The mine has been partially developed and found to be rich in auriferous gold. Still closer to the Alaska mine is the Golden Nugget claim, located by John Greenbank. No work of importance has been done on this claim. So far as prospected it shows a two-foot ledge. The ledge will be included in Judge Bishop's lines when the company is formed. Each location is 1,500 feet in length and 600 feet wide. Judge Bishop says the Alaska mine is immensely rich in gold deposits, and it may be called a true fissure vein. It is now worked on a 500-foot level, and improves in richness as depth increases. Thomas Philips has a location on the eastern extension of the Alaska, but it is undeveloped. W. Philips & Co. have also a location east of Thos. Philips, on the same vein. This location is also undeveloped.

THE FLORENCE QUARTZ MINE.—Sierra *Tribune*, June 10: The above mine is situated in "Nigger" canyon, not far from the famous Keystone mine. A new water-wheel has been placed in position at the mill and the stamps will begin crushing next week. A large body of gold bearing quartz is in sight, and it can be mined and milled so cheaply that low grade ore will pay the owners a fair dividend.

Trinity.

NEW RIVER.—Cor. Shasta *Courier*, June 13: Reaching New River we find the place quiet, and on looking around, find that the reason for this is not to be found in the want of paying ledges, but rather in the want of money on the part of those who have made locations. About 600 locations have been made, and out of that number only some half dozen have been developed, consequently there is no work for the many miners who have flocked in there, and many of whom on this account are ready to run the camp down. There is another class also, who are very expert in speaking a bad word for the place; those are men who never earned an honest dollar in their lives, who rush to every new excitement, to prey upon the hard earnings of the miner. So far as New River is concerned, every vein that has been discovered and properly developed, has proved a paying mine. Among the paying and well-defined ledges in the district are the Mary Blaine mine, which works 16 men and has a five stamp mill running night and day. The Uncle Sam which has also a five stamp mill and an arastra attachment. The Hunter mine, also the Ridgeway, are two well developed and paying properties, and the Uncle Sam mill is now running on Ridgeway ore. The Hard Tack is probably one of the best mines in the district, and has an arastra which yields a return of from $6,000 to $9,000 per month with the work of eight men employed in the mine and arastra. The owners, Messrs. Ladd & Clemens, gave a bond on the mine some time ago to parties in San Francisco for $60,000 and the bond will be closed sometime this month, as the mine is far more valuable now than when bonded. If parties who only seem ambitious to vie with each other only in making locations would turn their attention to the development of some of them instead of simply scratching on the surface, New River would to-day present a far different appearance. But just as long as a few men are allowed to locate the whole country, in order to sell out a few holes in the ground, just so long will the district be held back in development. However, taking the country in between Virgin creek, on the Humboldt side of New River, and coming through the mountains to Shasta, the experienced miner cannot help but proclaim that mining is but in its infancy, when he beholds the numerous quartz ledges that cut the country in a northeast and southwest direction, and when the same energy is displayed in working ledges, that has been displayed in placer diggings, enough wealth will be taken from the immense ledges to again astonish the world with the extraordinary production of the precious metal found in Old California.

DEADWOOD.—Cor. Trinity *Journal*, June 13: I will say that the mines in operation are doing well and yielding bullion as favorable as ever. Those mines bonded by Shattuck and Wm. T. St. Auburn are standing the test very well. Mr. Thos. Simons, superintendent of the Shattuck mines gives very favorable reports and feels confident of opening a large and valuable property. Wm. T. St. Auburn is doing active work, running two shafts and extracting good bodies of paying ore. The Blakemore mine, on Jennings gulch, is also in active operation, and we are in hopes of soon hearing favorable reports from that section. As regards recent discoveries there has been a few during the past week, one by Banks & Clements, on Thorn gulch, which is about two feet between walls and prospects fair; O. J. Collopy is a partner in the new discovery. Another prospect has been struck lower down on the main creek which looks very promising. Other prospects have been found, but little or no information can be obtained as regards their richness and size.

Ventura.

ANTIMONY.—Ventura *Free Press*, June 10: "The antimony mines, situated about 60 miles from Ventura, in Ventura county, are being worked at the present time with considerable success. They are on the north slope of the San Emigdio mountain, five miles from the summit. Our informant who has just visited the spot, says a mill is in the course of construction and will soon be in working order. The mill is located in San Emigdio canyon and about two miles from the mines. The trail is steep and zigzag, but when reached there seems to be a mountain of ore represented by short tunnels at different levels and showing ore everywhere. In some parts of the mine the ore assays 150 ounces of silver per tonr About this mine hangs a mystery that nothing but the future can reveal. It has been rumored for many years that somewhere in the San Emigdio mountains is an old mine worked by the Mission fathers, but its whereabouts has been so completely concealed that it has never been rediscovered. A Santa Barbara gentleman told our informant that a relative of his as far back as 1854 went into the mountains with a party of men, accompanied by an old Indian who was to take them to the lost mine, which was reported to be very rich, but after many adventures the search proved a failure. It is not unlikely that this antimony mine was worked by the early fathers." This mine is now owned and is being worked by a company of which Chaffey Brothers of Ontario are the leading spirits. Geo. Chaffey is superintending the mill property and getting it ready for work. The company we learn has a contract at a good paying figure for all the antimony they can take out to be shipped to England.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, June 13: The flow of water which came in from the east side of the main north lateral drift on the 3,000 level Wednesday night still continues. It is near the face of the drift, 150 feet from the Savage north line, and opposite cross-cut No. 4. This portion of the drift has been comparatively dry heretofore, but the formation on the east side being of the clay and porphyry order, and becoming saturated with water from the recent pump flooding as well as from the water following the strata from the level above, it gradually swelled and pressed inward. The flow of water is between two and three inches, but as it comes from the 2,900 level, from whence it has flowed heretofore, there is no real increase of water for the pumps to handle, and no trouble whatever is experienced from that source. Meanwhile the timbering has had to be braced and thoroughly secured, and it is not deemed advisable to advance the explorations any further in that direction at present. In fact this north lateral drift has been found too far to the east of the ore vein—about 45 ft.—and was recently turned more to the westward in order to skirt diagonally into the ore vein. The face of cross-cut No. 4 west from it was showing good streaks and spots of fine ore at the time this trouble cut off the work. Archie Borland says it is the intention, however, as soon as practicable, to resume explorations both north and west at the interesting point. Meanwhile, in order to guard against and provide for any additional water emergencies, the management have given orders and contract for an addition or other half to the big hydraulic pump in the Combination shaft. This will double its capacity, and make it able to pump a stream from the lower levels as large as Carson river. It will take a few weeks to get their new pump column in, but when this is done the present one, which bursted and gave so much trouble recently, can be repaired or renewed with the greatest facility, and without interruption to the

regular drainage of the lower levels. From cross-cut No. 2 the lateral drift south is out about 25 feet, in good milling ore, leaving about 80 feet to connect with the drift coming north from cross-cut No. 1. Ore from the openings on the 3,000 level continues to be hoisted as occasion offers, and quite a large accumulation of it is on the dump. The winze to be sunk in the ore body below the 3,000 level will be from the north lateral drift in cross-cut No. 2.

CON. CALIFORNIA AND VIRGINIA.—The regular weekly yield of ore from the 1,750 level, on company account, is about 750 tons. It is all from the old bonanza stopes and workings, and the average assays for the past week were $17.50 per ton. This ore is all shipped to the Morgan mill for reduction. Cross-cut No. 3 on this level is being advanced at the rate of about 25 feet a week. On the 1,700 level the main north lateral drift is being extended in good working ground. From the Jones lease section, the upper bonanza workings, over 1,000 tons a week are being extracted, but the average grade is rather low, the assays during the past week averaging $10 per ton. This ore is shipped to the Eureka mill, on Carson river, for reduction.

BALTIMORE CON.—Only enough ore was raised for a test of the new furnace last week. It succeeded very well, but better success is expected from the next run, which will be made shortly. The tributers working on the 226 and 450 levels are still extracting and accumulating high grade ore from the small narrow vein.

CHOLLAR.—Good progress continues to be made advancing the main lateral drift southward on the 3,000 level, and cross-cut No. 3 shows good vein formation in its face with occasional spots of ore-bearing quartz.

MEXICAN.—On the 500 level the joint Mexican and Union drift, running north, is being steadily advanced, and a drain is being cut to carry off the surplus water. The west cross-cut is also making good progress.

BEST AND BELCHER.—The joint east drift with the Gould and Curry, on the 1,000 level, is being advanced at the rate of about 60 feet a week, in good working ground. It is now out about 200 feet from the main lateral drift.

OPHIR.—The upraise above the 500 level, to connect with and drain the old Mexican shaft, is making about 15 feet a week of upward progress, the work necessarily being slow and carefully conducted.

BULLION.—Water interferes with the work on the 160 level, but the west drift makes continued advancement, and has passed into very favorable looking vein porphyry and quartz.

CROWN POINT.—The old upper levels of this mine, and also the Belcher and Kentuck, continue yielding large amounts of low grade ore, being the leavings of former bonanza days.

ALTA.—The upraise above the 950 level is being continued, and good little bunches of ore are found in the explorations, which are taken out for milling.

OVERMAN.—About 25 or 30 tons a day are being extracted from the 226 level and the incline below, which is shipped to the Vivian mill.

YELLOW JACKET.—The old stopes and chambers from the 1,200 level up are still yielding and holding out well as usual.

WOODVILLE.—About 10 tons a day of good pay ore are being extracted from the 400 level.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, June 13: The west drift on the sixth level has advanced 20 feet during the week, and the east drift on this level has been driven 10 feet. The east drift on the fifth level is in 145 feet and shows ledge matter giving low assays. The stope above the west drift on the fifth level is giving some good ore and looks promising. The intermediate stope, between the fourth and fifth levels, looks well. The west drift on the fourth level is giving some $30 ore from a small streak. The west drift on the third level is turning out considerable ore of good grade. Some ore of fair grade is being stoped from winze No. 5, below the third level, and also from the intermediate, between the second and third levels, east of the shaft. The second level is yielding some high grade ore, from a small streak. The intermediates, between the first and second levels, show an improvement and are giving some high grade ore. The west drift on the first level is yielding a little low grade ore, and the east drift on the same level is giving some high grade ore from a narrow streak. A bullion shipment of $14,884.40 was made on the 8th instant.

Eureka District.

PROSPECT MOUNTAIN.—Eureka *Sentinel*, June 10: The Alexandria and El Dorado mines below it on the hill are being worked on tribute. A shipment of nearly fifty tons was made from the former last week, and at the latter there is a good pile of ore on the dump, ready to be shipped to the furnaces. I next went to the Lord Byron mine, which has paid so well lately after a rest of twelve years. Seeing no ore on top, I moved on to the Morris and Whippoorwill mines, the property of Joe Dejoe. Here the country looks hard and hungry enough on top, but the dump is covered with ore. The country around here has been sounding the praise of Joe's mine on account of the discovery of a system of caves, which contain no end of ore. Joe had gone to town to spend the Sunday; hence, I had to forego the pleasure of seeing this new wonder. A little higher up the mountain and to the northward is a tunnel and dump, but there being no one around I could not learn the name of it. However, I saw the best evidences of a prospector's prosperity, viz: Two hundred sacks of ore, and from 2 to 15 tons ready to be sacked. This appeared to be of very good quality. In this locality there is a remarkable growth of fine timber, consisting of oak and pine, which puts it in a pleasant contrast with the bare and barren hills surrounding it. I made a hasty call on Martin Piantoni at the Dead Broke mine. He is taking out some splendid carbonate of lead ore, of which there is a very large quantity in sight. Martin says there was a party looking after a lease of the Lizzie L. mine, and thinks they can make money if they get it. The Williams mine is looking well, and John McNaughton is commencing to ship about 100 tons of ore from there to the Richmond furnaces. The ore from this mine is usually of good quality. This much is plain to an observer: There is a strong evidence of growing and increasing prosperity on Prospect Mountain, which is apparently due to the number of miners who are leasing claims. In some cases 20 per cent is paid to the owners, but in most instances the owners provide supplies and receive a higher percentage of the ore.

ORE PRODUCERS.—Eureka *Sentinel*, June 13: The ore shipments from mines in various parts of the district to the two reduction works in town during the past week have been numerous and in some cases unusually large. The Jackson mine on Prospect mountain sent down to the Eureka Con. works 18½ tons of ore, and the Hamburg, a neighboring property which is looking very well, shipped to the Richmond works 12 tons. The Bowman mine on Adams Hill shipped to the last named furnaces 25 tons, and the Idaho on the north spur of the same hill made a shipment of 10 tons. The Frazier & Molino shipped 9 tons to the Eureka Con. furnace, and the Ohio made a fair size shipment. To the Richmond works the Lord Byron shipped 12 tons, the Dunderberg 17 and the Eldorado 6. The Marguerita shipped to the Eureka Con. furnace 5 tons, and the Eureka Star sent down to the Richmond works quite a lot of good ore. Shipments were also made to the last named works by the Queen mine, the Uncle Sam and the Maryland. Tom Kinney shipped in to the Eureka Con. works from one of his properties near Hamilton 4½ tons, and from the Reveille district, Nye county, over 80 tons of rich ore was sent in. The Silver Connor mine, on Prospect mountain continues to look splendidly, and the ore yield from it during the coming summer months will fully equal if not excel those of last summer. It paid to its owners last month a dividend of $1,000. The Silver Lick, on Adams Hill, is also looking and yielding well, and the probabilities are its owners will soon know what it is to receive good sized dividends.

ARIZONA.

CLIFTON.—*Clarion*, June 10: Messrs. McCrellis and Johnson, who contracted to get out ore on the "7-30" a short while back, were compelled to give it up on account of the flow of water running in. The Copper King, which is in the Metcalf group, is worked by contract by Messrs. Murphy and Mike Shea. They are getting out about eighteen tons of copper ore daily, and have six men in their employ. The machinery at the head of the Longfellow incline has been undergoing repairs. The incline tunnel is in 80 feet. It is going to be drove down to the 500-foot level, and a skip is to be run in it when completed. Parker and Whalen's outfit are at the Garfield. Prospectors have left the mountains, and developments of claims have stopped since the outbreak. Thus things will remain until a sense of security is felt, or, at least, a more settled state of affairs. Work on the Alaska, El Paso, Tip-Top, Vanderbilt, Commercial, Morning Star and Ady Blum has been suspended, the boys deeming it not prudent to undertake to work and watch at the same time for Indians. This step was taken on receipt of a copy of Gen. Crook's cautionary telegram.

COLORADO.

VARIOUS DISTRICTS.—Colorado *Miner*, June 13: During a business trip last week we passed through the following mining districts: Banner, Trail Run, Downieville, Montana and the northern end of Griffith, and is gratifying to report the prosperous outlook in all the camps we visited, with the exception of Banner district, which seems in a dormant state at present, but the prospect of a revival of work on an extensive scale is promised. Trail Run is fast coming to the front. The smelter there is running day and night, and is unable to keep up with the demands made upon it. Downieville and Montana districts are shipping large quantities of ore monthly, all of a high grade. The lodes surrounding Dumont are looking better than ever. The citizens of that camp are in high glee over their brilliant prospects. But Griffith district still leads the van. The amount of ore produced in all these districts, if it was possible to report it, would astonish the outside world. Never in the history of this county has the output been so large as at present. The Johnson lode, in Argentine district, is still producing her usual quota. Comstock & Co., contractors on No. 4 level, have exposed a vein of sulphuret ore from two to six inches thick. A good shipment will be made in about ten days. Johnson and Peterson, lessees on No. 5 level, have a vein of the same kind of ore, ranging from 2 to 8 inches in thickness. They will also make a good shipment shortly. The Morgan lode, in Trail Run district, is owned by Morgan, Brooks and Williams, who have sunk a shaft upon their claim to a depth of 30 feet, which shows a vein of auriferous quartz 3 feet in thickness, which mills 13 ounces gold and 157 ounces silver to the ton for first-class, and $98 for second-class. The Gypsey is the west extension, and is owned by the same parties, who have merely made a discovery upon the claim, which looks very promising. Keith & Co., owners of the Keith tunnel and group of lodes on Keith mountain, on Mill Creek, contemplate putting in an Ingersol drill, to be run by water-power, and bids for a contract to build a flume are now being taken. We would like to see this tunnel driven ahead, as from our knowledge of the country, we feel perfectly confident that it would open up some valuable claims. The Pelican-Dives mine, on Republican mountain, produced and shipped 46 tons of ore last month, the largest monthly shipment since 1883. Fifty-eight men are now employed on this claim. The output is increasing every month, and before long we hope to see this old property once more in the lead. The Old Bluff lode is a new discovery by McDonald and Reed, in Trail Run. They had a test made of some of the surface quartz which gave $18.90 gold to the ton. With depth this claim will undoubtedly prove a good producer. The discovery now shows a vein of quartz 12 inches in thickness. The Old Settler lode, in Trail Run district, will be worked again soon. An engine is to be erected at the shaft in place of the whim which has been in use. This is unquestionably one of the finest pieces of gold property in the State, and the present owners are to be congratulated upon their apparent bonanzas. The new pump has arrived, and is now in working order at the Albro mine at Dumont. The old Albro is one of the main veins of this county, and now that everything has been arranged, the work at sinking on the shaft will, in all probability, be commenced within a few days.

IDAHO.

THE SMOKY DISTRICTS.—Wood River *Times*, June 10: W. H. Watt returned to-day from a trip to the Smoky districts. He reports a large number of prospects there looking very promising, while the mines are looking better than ever. The Carrie Leonard makes a really fine showing. The vein is eight to twelve inches wide, of high grade ore carrying gray copper. All the openings show ore. The owners are preparing to ship to Ketchum, owing to the absence of a wagon-road to Hailey; but to do this they will be compelled to pack 15 miles to the wagon-road on Warm Springs Creek. McElhaney's King of the West is looking well, and also preparing to ship—to Hailey, if the road is completed; or Ketchum, if there be no other road. McCarter's mine looks well, the tunnel having tapped the ledge at a depth of 150 feet. On Pierce Dorgan's Galore six or eight men are employed, night and day. There are 60 sacks of rich ore on the dump, ready to ship, and a good quantity in sight. Geo. H. Merrill's prospect, below the Galore, shows a small vein of chloride, carbonate and galena carrying native silver. The miners there are also sacking ore. There are 25 Chinamen hydraulicking in Newton River's placer claims—to which point the road will be completed in a couple of days; but it will have to stop there unless the people of Hailey pay up their subscriptions and enable the contractor to keep working. The road is now completed to a point five miles from the Carrie Leonard Creek,

THE IDAHOAN MINE.—It is stated that in a few days the Idahoan management will declare a dividend of $4,000, payable immediately, and that this will probably be followed by monthly dividends for at least equal amounts all through the summer and fall. The above will be most welcome news to this community, as the Idahoan, like the Parker, is owned entirely by parties residing here.

WOOD RIVER OUTLOOK.—*Times*, June 10: Slowly, gradually, the clouds which have hung over the financial sky of Wood River for months, are disappearing before the steady improvement reported from all the ore-yielding regions tributary to us. Lava Creek shows at least three first class prospects besides the noted Horn Silver, and has already commenced shipping ore here. The Smoky districts are only awaiting the opening of the new wagon-road to turn the ore-stream this way. Rock and Camp creeks—the gold-bearing belt—are beginning to show some activity, and bullion will soon be rolling in from there. The base-metal mines on the near slope of the Rock creek water shed are already shipping, and will soon double their output. Deer Creek will, this year, do better than ever, as there will be three producing claims for every one heretofore. The East Fork of Wood River will likewise yield more largely. The Hailey Concentrating Works are running to their full capacity, with ore enough in control to run all summer. Colorado and Star gulches have already commenced to yield up their winter's accumulations; while Croy gulch shows at least one bonanza—the Climax—besides three other good claims. Then, the low grade ore proposition is also "looking well;" Mr. Havens has over 4,000 tons of that class of ore promised him. If he only gets one-fourth of that amount it will be so much redeemed from the waste dumps and hitherto unproductive claims. Bullion is the only camp which does not hold out very flattering promises. Yet even that vicinity does not look so very discouraging, after all. The Idahoan is about to declare a dividend; the Cyclops—on the Divide—is showing up a bonanza; and the Bullion-Ophir tunnel will be in the ore chimney in two or three weeks. The upper country is about to have a concentrating works—the Silver King—and much ore can doubtless be marketed now which was beyond reach before. Near Bellevue, the Minnie Moore shows steady improvement, and is only awaiting Superintendent Palmer's return from England to resume shipments; while the Queen of the Hills Company will doubtless remain a dividend-payer this year, at least. Below Bellevue, Resurrection District is showing much good ore and promising to show a mill soon, if Hon. John Hailey ever gets back from Washington. Taken as a whole, the local mining outlook is quite favorable—as much so as it has ever been.

THE OPHIR MINE.—Ketchum *Keystone*, June 10: The mining outlook up on Boulder Creek is brightening every day. The Ophir is the leading attraction at that point just now. This property has been worked for the past two seasons, but mostly in the way of tunneling and opening the mine. The main tunnel is in 100 feet and has been run through pay rock from the face of the hill. Fifty feet in a shaft has been sunk to a depth of thirty feet and is on a two-foot vein of galena and carbonate ore. At the end of the tunnel a shaft has been sunk to a depth of seventy-five feet, which has been cut through ore of sufficient value to pay the expense of sinking the shaft. From the bottom of this shaft a tunnel has been run toward the face of the hill, directly under the main tunnel, for a distance of thirteen feet and is in a two-foot vein of galena and carbonate ore. The assays show 150 ounces in silver, one ounce in gold and a considerable quantity of lead to the ton. The contract for packing the ore a distance of six miles to an accessible wagon-road was to have been let last evening, and the delivery of ore at the Philadelphia Smelters to be commenced about the 10th instant. The product of this mine in 1883 was only about sixty tons, in 1884 275 tons, but this season no estimate can be placed upon the probable output—all the way from 500 to 1,000 tons, and possibly more. The lucky owners of this valuable mining property are G. L. and H. J. Murdock, J. H. Beatty, T. F. Shaw and C. W. Weaver. They all feel much elated over the prospects of their mine, and well they may.

MONTANA.

RICH MINES.—Helena *Independent*, June 6: Messrs. Ryan, Cannon and Holter, who have been out to Belmont, returned on Thursday evening, and were yesterday sought by a reporter of the *Independent*, who gathered from them many interesting facts concerning what they saw. They went out to look at the Empire, Homestake and M. L. Lode, owned by Messrs. Ryan, Lane and Lynch, and express themselves as well pleased with the outlook of these mines. The Empire has on the east end of it a tunnel run in over one hundred and fifty feet in depth. At the end of the tunnel cross-cuts have been run, and a very rich body of gold and silver bearing ore has been struck, of a width of about twenty feet from wall to wall, the ore assaying from $80 to $700 per ton in gold, and will run as high as $35 in silver. Four hundred feet west of the tunnel is a shaft of over 50 feet deep, at the bottom of which is run a drift, and then a cross-cut, in which 10 feet of ore has been struck that averages from $80 to $100 per ton in gold and 30 ounces in silver. Eight hundred feet still farther west is a 65-foot shaft in which a 32-foot-drift has been run, with a cross cut at the end, showing a 10-foot body of ore which runs from $100 to $150 per ton. The M. L. has a 100-foot shaft on it, and shows ore on it that runs $80 in gold and $35 in silver. The Homestake has three different openings upon it, each one of which show ore that is immensely rich. Messrs. Cannon and Holter went out to take a look at these mines with a view, that if they showed up anything near what they were represented to, of purchasing. Judging from the glowing terms in which they speak a sale will soon be consummated. The gentlemen also give glowing accounts of other mines in the vicinity and of the Marysville mines. In the Drum Lummon a very rich strike has been made on the lower level of the drift heading north and shows up a vein of ore that is immensely rich.

COPPER MINES.—Butte *Inter-Mountain*, June 13: The Parrot mine is now producing ore at the rate of 8,000 tons per month. The extracted ore reserve is 6,000 tons, which is increasing, despite the active operation of the concentrator and smelter. The mine is in good shape. The 330-foot level has been extended to the east and west end lines, but the stopes expose an abundance of ore, and further sinking will not be resumed until fall.

CLARK'S COLUSA.—The output of Clark's Colusa is now 175 tons daily, chiefly from the 200-foot level. On the 300-foot level no stoping has been done and immense quantities of ore are available for extraction. The walls are 80 feet apart and in one place, between the 100 and 200 foot levels where ore is now being extracted, no sets of timber are required and the pay ore body is 50 feet wide. The mine is now being put in good working shape and that part of the shaft above the 200-foot station will be newly timbered. The concentrator is treating 80 tons of ore daily. The smelter will resume operations in a few days.

GAGNON.—The Gagnon is being worked on the 400, 500 and 600 foot levels and the ore product averages 40 tons daily, which amount is concentrated and worked at the Colorado smelter.

MOUNTAIN VIEW.—C. X. Larabie is opening up immense ore reserves in the lower levels and making regular shipments of crude ore. The property could readily supply a smelter as big as that of the Parrot Company and still its productive resources would not be unduly taxed.

NOTES.—The Montana Company are working the Colusa, West Colusa and Montana Parrot, and are extracting more ore than the smelter can treat. The Clear Grit is sending its copper-silver product to the Colorado smelter. The Bell keeps the smelter well supplied with good ore.

OREGON.

A BONANZA.—*Sentinel*, June 10: Where the big discovery was made on the Yank ledge is the portion formerly owned by Wm. Bybee of this place. Eight men are now employed in running two tunnels with the rock now running all the way from $8 to $400 per ton. When the size of the ledge is taken into consideration—240 feet wide and can be traced for 30 miles—it will take a better mathematician than we are to figure out what all will yield. As was at first generally supposed work has not been suspended on account of Mr. McNevin's death and the digging of the tunnels will be continued right along. Taking in view the dimensions of the ledge, with the new cheap processes lately invented for working quartz, and then estimating the whole at the very lowest assay yet made of the rock, which is $8 per ton, it would cause the making of more millionaires and building up of a town longer lasting and much better than the palmiest days seen by Virginia City, Nevada. Leading capitalists of California have got hold of this mine and ex-Governor Chadwick will take McNevin's place in charge of the work. This discovery will also tend towards the opening out of the numerous quartz ledges in this end of the State and the prospects of Southern Oregon now look brighter than ever.

UTAH.

REVIEW.—Salt Lake *Tribune*, June 12: The shipments from this city for the week ending Saturday, June 6th, inclusive, were 1,622,333 pounds. The receipts of bullion and ore in this city for the week ending June 10th, inclusive, were $72,515.79 in aggregate, of which $63,615.79 was bullion and $8,900 ore. The week previous the receipts were $79,034.78 in bullion and $13,720 in ore, a total of $92,754.78. The shipments of the Ontario for the week were 43 bars of bullion, of the value of $34,556.43, bringing the total product for this year to date up to $730,257.72. All goes well at the mine and mill, and the monthly dividends continue with undeviating regularity. The sandstones yielded $10,359.38 during the week, of which three silver bars, valued at $5,500, were from the Stormont, and three silver bars, $4,859.36, from the Christy. The product from the Hanauer smelter for the week was seven cars of bullion, assaying $13,000.

SANDSTONE MINING NOTES.—Southern Utah *Times*, June 13: The leaching works are kept running to their full capacity, with profit to the proprietors. Charles Miles sold his interest in the Vanderbilt to M. H. Quirk and C. H. Balch last week—Dick Richards still retains his interest. There are now four men at work on the mine. It is the intention of the new company to vigorously prosecute work on this valuable property. In constructing a new road to convey the ore from the Emma mine, last week, a six-inch ledge of high grade ore was uncovered. A sample of the ledge assayed 710 ounces of silver per ton. Fourteen tons of ore taken from the old workings was shipped to the Christy mill this week. The Emma adjoins the Vanderbilt, and is owned by J. B. Smith and Dick Jarmin who feel elated with the present outlook.

Shasta County Districts.

[From our Traveling Representative.]

The work of opening up mining property continues with more or less remunerative results throughout the county, the success of a district oftentimes resulting in the discovery of an adjacent one by the general prospecting now going on. In a number of districts a great deal of quiet work is progressing, of which hut little talk is made. If a continuance of this state of affairs can be maintained, the mining interests of the county will enjoy a standing deserving of encouragement. In case of a failure in some cases the detriment to the merits of the county will not he any more hurtful than the suspension of an honest business man who pays dollar for dollar and starts in again. Heretofore the working of poor mines in the face of positive proof of their worthlessness in the blind hope of "lightning striking" deeper or farther in, has hurt Shasta county. Such doings are going out of favor here, although now and then some crauk with more sand than sense runs in debt and spends other people's money in carrying out a persoual hobby or putting up a mill before having either prospect or mine.

Prosperous Districts.

Old Diggings, seven miles northerly from Redding shows more activity than for years past. The district is situated most advantageously as to hring near water and railroad. The nnmher of mines opening up, and in many cases with excellent indications, is encouraging to both the prospector and district resident, or business men from whom supplies are bought. Manufacturers of mining and milling machiuery have been benefited by the renewal of work in this camp, as a number of mills, concentrators and considerable mining machinery has been shipped to the camp.

The quartz vein matter lies between sla'e and porphyry, the ledges varying in width from stringers to twelve feet wide. As yet the camp hoasts of nothing but good prospects, as but little depth or length has been made on the contacts. There are a number of small mills in the district, and as usual with prospering camps lots of talk ahout many mills soon to go up. A lack of moneyed men places the camp on the "after awhile" list, as loss of muscle and not much money takes time to bring out mines that need means as well as work.

Old Diggings Concentrates.

Very rich—Old Diggings sulphurets.

The Sacramento river is one mile distant.

Dale and Hiatt are opening a good prospect near the Mammoth.

Steam power is necessary to run mills and deep mines of this camp.

Two arastras are running on high grade ore on the Fleming property with filthy lucre results.

The fare from San Francisco to Redding is $9.10 via the Oregon division of the C. P.; time 10 hours.

Dan O'Neil has a cannon-ball mill on his prospect; as yet, however, he has no concentrators to save his sulphurets.

Reid & Coe have a ledge from two and a half to four feet wide and are down 100 feet. They have some 400 tons of ore on the dump that is said to rnn from $10 to $40 per ton. They are negotiating for a mill.

The Mammoth mine has opened up a ledge from 4 to 12 feet wide that runs from $12 to $25 per ton, and carries hut little sulphurets. This is an old mine and has a great deal of development work done on it.

The Central, owned hy Judge Aaron Bell and others of Shasta, is looming up in good shape. A depth of 120 feet has been reached showing a ledge from 2 to 10 feet that assays $22 and $25 per ton. The percentage of sulphurets is large and runs high in gold. Recent assays of sulphurets run $28,000. A 5-stamp mill with Duncan concentrators will probahly he placed on the mine in a short time.

Shasta.

For some years past Shasta, the county seat, has been "about the same." It isn't every camp that can hang out ahout the same right along. Mining in the immediate district is quiet, cxtremely so. Newcomers who throug the county looking for mines they read about, and the activity in recording claims at the Clerk's office, has stirred up many "old time rocks" to get out and rustle. The consequence has heen fruitful to the landlord, storekeeper, freighter and last hut not least to the saloon keeper. As the country away from Lome is taken up and prospected, that near Shasta will he worked as a last resort and probahly pay better than the other. Business men and professionals are gruh-staking reliable prospectors, and already there dawns bright visions for the future of both Shasta and her hospitable people.

Shasta Notes.

Shasta has a fine hotel.

Miuing in the vicinity of Whisky town is at a standstill.

The fare from Redding or Middle Creek to Shasta is $1.

The town is headquarters for mine owners and the legal lights of the county.

"Old times come again," said the oldest inhahitant, as he pointed to a jack train starting out with supplies to a miniug district.

Thero is talk of the Mad Ox, an excellent property near Whisky town, starting up soon. This mine has paid hig money in the past.

The Shasta *Courier* resemhles the county in many respects. For some time past husiness did not justify much push or enterprise; now that things are looking better, Bro. Carter is bracing up and keeping ahreast with the times.

Among others gambling with Dame Fortunc in mining is Col. Ed. Sweeney, Shasta's learned and popular District Attorney. Blackstone, geologically speaking, appears to pay hetter than "assaying" the contents of the law authority mentioned. In Eagle Creek district, four miles from Shasta, is situated the Sweeney honanza. Ore that paid $50 per ton has been shipped to Denver from this property. A good force of men are at work, and 80 feet in depth shows a good two-foot vein. St. Auhurn, a mining man of Deadwood, is interested with the Colonel in this prospect.

The "Lost Confidence," a misnamed group in the Iron Mountain district, adjoining the Flat Creek district, is attracting considerable attention by the excellent showing and fine results from shipments made. Messrs. Canden and Magee and others, of Shasta, are the owners. The ores are argentiferous, the formations being almost a *fac simile* of those of the Windy Camp group, fully described in the PRESS of June 6th. The extent of the ore body is almost incredible. The owners are very reticent as to their future intentions; also, as to the grade of their ores. Regular shipments from this honauza have been made to Hill's Argo smelter, near Denver. The freight from Redding to Denver heing $19 per ton, and $15 per ton for treatment. The Denver people paying from 90 to 93 per cent on the assay value. On 500 oz. ore they pay as high as 95 per cent net. The Lost Confidence is workiug a good force of men, and if a sale is not effected soon, extensive machinery will be put up on the property. At present the group is held at a high figure. This property is the most promising in this vicinity.

Miscellaneous.

Comparatively speaking, but little prospecting is going on ahout Ono.

The Merchants' Bank of San Francisco is largely interested in mines ahout Igo.

Mining ahout Igo, owing to a scarcity of water and a monopoly owning the largest portion of prospecting ground and the entire water supply of the district, is not enjoying the prosperity that it would otherwise.

The putting up of a Huntington mill on the north fork of Cottouwood, hefore having sufficient ore in sight to even justify expenses, is a lesson that should not be lost sight of by the people in the vicinity of Ono.

Considerable attention has heen paid of late to the Spencer mine eight miles northwest from Ono. This mine is an unusually promising one, and if handled by capital instead of "pottering along," as it is uow doing, the results would be different. Notwithstanding the chances capital would be taking in opening up the property, it could not he had at anything like its actual value. The mine is situated most advantageous as to the easy development of its ore hody. An admirahle mill site, water power aud plenty of timber give the property advantages enjoyed hy hut few prospects. As far as development has progressed the indications are favorahle to the opening up of a fine mine. The ledge is a blind one tapped about 100 feet deep by a 200-foot tunnel from the side-hill. The ore body is a quartz, the center of which appears firm, while on either side next to the walls the quartz is of a decomposed crumhly nature mixed here and there with a yellow sedimentary matter that runs well in gold. The vein matter on the level tapped is nearly 14 feet in width. A shaft down 90 feet from this level shows firm walls, hut a pinching out of the more solid quartz and the existence of a soft conglomerate sedimentary matter with streaky deposits of partially decomposed quartz, the matter milling probahly $12 per ton. One hundred feet more depth will probably either open up or shut down the mine as a desirable property. F. W. S.

Mining Share Market.

The attention of stock dealers is still directed to Hale and Norcross, and the fact that considerable water has been coming in has brought the stock down a peg or two.

It must be borne in mind that this striking of water in the ore sections has always been considered as most favorable for the development of an ore body, for ore bodies in the Comstock do not exist without water, and sometimes large and troublesome quantities of it.

Understanding well the situation, and having fortunes at stake, in reaching ont explorations after ore the drill is always kept feeling ahead, and every precaution taken to guard against any possible disaster from water or anything else. The water is draining out of the lower level. Several tons of good pay ore have been hoisted and sent to mill.

The north lateral drift from cross-cut No. 1, and the south lateral to meet it, from cross-cut No. 2, are both showing well in very good pay ore, and the winze being commenced from the floor of the 3,000 level in cross-cut No. 2, to sink deeper below that point in the most eligible and promising part of the ore vein, is showing richer ore than yet found anywhere at that depth. Some spots and streaks of it are very high grade, giving promise of ripening into a bonanza as further depth is attained.

The *Enterprise* says that vague rumors continue to be prevalent of concealed ore bodies in the north end mines, especially about the big bonanza section; also, of undeveloped ore bodies quiescent in certain mines not being worked; also, of proposed charges in control and management, which are to raise those stocks in a lively and refreshingly upward manner; but all these reports prove thus far to be decidedly of the mythical and unreliable character. The old bonanza sections of the north and south ends simply continue their very gratifying and prosperous yield of low grade ore, and some other mines of smaller magnitude and reputation give a daily contribution of bullion material.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco:

PINE TREE M. Co., May 19.—Capital Stock, $10,000,000, Directors—Thos. R. Hayes, A. H. Griswold, Daniel E. Hayes, N. C. Wilson and A. G. Booth.

AERIAL STEAM NAVIGATION CO., May 18.—Capital Stock, $100,000. Directors—Wm. Patterson, A. Craig, J. G. Severance and Howard Livingston.

THE Ingersoll Rock Drill Co., of New York, have carried off the highest honors at the New Orleans World's Fair, where their handsome exhibit of rock drills, air compressors and other mining machinery attracted general attention. The judges have awarded them three first prizes, namely, a gold medal for the best rock drill, another for the best air compressor, and still another for the best display. In making these awards the judges, who had the best opportunity of appreciating the qualitiee of the different makes of machines placed in competition at the fair, have but confirmed the popular verdict and voiced the general opinion regarding the merits of the machines manufactured by the Ingersoll Co. The agents on thie coast are Messrs. Parke & Lacy.

THE State Salmon Hatchery at Redding will be finished this month.

Bullion Shipments.

Hanauer, June 9, $3,900; Queen of the Hills, 9, $1,400; Ontario, 10, $34,566; Hanauer, 12, $2,300; Queen of the Hills, 12, $1,200; Hanauer, 13, $4,700; Stormont, 14, $3,080; Queen of the Hills, 14, $1,100; Hanauer, 14, $2,600. The Banks of Salt Lake City report the receipt for the week ending June 10th, inclusive, of $63,615.79 in bullion, and $8,900 in ore, a total of $72,515.79.

Gold Mines For Sale.

Two small gold mines for sale, in Kern county, California. Ore has paid by arastra $20 per ton. Worked to a depth of 60 feet. The vein is 15 inches wide. The mines are within seven miles of the Southern Pacific Railroad. The owner is not in a position to develop them without aid. The purchase price is very reasonable and there is a good opening for any one to take hold of the claims and work them. Address W. L., P. O. Box 2361, San Francisco.

PRICES reduced on all compound lenses required to be duplicated. C. Muller, optician, 135 Montgomery street, near Bush, opposite Occidental Hotel.

The Bartholdi Statue.

The steamship Isere arrived this week in New York with the famous Bartholdi statue of "Liberty Enlightening the World," which has been

presented to the United States. The weight of this stupendous statue is 440,000 pounds, of which 176,000 pounds are copper, and the remainder wrought-iron. It will he erected on Bedloe's Island, this heing the location selected for it hy Gen. Wm. T. Shermao, who was appointed hy the President to make the selection. When placed in position it will loom up 305 feet ahove tide-water, the hight of the statue heing 151.2 feet, that of the pedestal 91 feet, and foundation 52.10 feet.

The committee iu charge of the erection of the pedestal for the reception of this great work have prepared a heautiful statuette, as a souvenir to send to each person who subscribes $1.00. The proprietors of the paper have secured from Richard Butler, secretary, New York, a limited number of these statuettes, and will send one prepaid by mail or express to any subscriber of this paper or the persou who will scnd us $5 worth of new subscribers while this notice remaios in this paper. Donations can he made direct to the fund by scnding the amount to this office, the receipt of which will he published in our columns and the amount duly forwarded to the commissioners in New York.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JUNE 9, 1885.

319,776.—ARTIFICIAL FINGER—I. Bashore, Walla Walla, W. T.

319,549.—TREATING POMACE FOR KEEPING THE EXTRACT CLEAR—A. Blaker, Shedd, Or.

319,559.—BOILER TUBE EXPANDER—M. Cashin, S. F.

319,679.—AXLE LUBRICATOR—J. M. Denny, Wartsburg, W. T.

319,468.—SPITTOON—Dorsey & McQuarrie, Walla Walla, W. T.

319,572.—BOLTING REEL—Francis Ferrier, Vallejo, Cal.

319,816.—METAL CUTTING TOOL—G. Hoefer, Champoeg, Or.

319,586.—SEED SOWER—G. E. Kaltmeyer, San Buenaventura, Cal.

319,911.—LUMBER MEASURER—E. Y. Knapp, Arcata, Cal.

319,912.—ELECTRIC ENGINE—W. A. J. Kohrn, S. F.

319,610.—ORE AND SALT DRIER—A. A. Nevin, S. F.

319,929.—CABLE RAILWAY—Henry Root, S. F.

319,857.—ORE CONCENTRATOR—E. W. Sinclair, Tombstone, A. T.

319,639.—BRICK MACHINE—C. A. Tarragon, Portland, Or.

319,640.—GRAPE CRUSHER AND PRESSER—Isaac Thayer, S. F.

319,657.—GOLD SAVING APPARATUS—V. P. Velmini, Sutter Creek, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possibls (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

THE Yosemite Commissioners have agreed on a site for the hotel to he huilt in the Yosemite Valley, and for which the Legislature appropriated $40,000. It is at the hase of Glacier Point Rock, and around it are splendid views.

NEW BOOKS ON ASSAYING.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

This new work is written hy an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, $1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

These are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

ADDRESS all correspondence to the name of the paper or firm, as either of the publishers or editors connected with the office are quite likely to he absent at times.

Dr. J. H. RAE & CO.,

240 Montgomery St., cor. Pine, San Francisco

LIFE SCHOLARSHIPS.....$75.

Ladies admitted into all departments. Day and Evening Sessions during the entire year.

☞Call, or send for CIRCULAR to CHAMBERLAIN & ROBINSON, Prop's.

THE HOME SCHOOL
FOR YOUNG LADIES,

1825 Telegraph Ave., OAKLAND, CAL.
(Founded in 1872 by the late MISS H. N. FIELD.)

Gives thorough instruction in foundation studies. Admits special students. Prepares for the State University and for any of the Eastern Colleges. The Fourteenth Year will begin on Wednesday, July 20, 1885. Address MISS L. TRACY.

NOTICE TO ARCHITECTS.

$250 for Plans.

THE DIRECTORS OF THE INSANE ASYLUM OF Arizona propose to erect an asylum of sufficient size and capacity to accommodate 100 patients, near the City of Phoenix, in Maricopa county, Arizona Territory, and for the purpose of obtaining plans and specifications suitable for such an institution, hereby make the following offer to Architects, namely:

FIRST. The Directors will receive plans and specifications offered by Architects, and place on file with their Secretary, N. A. Morford, at Phoenix, Arizona, on or before the 3d day of July, 1885.

SECOND. On said day, or as soon thereafter as practicable, the Directors will examine all the plans and specifications offered, and if any one of them shall be approved by the Directors and adopted for the construction of said asylum, they will pay to the party offering the same, two hundred and fifty dollars; but the Directors reserve the right to reject all plans and specifications offered.

THIRD. The material to be used in the construction of the buildings will be brick, iron, and wood, unless some different material shall be found which is more desirable and which can be supplied for an equal cost.

FOURTH. The cost of the whole construction must not exceed $45,000.

FIFTH. The buildings must be complete in themselves, but so arranged that their capacity may be largely increased with facility by additions without changing or removing the structure.

SIXTH. The prices of material and labor at the site of the building will be approximately as follows, viz.:

Lumber per M., finishing and flooring	$65 00
Lumber per M., rough	45 00
Brick laid in wall, per M	14 00
Rockwork for basement, per perch	3 50
Iron, per lb	4c
Lime, per 1,000 lbs	2 00
WAGES. Carpenters, per day	4 00
Bricklayers, per day	5 00
Laborers, per pay	2 00
Painter, per day	4 00
Plasterer, per day	5 00

SEVENTH. The climate is temperate, but the mercury ranges high during about three months of the year, and then it drops to the freezing point in winter, occasionally, and hence provisions must be made against extremely warm as well as cold weather. The temperature ranges approximately as follows:

	Maximum, Means for 1884.	Minimum, Means for 1884.
January	70.1	31.1
February	70.5	34.5
March	76.1	32.0
April	85.2	40.8
May	03.4	40.1
June	103.4	55.7
July	109.0	66.3
August	104.2	63.2
September	89.9	48.3
October	93.0	51.3
November	83.2	40.1
December	67.8	36.1

All plans and specifications sent by mail or express must be prepaid and marked "Plans and Specifications for an Insane Asylum," and addressed to the Secretary of the Directors of the Insane Asylum, Phoenix, Maricopa County, Arizona.

Plans and Specifications will be returned, if required, on receipt of cost of transportation. N. A. MORFORD, Sec'y Board of Insane Asylum Directors.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

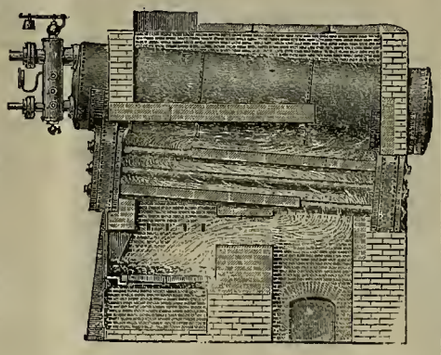
HEINE PATENT SAFETY BOILER

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

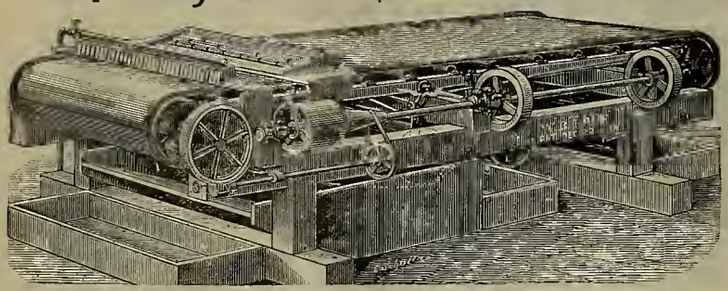
JUSTINIAN CAIRE, Dealer in Mining Material, Agent, 521 and 523 Market St., San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

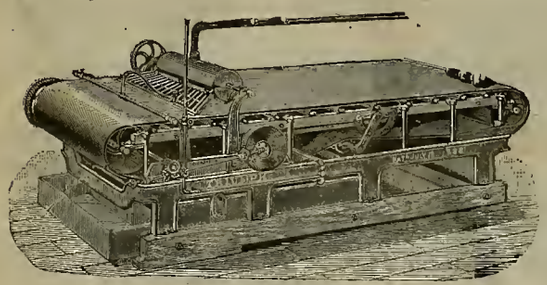
Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street. - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with a curate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we **hereby accept the Challenge of $1,000**, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

....BUILDERS OF....

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

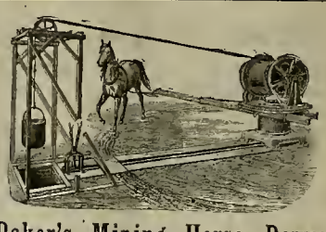
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

SAN FRANCISCO, SATURDAY, JUNE 27, 1885.

VOLUME L. Number 26.

Injectors for Feeding Boilers.

The uniform feeding of water to boilers is an important economical factor in their use, and we present in the accompanying cuts illustrations of two superior forms of injectors manufactured by Messrs. James Jinks & Co., of Detroit, Michigan, who have constituted the Joshua Henry Machine Works of Nos. 39 to 51 Fremont street, this city, their agents for their sale in these Pacific States.

The "Union" Injector, which the manufacturers have recently devised and introduced, is a simple and effective one-lever machine. One movement starts and stops the machine. There is nothing about it to get out of order, while the simplicity of it is such that any one can operate it. As a lifting injector it works equally well while taking water under pressure. It requires no adjustment for varying pressures of steam, and for simplicity, ease in operating, reliability and effectiveness the makers claim it has no equal.

The Duplex Injector is the name that was decided upon as best expressing the operation of this injector. It is a combination of two injectors, the operation of one depending on the operation of the other, and so adjusted that one governs the other in such a manner that it requires no special adjustment for varying pressures, hot or cold water, water under pressure or suction. It is one of the best appliances known for feeding boilers, as it always delivers the water hot to the boiler, and all the steam used in operating it is returned to the boiler, there being no loss of pressure or heat except by radiation, and if pipes are covered, practically no loss whatever.

There are no movable parts for adjustment, no valves to wear, so as to impair the working of the injector, and is not liable to get out of order. It is superior in design, material and workmanship, as it is made with the most improved machinery and tools, so as to duplicate each size perfectly in each particular part.

These machines will lift water 25 feet and force it into the boiler. They will put water into the boiler varying in temperature up to 185 degrees of heat, according to amount of steam pressure carried. Water can be drawn from it for any purpose without interrupting the feed.

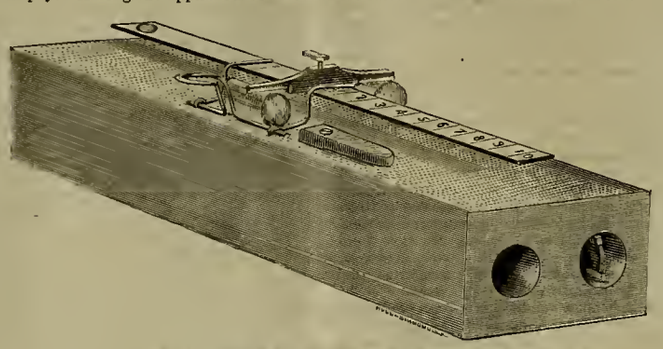
The "Duplex" can be started when hot, a fact which those that are versed in injectors will admit as a decided advantage. It is not necessary to cool this machine before starting, it is always ready. The Duplex Injector is manufactured under the only patent upon which a lifting injector can be constructed.

The constantly increasing sales of both the "Union" and the "Duplex," and the testimonials which are at hand confirming their effectiveness and reliability, are guarantees of their superior features. They will be found useful in the operation of stationary, marine, or any other form of boilers, and the agents assure us that their operation is well worthy of study by users of boilers as a safeguard against danger, and from the standpoint of economy.

THE Supervisors of Cochise county, A. T., voted $600 to send a representative to Washington to place the Indian question properly before the President, but an injunction was issued against the payment of the warrant.

A Prospector's Balance.

Mr. Melville Attwood, of this city, a gentleman who has all his life been connected with the mining interests in a practical way, has devised a simple working test for gold ores by which, with the aid of certain simple appliances, he is enabled to tell to a nicety what an ore will pay. Among the appliances connected with this test is a prospector's balance, an engraving of which is shown on this page. Mr. Attwood in giving a description of the balance says:



ATTWOOD'S BLOWPIPE AND PROSPECTORS' BALANCE.

Amongst the many difficulties I had to encounter in making the working test was first getting the rock properly and rapidly crushed, and afterward the gold washed out of the crushed rock and amalgamated without loss of gold. Messrs. Taylor's hand crusher I found answered very well for the crushing, and the improved form of hatea for washing out and amalgamating the gold in, but to complete the outfit I required a portable, accurate and cheap balance. After many attempts, in which I was kindly assisted by M. G. Rockwell and M. Bohn, I have at last succeeded in making a balance which I think will answer the purpose so well that Messrs. Taylor are now making one something after the same pattern, but with improvements.

The balance and frame, as shown by the accompanying drawing, is about seven inches long and one and a half wide, and one inch deep. The balance is a German silver beam, six inches long and one-fourth of an inch wide, the fulcrum knife edged and the bearings pieces of round glass.

On the right hand side of the fulcrum ten divisions are marked at equal distances from each other, and on the left hand side a small depression is made to receive the globules of metal or a small pan for gold dust. Above the fulcrum is a small vane, which being turned to the right or left adjusts the beam to equilibrium.

The two small wires resting upon the beam keep it in place while the globules to be weighed are being placed on the beam. By a very slight pressure with the finger, the wires are raised and allow the beam to work.

The number of weights required are three, made of flattened wire, viz., 10 grains, 1 grain and one-tenth of a grain. The weights are moved from one division to another as required to balance the globules, keeping the flat side on the lines of division. This balance is very sensitive and will weigh to the one-thousandth part of a grain.

Holes are made in the wooden block to hold the blowpipes, pincettes, weights, charcoal, etc. The following table is to be used in connection with the balance:

Prospectors' and miners' gold table to determine free gold per ton of 2,000 pounds average. Sample for working test, four pound average = 28,000 grains:

Weight of Washed Gold; 4 lb. Sample in grains and tenths.....	Fineness, 780; value per oz., $16.12.	Fineness, 830; value per oz., $17.15.	Fineness, 875; value per oz., $18 08.	Fineness, 920; value per oz., $19 01.

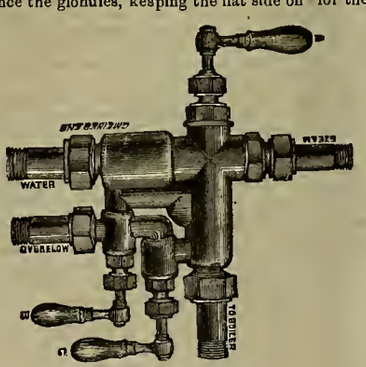
UNION INJECTOR.



DUPLEX INJECTOR.

Our Increasing Population.

During the past few years the population of California has been steadily and rapidly increasing. Last week nearly 1,000 immigrants came into the State. This influx of new residents cannot help being of the greatest benefit to us in every way. Large tracts of land are being cut up into smaller holdings, and these are being properly cultivated by the new arrivals. The immigrants are mainly of the industrial classes, and they come from all quarters of the Union and from abroad. This revival of immigration has mainly been brought about by the active efforts of the State Immigration Association, which has been for some time engaged in disseminating information concerning the State and its advantages. People have been leaving colder climes for a more favored one, and are coming to a comparatively new State where land is rich and plenty, and where there is good opportunity to grow up with the country.

Few people have any idea of the amount of money brought to the State by these immigrants, nearly all of whom have more or less ready capital with which to start life in their new home. The secretary of the Immigration Association, Mr. Street, who is in a position to estimate pretty closely, calculates that the number of immigrants has amounted to 4,000 for the last three months, making a total of 12,000 for the quarter. The capital brought, he believes, certainly averaged $1,000 per immigrant. Therefore the addition made to the wealth of the State during April, May and June was, in his opinion, about $12,000,000. This money has been mostly laid out in building homes, buying stock and such necessary expenses. It has, therefore, been spread over the length and breadth of the State, and after the first crop has been garnered will make itself felt in this city. The locations chosen by the immigrants are in almost every county in the State. A large number have been lately going to San Diego county, where the prospect of the completion of the Atlantic and Pacific Railroad has caused much enthusiasm. Los Angeles and San Bernardino had their share of settlers, while a few enterprising men have located along the coast of Santa Barbara and Ventura. A great many immigrants have gone to San Luis Obispo and Monterey, Southern Monterey having been a particularly favorite locality. Many have settled in the northern counties, Lake and Mendocino, making large additions to the population. Shasta, Sierra and Trinity have also been receiving many new residents, and the whole State is rapidly filling up with a very desirable class of people.

THE car of the United States Fish Commission reached Portland yesterday with 10,000 hard-shell clams from Tacoma. These are a variety unknown on the Atlantic. They are packed in sand from their native beds, covered with seaweed, which is watered twice a day with salt water. They are to be planted at Wood's Holl, Mass.

CHARLES A. BUDDENSIEK, the builder, whose row of buildings on West Sixty-second street, New York, fell in a heap on April 13th and caused the death of Louis Walters, and who was recently convicted of manslaughter in the second degree, was sentenced to ten years' imprisonment and to pay a fine of $500.

Minerals in Amador County.

From an article hy Henry Wolgamuth in the Amador *Dispatch* we make the following extracts

Granite is found in all parts of the Sisrra and Coast range. The quarries of Folsom are known to every Californian; but it is of the finer kind I intend to write. The Penryn granite is a hrownish-colored, fine-grained stone which takes a high polish, and is therefore counted with the marbles. Another kind has heen found in the foothills of Placer county, which is white and of a grain sufficiently fine to he carved in ornaments. It is this kind that is now extensively used in the construction of the larger and more ornamsntal buildings in San Francisco. There is a quarry three miles southwest of Pine Grove, also at New York Ranch, which contains a white, fine-grained granite, which, when quarried and sent to San Francisco would find a ready market. There is a ledge of white granite on Sutter creek, helow the lime kiln, but it cannot bs shipped before a good wagon road is huilt.

Sandstone.

One of the most demanded stones at present in the construction of buildings is a sandstone of a good color, and such a texture that it does not rot. The grain should he fine so it can he carved in ornaments. Such a ledge of such extent as to last for years, would hring the discoverer a snug fortune. I am told that there is sandstone around Plymouth, hut I cannot judge of it as I have never seen it. In the vicinity of Michigan Bar there was worked a white sandstone some 30 years ago, but that stuff is worthless, as the many monuments rotting in the cemeteries proves. But still I thiuk there may be found in the lower foothills a stone having all the qualities necessary in a suitahle building stone.

Talc or Soapstone.

Nearly every miner knows this mineral and its fire-proof propsrties. Until now, few had thoughts of its heing sawed and worked up in chimneys or fireplaces instead of importing fire bricks. There is a new industry waiting for a man who has sufficient hrains to carry out this problem. There are in Europe fireplaces several hundred years old, which are constucted of talc. The dark kiuds are the most durahle for that purpose. There is another kiud I will write about, that, till now, has heen found only in New Jersey, and which is sold to every part of the civilized world where there is a mill to manufacture paper. This kind of talc is slaty; it must divide in thin leaves or flakes, the thinner or finer it splits the hetter it is for mixing with paper pulp. It should he snow-white or scarcely perceptibly hluish.

I think this mineral can he found hetween the Cosumnes and Mokelumne rivers, and east of the town of Sutter Creek. When and where there is a ledge or cliff of light or white talc, or soapstone, there is sometimes on both sides a fatty clay. That slaty stuff will, by reason of its construction, rot quicker, and to a finer mass, than the more compact masses of talcstons. The rains will wash the surface ground down, hy which an originally white stuff will he soiled and colored a great deal, hut hy throwing the top aside, and digging for it as a miner does for a quartz ledge, perhaps a good paying ledge may he discovered. For the best snow-white talc $400 a ton is paid; government price per acre, $2,000. In my travels from Oleta to Volcano I observed several such ledges, but as it was not my profession or trade I paid no attention to it. But I expose it now; perhaps some one may remember such a stuff, and I should he glad if my advice has put money in his pocket. Other clays, porcelain earth, haryta, graphite or plumbago, I shall reserve for other times.

Magnesia

Is a mineral which is used in many ways in the arts and sciences; in chemical works to prepars the several kinds of chlorides, hut principally in the manufacture of steel. Magnesia is a half-metal, and is generally a reddish hown, sometimes hlack, and occasionally dark purple. In the fracture it resembles glass; is heavy like iron, so that many think it is an iron ore. Some magnesia is found in connection with iron. In Volcano it is found in rodales of irregular form, mostly roundish with a smooth shiny surface, in houlders of two feet in diameter to ths size of a pea, often hollow inside. This has little commercial value, but if found in ledges of a foot and more, and of sufficient length, depth and width, it will pay to investigate if there is anything in it. With two per cent of tin it will make the discoverer a rich man. Magnesia ore is much used in preparing Bessemer's steel. The ore is first purified and melted; foundry men call it then spiegel eisen. The hest comes from Westfalia, North Germany. Magnesia ore has a value according to the percentage of metal. Ore of 60 per cent is worth $50 per ton. Magnesia ore sometimes contains iron, tin, zinc, and osmisum. Magnesia ore should always be given to a mineralogist who is also a good chemist. This mineral is mostly found east of the town of Sutter Creek, near limestone formations.

Diatomite, or Polishing Stone.

I found near the limestone a mineral, stone and earth, which marhle-cutters call "hone and polishing putty." Diatomite is used for polishing marhle and other minerals or metals. In the fracture it looks like a fine sandstone. When smooth it is either grayish grsen or yellowish green, with minute points of a darker color spotted. When of even grain it will make the hest whetstone, and the finer kinds are used for sharpening razors or for polishing gold or silver. The form of ths stone is lentil or sparoidal, some round, some oval, hut always flat, and in size from a walnut to three feet in diameter. This mineral is found as a stratum hetween clay-slate. The earth surrounding the stones contain a salt, which, mixed with the acids used in polishing marble, does the work in half the time, and gives the surface a hetter gloss or shine.

Placers and Water Rights.

A decision has heen rendered hy the Acting Secretary of the Interior which will interest miners. It is in the matter of the appeal of Rohert S. Hale from a decision of the Commissioner of the General Land Office holding for cancellation his numerical entry in Jefferson county, Helena district, Montana, declining to revoke the former decision. The Secretary says:

It appears that appellant seeks to procure patent to such claim solely upon the hasis of a mere water right, consisting of two large and several smaller reservoirs, made hy dammiug the outlets of natural lakes or hasins which are connected hy an aqueduct or ditch alleged to he some twenty-five miles in length; and that the aggregate cost of the same, together with two cahins, was $20,300. This seems to have been constructed for the sole purpose of conducting the water power thus stored to distant placer claims situated in another township.

It is true that the field notes state that the improvements, which consist of the said reservoirs, were constructed for placer mining purposes, hut it nowhere appears, nor is it even so much alleged, that they were constructed for the requisite purpose of developing the particular claim in question.

The most important feature of the proofs required hy your office regulations under the mining laws, is that touching the mineral value of the particular tract claimed, together with that showing lahor performed, or improvements made either hy the claimant or his grantors to develop the claim. Now ths proof furnished in the premiscs is so exceedingly meager as to he virtually incompetent or insufficient.

There is not a scintilla of proof establishing the existence of mineral within the claim in question. Indeed, the only allusion to such existence is contained in the claimant's own affidavit, and that of one Benjamin F. Marsh, U. S. Dsputy Surveyor, who states that he has heen informed and believes that a placer deposit of gold exists along the hed of the streams delineated upon the official plat of survey. But he also states that no placer mining work has heen done upon said claim, the aforesaid reservoirs, which are the only improvements thereon, having heen constructed hy the applicant at great cost, for the sole purpose of conducting water to placer mines situate in another township.

It is true that applicant's attorney filed two affidavits in yonr office on or ahout January 23, 1883, in support of his motion for reconsideration of the aforesaid decision of Novemher 16, 1882, alleging that some portion of the claim in question might he profitahly worked for mineral; hut their allegations are hased upon prospecting done in the years 1872 and 1875 and do not show that the claim was at the date of the affidavits, or that it ever had heen worked as placer ground, either hy the claimant or his grantors, I therefore concur in the opinion that the patent is not actually sought for a placer claim, hut for a water right, and that it is not competent to issue such a patent. See Chessman Placer Claim, 10 L. O., 322. I accordingly affirm said decisions.

PROPOSED SMELTER AT HELENA.—The committee appointed to interview the husiness and mining men upon the advisability and to solicit suhscriptions for the proposed new smelter, are still hard at work, and although the work seems to he progressing slowly the ultimate success of the enterprise seems to be an assured fact, and as soon as two promiuent mining men return from the East, who have gone there partially for the purpose of talking smelter to some Eastern capitalists, the entire matter, if Helena will do her share toward raisiug the required amount, will finally he favorahly terminated. The business men here seem to he more favorahly inclined to help the project along than do the realestate men. Why the real estate men seem to he thus standing in their own light no one seems to understand. A smelter or smelters in Helena is acknowledged hy them to be a good thing and yet they won't subscribe and are depending upon poor men who own mines and have scarcely money enough to huy their "grub" and tools, to do the building. They don't stop to think that these are the men that should he helped along and the men that generally help a town or city. If you give them an opportunity of selling their ores they will all have money and Helena will reap the reward. If you don't help them along, you will always have a lot of hroken miners on your hands and the business of this community will have to look—well, we don't know where for its reward. Let the matter have its just consideration and we feel satisfied that you will contribute liherally. *Helena Independent.*

Mining Management.

The numerous letters addressed us lately show plainly enough the management of gold mining companies for several years past has heen lax in the extreme. Fat appoiutments of chairmanships have led to jealousy among aspiring directors and those who want to attain the position, and all kinds of manœuvres and ungentlemanly proceedings have heen adopted to oust one set of occupants for others equally incompetent to jump into their places. Experts who havs heen engaged to report on the prospects of mines or to act as consulting engineers, if their reports havs heen unfavorable, from the vendors, directors or shareholders' point of view, whose hopes are to hear their properties praised, whether dessrving or not, are treated with scant courtesy, or prohably dismissed from their appointments, and sometimes without payment for services. Directors and shareholders in England who canuot be expected to understand the details or nature of gold mining, should he guided by the advice of experienced men whom they engage, and not ignore their advice merely hecause it is not in accord with their own ideas or wishes. The letters of Mr. Cornish on the West African gold mines, and those of Mr. Kitto on the Spanish gold mines, go to prove what difficulties and opposition heset the path of mining experts, who, having had a long training in practical gold mining, give straightforward and honest advics as to the value of properties, or how to conduct mining operations, are almost certain of giving offeuse to certaiu interested parties who appear to dssire their mining reports served hot and spicy, and flavored according to the taste of their employers. It is surprising to think that ordinary shrewd business men should on entering into gold mining ignore the first principles which guide their conduct in their own private affairs. The manufacturers of woolen goods would not engage an iron-worker to manage their business, nor would the ironmaster employ one accustomed to the making of silk or woolen textures, to take charge of iron works. Yet when the business of gold mining is undertaken almost any one is supposed by some people to hs qualified for conducting the works and directing the geueral management. The consequence has heen that many unqualified and wholly incompetent persons bave heen sent ahroad to conduct mining operations, that in many cases these so-called managers have gone out to the mines unprovided with money or material, and have heen expected to carry out important works and rsalize great results without efficient plant or material to work with. Direc ors and sbareholders have heen deceived hy extravagant statements made hy enthusiastic amateurs, who have in too many cases allowed their imagination to run wild with excitement at seeing a few specks of gold in a piece of quartz, and having had no practical knowledge of mining themselves, they imagined the whole bodies of quartz would average the same quality as a few picked specimens. Reports were made on assays of samples, and minute calculations made of possible profits on imaginary results, which, like many other visionary dreams, became rudely dispelled on practical demonstration of facts hy the hest of all tests, the operating on a quantity of matrix. We know of a case on the west coast of Africa, where a mining manager was sent ont to take charge of the management of a mining company, and to erect heavy machinery hefore the mine had heen opened in any way, and who had hut £5 when he landed, and no definite arrangements made for giving him credit or supplying him with the necessary funds to enable him to carry ont his work. Of course the manager was himself much to hlame for going out on such a wild goose chase. He may he a very good working miner; hut he was evidently a bad husiness manager to undertake such duties without making himself acquainted with the pecuniary position of the company, and taking care to he provided wi h funds to pay enrrent wages and expenses amongst the natives on the coast. The mining manager, who undertakes the responsihility of carrying on mining operations abroad and to erect machinery, should not only be competent for his work as a minor and engineer, hut as a business man should carefully calculate his ways and means, and take good care not to start hefore he is ready, nor trust to the tender mercies of an impecuuious company or hard-hearted directors, who would leave their managers to starve or die upon an inhospitahle coast, while loudly crying out for more "planks and money." In this case the company had a nominal capital of over £70,000, and while they could find a capital to pay the vendors a hig price for comparatively untried and, therefore, worthless property, with no shaft sunk or lode proved, nor even a title property secured, the directors could not find funds to enahle their manager to prospect the property; hut with the apparent object of making a show of doing something for their money they purchase and send out a large, expensive and useless plant and machinery without even funds to pay the duty on landing, much less to erect it. The company is in a morihund state; the manager had to get away from the port in a surreptitious way, leaving the poor natives in debt for wages, while the useless machinery is lying rusting on the grounnd, and disgrace and discredit rests upon all concerned.—*London Mining Journal.*

Stick to Your Business.

It is the great desire, expressed or unexpressed, of every human heing to succeed in life, and to secure success nothing is more important than that a person should have a continuity of purpose—a fixed aim of life. When once, after careful thought and study, a young man makes up his mind to follow a certain line of business or effort, when his heart and hrain are in perfect accord, there need hs no fear of results if he will only stick to his purposs.

The great difficulty lies in the wavering disposition of young men. The world presents a great and varied held for effort. It is too often the case, where success is not realized at once, that a young man seeing others around him grasping the prize in other directions of efforts becomes impatient at his apparent failure, throws up what he has actually gaiued, with the determination to start anew in what may appear to him a more favorable dirsction. Instances liks the following are of every-day occurrence:

There is a diligent mechanic; he has made fair hut slow progress in huilding up his husiness. He sees a hard-working farmer near hy, who is growing rapidly rich hy large crops of fruit or grain. He resolves to forsake his shop and tools, sells out, and huys a farm. It is not surprising that he makes fatal mistakes in a business to which he is neither adopted nor educated. His crops fail and he loses all. The reverse is quite as often seen.

Then again there are those who wish for ths good things of life, who desirs success, hut in an aimless, listless sort of way, which never can succeed. They sit listlessly ahout and envy those who are meetiug with success, hemoaning their own had luck and attrihuting to some mystsrious power or fortune the success of others, which really comes only from careful study, iutslligent and hard lahor, and ths great motive power of all successful effort—the will.

Mark the unsuccessful men in any community—the men who never get ahead, and you will find that they all helong to the one class or the other to which we have ahove alluded. Either they never stick to one business long enough to find what there is in it, or they are of that lazy, listless kind who never work except when circumstances compel them iu that direction.

The frequent changes from one employment to another is one of the most common errors of life, and to it can he traced a great majority of busiuess failures. There are cases, it is true, where men bscoms disappointed in business, and meet with success hy changing the same; hut in nine cases out of ten greatsr success would have been achieved hy sticking to the first effort.

It is seldom that life success is achieved unless the purpose and aim of the man is carefully and deliherately formed at the outset and steadfastly adhered to throughout all the succeeding years of life. His life purpose must hs made to shine out hefore him like a heacon light in the far distant future, toward which he must press with a fixed purpose, turning neither to the left nor right till he reaches the haven of success.

Such a life purpose will grow and develop nntil all else hecomes suhservient to it. All we need to lead us to success is tne will to do, the physical strength to carry out that will, and confidence in ourselves. Let othsrs make or mar their lives as they will, hut let it be our effort to hold firmly to a continuity of the purpose we have carefully formed and success will surely crown our efforts in the end.

The Idaho Silver Convention.

The Wood River mining and Industrial Association held a meeting in this city, which was quite numerously attended.

Mr. Havens, from the committee on freight rates, recommended concerted action to increase the ore tonnage and secure lower rates.

Ths committee on sampling reported the lowest rate east of Utah for such work to he 75 cents per ton for whole samples. West of Colorado no sampling is done for less than $2 per ton for half samples. Where the sampler crushes the ore, 50 cents extra is charged per ton.

The meeting resolved that it is the sense of the association that ores should not be taxed, and James H. Beatty, V. S. Anderson and George A. Black were appointed a committee to confer with the county officials on this question.

G. L. Havens, E. B. Trne and Isaac Whisler were appointed a committee to confer with the county commissioners in relation to the opening of roads to the different mining sections of the county.

The association indorsed the resolutions adopted by the convention of silver miners held at Denver, Colorado, last winter, which demand the unlimited coinage of gold and silver, and call for the enactment of laws to enforce such coinage; also, calling upon Congress to retire all one and two-dollar hills from circulation.

E. A. Wall, W. H. Watt, W. H. Pettit, Geo. A. Shoup and other prominent mining men of Idaho were appointed a committee to issue a call for a Territorial Silver Convention, to he held at Hailey.

The association adjourned until Wednesday, July 1, 1885.—*Hailey Times.*

MECHANICAL PROGRESS.

What American Inventors Have Done for the Locomotive.

Take a standard eight-wheel engine, good for almost any kind of service. The high pressure, high speed engine itself, so simple and efficient, is the invention of Oliver Evans; the multi-tubular boiler, so essential to rapid steam making, and without which no train could have been kept running more than ten miles an hour, was invented by Nathan Read, an American. It is carried in compact form by four coupled driving wheels and a four-wheel truck, a combination patented in 1836 by Henry R. Campbell, of Philadelphia, the truck having been previously invented by John B. Jervis, of Rome, N. Y. The driving wheels, of cast iron, made made hollow, are the invention of Thomas Rogers, of Paterson, N. J., who was also among the first to use weights secured in the wheels to counterbalance the momentum of the reciprocating parts. Allen paper wheels—a thoroughly Yankee notion—carry the engine truck, and the tender is sustained by cast iron wheels with chilled thread, first invented by Ross Winans, of Baltimore. The single bar frame, holding cylinders placed horizontally and bolted together in the center, is another remarkably strong and compact combination, designed in part by Winans, but put in its present shape by William Mason, of Taunton, Mass. All the pipes and joint connections are secured against leakage by the ground joint, invented by M. W. Baldwin, of Philadelphia. This water pump gets a steady action and is secured from breakage by the air chamber invented by Walter McQueen, of Schenectady. Expansion braces, first brought out by Rogers, give the fire-box a secure hold on the frame, yet permits the boiler to lengthen or shorten, as change of temperature requires. The weight of the engine is distributed evenly to the axle boxes by means of equalizing levers, invented in 1837 by Joseph Harrison, of Philadelphia. Two fixed eccentrics, invented by William T. James of New York, give movement to an Allen slide valve, balanced by a Richardson device. Spark-throwing is restrained by an extended smoke-box combination, invented by John Thompson, of the Boston & Main railroad. Combustion is admirably promoted, and smoke-making prevented by the Buchanan design of fire-box, which is constructed of mild steel, first made successful for that purpose by the Baldwin Locomotive Works. The engineer and fireman sit comfortably in a convenient cab, first applied by David Matthew, but since improved by every builder in the country. As the locomotive thunders along through the blackness of midnight over giddy chasms spanned by traceries of steel, over the dangerous grades of mountain scenery or through the sameness of western plains, the engineer sits calm and steadfast, secure in the knowledge that engine and train are perfectly under his command. This entire confidence is begotten of the knowledge that a turn of his hand would grasp every wheel in the train between vise-like brakes shoes, applied by that greatest life saver of modern times, the Westinghouse automatic air brake, one of the most valuable parts that the American inventor has added to railroad machinery.—*Angus Sinclair.*

Steel Against Iron.

William F. Zimmerman, of the Pittsburg testing laboratory, has completed for the Detroit Dry Dock Company a test of the steel plates which will enter into the construction of the new steamer for the Detroit & Cleveland Steam Navigation Company. The average tensile strength of the plates is 60,000 pounds to the square inch. This soft steel is of such remarkable elasticity that a piece of plate may be stretched one-half longer than its usual size without parting. The Detroit Dry Dock Company recently made some experiments of its own with the soft steel used in the construction of the new steamer *Mascotte* at its yards in Wyandotte. They were made both with soft steel and the best quality of iron used in the construction of iron ships. Strips of cold steel plate, 3-16 of an inch thick, and ¾ of an inch wide were twisted like an augur in a lathe, and even so far that they doubled without cracking or causing a single abrasion of the metal's surface. Angle irons were flattened cold and bent in like manner. Another strip was bent repeatedly without causing it to break or even flaw. In the presence of the owners of the *Mascotte* a large ball weighing 950 pounds was suspended at a height of 35 feet and allowed to drop on a 3-16 plate, bulging it about 20 inches into the ground without breaking it. The ball was then dropped on the reverse side of the plate, and this repeated five times without breaking the plate. The same test was made with a one-half-inch iron plate, and it was broken the first time. These tests are regarded as furnishing a conclusive demonstration of the comparative merits of soft steel and iron for resisting sudden shocks, and consequently of their respective merits as materials for the construction of modern ships.

GLASS COMPOSITION—A NEW ALLOY.—A new alloy, known in Germany under the name "glass composition," and placed in the market by Mr. Louis Dill, of Frankfurt-am-Main, is reported to have found extensive application in that country. It is said to possess the qualities of the best composition used for bearing surfaces. It contains a certain percentage of a vitreous substance, which, expressed in figures, is very trifling, but is stated to be sufficient to impart to the alloy a durability and uniformity not hitherto reached. Even at a high rate of speed the heating of journals is said to be avoided, and their unequal wear prevented. Moreover, the first cost of the composition is reported to be less than that of alloys of equal efficiency at present in use; and it is finally said to stand wear and tear remarkably well, even with a small amount of lubrication, and to be proof against atmospheric influences and the action of diluted acids. This is certainly a very promising invention, but the admixture of glass would, we should have imagined, have acted prejudicially on the bearings. But we live in an age of surprises.

Journals and Bearings.

When allowance for oil space is made, says a contemporary, the fitting should be as carefully made as though the ons surfaces was to be driven on the other. That is, the bearing should be cylindrical as well as the journal. The surface should be fitted up with a scraper, where the bearings are large, and brought to a uniform fit. Fitting so that the journal is a true cylinder, while the bearing is bored a double cone-shape, or elliptical in cross section, would never do. The journal would press through the oil at the high place on the small parts of the cone, and here would be abrasion. But by the use of a scraper or file, or both, after the lathe work is done, the bearing and journal may be brought to a near fit, so that the needed film of oil will have a uniformity of thickness along any line lengthwise, and be but slightly crescent-shaped with true circle outlines in cross sections through the bearings. Such a bearing will be expected to run cool, while the bearings, which "will soon wear to fit," will not run cool. In the latter, a cool bearing, seems never to be possible, because at first wear is expected in place of scraping, to reduce the points to be worn off, and such wear requires contact of bearing and journal. That contact will injure the journal, making it rough, which in turn will cut the bearing unduly. Now, by the time some degree of evenness is supposed to be gained there will be too much space for the oil. The shaft will then tumble about, knocking against the bearing with such force as to cause metal contact and rubbing. Both of these actions produce heat as well as continue in aggravation the cause of that heat. In short, in order that machinery bearings and journals shall be correct they must be made right. The "wear to fit" is utterly out of the question in first class work; that is to say, fine journals and bearings do not grow like weeds, but must be the result of skill and good judgment, as well as other things.

NEW METHOD OF MELTING IRON.—A new method of melting iron has been devised in Germany. The cupola is supplied with blast through two tuyeres, one above the other, there being eighteen in each set; the tuyeres are ports, with the form of a vertical slat, are directly connected with a tuyere ring. The particular feature of the cupola is that the bottom is a slightly inverted arch, which is pierced by two openings, through which both blasts, or rather imperfectly consumed gases of combustion, and the fluid iron can flow. Below is a small chamber in which the iron collects; it is heated by the gases forced downward from ths cupola above, these being supplied with the necessary air for combustion by a special tuyere leading from the main blast pipe—ths chamber at the same time serving to preheat scrap, etc., which need only to be pushed into the bath for dissolving it. Of course, considerable quantities of scrap can be used by directly charging an ordinary cupola; but it is claimed in this case the advantages presented are economy of fuel and a greater facility for making sharp, strong castings and a purer description of metal.

IMPROVED METHOD.—A new method of manufacturing merchant iron from scrap iron is as follows: Upon the supporting board are placed two angle-irons, their upright parts projecting upward from the long edges of the board. Between these angle-irons the scraps are piled up and then the mass is placed into a furnace and is said to be ready for rolling after the application of a single heat. The object of the angle-irons is to form solid edges in the finished iron, a result that could not be accomplished by the old method without double heating. For rectangular bar iron two additional angle-irons should be placed upon the upper edges of the pile. This process has been patented by G. Westerman, Sr., of Lockport, N. Y.

CELLULAR STRUCTURE OF MELTED STEEL.—Microscopical examination shows that molten steel possesses a kind of cellular tissue, the iron forming the nucleus and the carbon the envelope of the cellules. These simple cellules form agglomerations which the authors term compound cells. These latter cells may be easily identified with what is ordinarily called the grain of the steel; their surfaces are therefore regions of least cohesion. Hence the fraction of a bar of steel is the surface which contains a minimum of carbon.

SCIENTIFIC PROGRESS.

How Dew is Produced.

When, in consequence of radiation, objects near the earth's surface, such as grass and leaves of vegetables, become cooled below the dew point in their vicinity, they condense upon themselves a portion of the vapor which is present in the air, and this is called dew. The amount of dew thus deposited is greatest upon those substances whose temperature is the lowest, being proportional to the amount of depression of their temperature below that of the dew point. Dew, therefore, does not fall from the sky like drops of rain, but the vapor of the air is condensed by coming in contact with the cold surface of the object upon which the dew collects. The collection of moisture on the outside of a pitcher of cold water on a hot day is precisely analogous to the formation of dew. In some parts of Egypt and Arabia nearly all the moisture the earth receives is that obtained from dew. The circumstance most favorable for the production of dew is cloudless nights and full exposure to the sky, an almost tranquil and moist atmosphere. The deposition of dew is immediately checked by clouds, which reflect back to the earth the heat radiated from it. The same effect is produced by an artificial covering, even though of thinnest texture, from which cause plants placed beneath trees or near buildings collect less dew than those fully exposed to a cloudless sky.

A slight breeze, by renewing the air which has deposited its excess of vapor, makes the dew more abundant, but a fresh breeze, by agitation, produces a mingling of the air at different elevations, equalizing the temperature throughout, so the air at the earth's surface cannot become much colder than the superincumbent atmosphere. Little dew, if any at all, is deposited on windy nights. When the atmosphere is most humid, a given reduction of temperature will sooner reach the dew point, at which the deposition of moisture begins. An abundant dew is regarded as an indication of approaching rain, because it proves that the air contains a large quantity of vapor.

Dew is not deposited on the surface of large bodies of water whose temperature is above 40 degrees, for as soon as the particles at the surface are cooled they become heavier and sink, while warmer and lighter particles rise to the top, by which means the surface of the water is maintained at nearly the same temperature as the surrounding air. In the midst of sandy deserts, on account of the dryness of the air, dew is almost unknown. Travelers upon the deserts of Africa and Asia are notified of their proximity to lakes or rivers by the appearance of dew. But little dew is deposited in cities, because most of the objects there found are stronger power radiators than the leaves of vegetables, and because the heat of the city is always greater than that of the surrounding country.

The Formation of Frost.

Hoar-frost is formed under the same circumstances as dew, with the exception of a lower temperature. When the temperature of plants falls below 32 degrees the moisture of the air is condensed upon them in the solid state, and forms a layer of spongy ice. Hoar-frost is, therefore, not frozen dew, but the moisture of the air is deposited in the solid form, without having passed through the liquid condition. Hoar-frost, like dew, is deposited chiefly upon those bodies which radiate best, such as plants and the leaves of vegetables. Since plants sometimes become cooler by radiation from 12 to 15 degrees below the temperature of the air, a frost may occur although a thermometer a few feet above the ground does not sink to 32 degrees. During a clear and still night when a thermometer six feet above the ground sinks to 36 degrees a heavy frost may be expected, and a slight frost may occur when the same thermometer sinks only to 47 degrees. During cold nights of spring, plants which are sheltered by trees are less liable to be injured by frost than those which are fully exposed. A thin covering of straw will generally afford entire protection. A garden may frequently be saved from injury by kindling a fire, which will envelop the plants in a cloud of smoke. Fogs and clouds also protect vegetation from the effects of frost. Plants are often killed by frost in the valleys and up to a certain height upon the hills, while above this limit they entirely escape injury. It has been found by observation that a thermometer attached to a high tower in a valley indicates at night the same average temperature as a thermometer on the side of a hill upon the same level. This indicates that during tranquil nights cold air resulting from radiation at the surface of the earth settles in the valleys in consequence of its greater density, and the warm and cold air are arranged in nearly horizontal strata, like liquids of different densities.

MANUFACTURE OF OXYGEN.—MM. Brin, of Passy, are producing oxygen on rather a large scale by the barium oxide process. They have two large retort furnaces regularly going, filled with retorts of 2 80 meters length and 16 centimeters diameter. In these retorts they calcine oxide of barium, passing over it a stream of air which has passed through quicklime to free it of carbonic acid. During this calcination the heat does not exceed about 500° C., at which temperature the barium oxide absorbs oxygen, becoming peroxidized. The nitrogen is drawn off and passed into gasholders, to be used for making ammonia, etc. When the barium oxide has absorbed as much oxygen as it can, the heat is raised to about 800° C., at which temperature the peroxide is decomposed, giving up again the absorbed oxygen, which is drawn off and pumped into a gasholder. MM. Brin make use of the oxygen so collected in many ways, one being the application of it to the purification of water. Filtered water is placed in a cylinder, and saturated with oxygen gas at 300 pounds pressure to the inch. All organic matter is destroyed, and perfectly pure water results.

Resuscitating Fish.

Mr. W. O. Chambers, secretary of the National Fish Culture Association, of London, conducted lately an interesting experiment in resuscitating fish by the use of brandy, before a number of gentlemen at South Kensington:

Taking two carp from the tanks of the aquarium, he deposited them in separate dry cans. After a lapse of four hours the fish were replaced in water, evident signs of expiration being apparent in both cases. A small quantity of brandy and water was then given to one carp through the medium of a feather, and no sooner was the fish replaced in water than it assumed its normal condition, and seemed to be restored to vigor and strength. The other, to all appearances, died half an hour after its associate, and was taken out of the water and thrown on the ground. About four hours later, however, the fish was picked up by Mr. Chambers, who observed it to be *in rigor mortis*. He then at once operated on the seemingly inanimate fish by opening its mouth and pouring a dose of brandy and water down its throat, and again inserting it in the water, when, to his utter astonishment, he noticed slight signs of animation. For five minutes the object of the experiment floated helplessly on its side, when, to the astonishment of those who watched the experiment, it gradually made use of its fins—feebly at first, but afterward energetically. Both fishes, which show no signs of their late prostration, now swim about with their *confreres* as usual. Similar experiments were made on several other varieties of fish, all with similar results except salmon, with which the experiments utterly failed.

INCREASE OF THE EARTH'S MASS.—Dr. Kleiber, of St. Petersburgh, Prof. Schmidt, of Athens, Prof. Newton, of Yale College, and others have been taking careful observations of late and making estimates therefrom of the daily increase of the earth's mass from the falling upon it of meteors and cosmical dust. The result of the observations is that about 450,000 meteors fall upon the surface of the whole earth every hour, and that the average weight of these bodies is about five grains each, a total of 4,950 pounds per hour, or a fraction short of 60 tons every 24 hours.

That amount of material falling daily from celestial space is certainly no small increase to the earth's mass. The earth's attraction is considered responsible for 20 per cent of this material—the balance of 80 per cent would be increased each hour by a globe the size of the earth even if it had no attraction.

NORWEGIUM.—This is the name given to another new metal, which is now added to our rapidly growing list of elements. It was discovered by Dr. T. Dahll in examining a specimen of nickel ore from Kragero, in Norway. It is a malleable metal, of white color, with a tinge of brown; it presents, when pure, a metallic luster, but, on exposure to the atmosphere, becomes coated with a thin film of oxide; its hardness is about that of copper, and its specific gravity is 9·4441. At 350° C., it melts. From its physical properties and chemical reaction, it appears to differ from every other known metal, and Dr. Dahll claims for it a distinct individuality.

FEATHER FUR.—Fur made from feathers has been used for five or six years for the borders of ladies' cloaks, dresses, etc. Even sealskin cloaks have been imitated with this material. Though an imitation only, the article is in most respects quite as suitable and serviceable as the genuine fur. In some particulars it is even superior, as it may be torn into suitable strips without loss; another advantage is that it is light, pliant, insensible to pressure, and may even be treated with hot water without detriment to the fabric.

A SUB-MARINE BOAT FOR SCIENTIFIC PURPOSES.—From Nice, Italy, comes the information that, at that place, trial trips have been made with a sub-marine boat, designed by Toselli, which will probably be of great service to this naturalist. The boat can penetrate to the depth of about 250 metres, and as it is surrounded by powerful electric lamps, it is possible to subject the sea to minute inspection.

GOLD AND SILVER FERNS.—L. C. Doane says, in *The Microscope;* Upon a slip of glass put a drop of liquid auric chloride or argentic nitrate, with half a grain of metallic zinc in the auric chloride, and copper in the silver. A growth of exquisite gold and silver ferns will grow beneath the eye.

TABLE OF CONTENTS.

EDITORIALS.—Injectors for Feeding Boilers; A Prospector's Balance; Our Increasing Popu'ation, 409. Passing Events; Close of the Volume; The Mining Bureau and the Exposition; Cost of Mining; Selling Claims to Chinese; Action of Oil on Boilers. 412. Material Progress in California; Surface and Underground Men; A Miner's Inch Gauge; Purifying the Water Supply of Cities, 413.

ILLUSTRATIONS.—Atwood's Blow-pipe and Prospector's Balance; Union Injector; Duplex Ejector, f 409 Miner's Inch Gauge; Public School House at Redding, Shasta County, Cal., 413.

MECHANICAL PROGRESS.—What American Inventors Have Done for the Locomotive; Steel Against Iron; Glass Composition; Journals and Bearings; New Method of Melting Iron; Improved Method; Cellular Structure of Melted Steel, 411.

SCIENTIFIC PROGRESS.—How Dew is Produced; Manufacture of Oxygen; Resuscitating Fish; Increase of the Earth's Mass; Norwegium; Feather Fur; A Sub-Marine Boat for Scientific Purposes; Gold and Silver Ferns, 411.

USEFUL INFORMATION.—A New and Useful Paint; Baseballs and their Manufacture; Second Hand Barrels; Embossed Leather; Peculiarities of Animals, 415.

GOOD HEALTH.—When Your Girth Increases; Amount of Exercise Required; Helenina—A New Antiseptic; Some New Corn Cures, 415.

MISCELLANEOUS.—Minerals in Amador County; Placers and Water Rights; Mining Management; Stick to Your Business; The Idaho Silver Convention, 410. Who Own the Vast Lumber Interests on Puget Sound; The Detroit Copper Mines; Experts and Prospectors; The Mining Outlook in Oregon, 414. Sending Logs Down Nevada Mountains, 415.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 416-17.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 420.

Business Announcements.

Life-Saving Respirator—T. E. Jewell, S. F.
Leather Belting - Girvin Anderson & Co., S. F.
Assessment Notice—Gould & Curry S. M. Co.

Passing Events.

As we close the volume with this number, it is proper to call the attention of our readers to the very full index which is given on the last page, and to remind them that this is a proper time to renew their subscription.

There is not very much to report concerning the mining situation aside from what is chronicled in our mining summary. Work is being actively conducted in all quarters with seemingly satisfactory results.

The Bodie Tunnel has been started up again, which is an indication that the mine managers of Bodie are gradually getting the mining industry upon its legitimate basis.

The Austin miners' union has decided to disband, an action that was necessary in order to effect a reduction in the prices of wages. As the union was organized no other way could be used to bring about a reduction to $3.50 per day.

California gold mining continues prosperous, and more prospecting is being done than for many years previous. The water season has been very short this year, so that surface miners will not do as well as usual.

AN artesian well on a desert station in Kern county has been completed, which gives a flow of 1,575,000 gallons in 24 hours, and the water rises 11½ inches above the pipe. The cost was only $700.

Close of the Volume.

With this number is completed Vol. L. of the MINING AND SCIENTIFIC PRESS, which is the oldest publication of a technical nature on the Pacific Coast. When the PRESS was first started the mining industry was confined to comparatively narrow regions, and it has seen this industry gradually widen its field until it has assumed its present magnificent proportions. During all these years the PRESS has been a steady and earnest advocate of legitimate mining as opposed to mere stock gambling, and it has lived to see these principles recognized by all who have the interests of the country at heart. To-day mining is being conducted on a more practical basis than ever before.

It has been the object of the editors and publishers of this journal to collect for its columns everything that would be of interest or value to the classes it represents. Improvements in mining and metallurgy, inventions, mechanical appliances, processes—in fact everything of this kind has been described and commented on as it has came up. Current mining news and progress has been reported in a condensed and readable form in every number.

Everything of interest in mechanical and scientific progress, engineering, etc., has been noted and described. Correspondence from all quarters of the coast, and from most of the mining camps has been published; and our travelling representatives have been constantly on the move gathering the latest and freshest information and details concerning the prominent camps and mines.

The copious index on the last page of this number shows the scope of the subjects treated in the volume. Though mainly devoted to Pacific Coast interests, attention has been paid to much that is going on elsewhere in the Union and abroad. We have endeavored to keep pace with the march of improvement. This year we have moved to more commodious and better quarters, with new editorial and composing rooms, press and engine rooms, etc., and are now in better condition than ever before to advance the interest of our patrons. We shall continue to improve the PRESS, as it is the intention and desire to make it in every way the suitable representetive of the interests to which it is devoted.

The Mining Bureau and the Exposition.

State Mineralogist Henry G. Hanks has returned from the New Orleans Exposition, and the California minerals which were exhibited there have also arrived. As it is the intention of the Trustees to move the State Mining Bureau from its present quarters to the Pioneer Building on Fourth street near Market, which is now approaching completion, the minerals will not be taken from the packing boxes until the new rooms are ready to receive them. Much more commodious and convenient quarters are thus assured for the Bureau.

Mr. Hanks states that the mineral exhibit at New Orleans was very fine, but that of California was undoubtedly the best, and was greatly appreciated. He was invited to speak before some of the scientific societies there on the subject of Californie minerals, and took occasion to explain the workings of the California Mining Bureau. He states that steps are being taken now to establish a similar institution in Louisiana.

While absent Mr. Hanks visited the gold mines in Georgia, and will present a report of his observations to the Governor. He has also prepared an elaborate report on the mineral collections at New Orleans. Both of these reports will be published as soon as practicable.

Mr. Hanks states that great interest was manifested about California. He says, also, that Mr. and Mrs. J. G. Lemmon aided largely in behalf of California, and did good and efficient services which ought to be better appreciated than they have been in all quarters. Mrs. Lemmon had charge of a department of California women's work, in which much interest was shown. Mr. Lemmon wrote and spoke much concerning the State and its products. Taken altogether, Mr. Hanks is of the opinion that the part taken by Californie at the Exposition will greatly redound to the benefit of the State.

DURING May, 8,906 pension certificates were issued, which is the largest number, says the Washington *Star*, ever granted in one month since the organization of the office.

Cost of Mining.

In this State the mining of gold ores has been gradually reduced to such a system that the cost has greatly diminished from that of former years. Gold ore, worth no more than $5 per ton, is being profitably worked, and there is an abundance of this class of ore in the State. Of course the cost of mining varies with the locality, width of ledges, country rock, etc. Perhaps the Alabama mine, Tuolumne county, has been doing its work about as cheap as any. The ore only yields from $3.00 to $3.50 per ton, and contains one per cent of sulphurets, which are not saved. The cost of mining, including dead work, is only 40 cents per ton. In the 40-stamp mill, run by water-power, treating 80 tons per day, the mill treatment of the ore costs 70 cents per ton; total for mining and milling, $1.10 per ton. The mine is worked by open cut and tunnels, but no shaft.

Mr. W. A. Skidmore, the secretary of the Miners' Association, has the record of a representative low grade mine in this State, which shows the relative cost of different classes of mining rock in California. He does not care to give the name of the mine, but states that the country rock is granite, the ledge matter easily broken, the ledge of fair width, and the rates of labor $3 per day. The following tables show the costs and ratio of costs:

RATIO OF COSTS.—[Assume these items to cost 100.]

Items.	Tunnel. Feet.	Tunnel. Tons.	Levels. Feet.	Levels. Tons.	Winze. Feet.	Winze. Tons.	Winze levels. Feet.	Winze levels. Tons.	Raises. Feet.	Raises. Tons.	Cross cuts. Feet.	Cross cuts. Tons.	Stopes. Tons.

Selling Claims to Chinese.

The prejudice against the Chinese as a race is perhaps nowhere more marked in California than in the mining camps. In many camps organized of late years resolutions have been adopted against the admission of Chinese miners. And this not only in California, but in Oregon, Idaho, Montana, Arizona, and in fact in nearly all the mining regions. So much has this feeling been developed that many companies formerly employing them have considered it good policy to displace the coolie altogether. Nevertheless there are many still at work, though most of them are now at work for themselves. They are willing to work for much less than white men, and poor and abandoned grounds are known as "Chinese diggings." They do not often venture into quartz but stick to placers where they can work out a dollar or so a day with the old-fashioned implements. But even this is objected to by many, and there are serious complaints against selling placer ground to Chinese. A good many persons have been selling these placer claims to Chinese where they had no rights to the ground themselves. As a Forest City miner very pertinently says: "How these persons obtain or acquire the right to sell Government lands or give a title thereto, is a question which should be questioned and severely dealt with by the law, for it is evident that this practice works an injury to the many prospectors who are seeking for, and would be glad to obtain diggings where they could even make wages. The excuse of these parties is that the lands sold to the Chinese is of no intrinsic value, it having been worked out, etc." But it is a fact that many of the Chinese miners accumulate large sums on their claims. There is no way of finding out their earnings for they are very close-mouthed, and their dust all goes to China. It is certain that they take out of California soil many thousands yearly.

Action of Oil on Boilers.

On the 25th of May an explosion occurred at the tripe factory of John Bayle, at South San Francisco, by which the engineer named Serrot was injured so badly that he died, and four others were injured end taken to the hospital, but have since recovered.

In this factory three tanks were in use for extracting tallow from meat, etc.. The tanks were made of boiler iron and were 72 inches in diameter by about 11 feet long, having hemispherical ends, and in use were placed upright. They had two large openings or man-holes—one at the top, by which the tank was charged with meat, and the other near the bottom through which the meat was taken out after the tallow had been extracted. The manner of extracting was by putting meet into the tank then closing it up tight and admitting steam from an ordinary tubular boiler, and after the materials had been in contact with the steam eight hours to shut off the steam—from the boiler—then letting the remaining steam escape from the tank, to open it and take out the meat. The pressure of steam generally carried on the boiler for supplying the tank was 80 pounds, and in working the pressure in the tank was usually about ten pounds less, or 70 pounds, so that the tank was required to be strong enough to safely stand this pressure. The tank was made of iron three-eighths of an inch thick, and was, when new, safe for the pressure at which it was worked; but after having been in use some four or five years the iron was reduced to, in some parts, less than one-eighth of an inch. During one day, when the pressure was raised to 120 or more pounds on the boiler, the increased strain on this tank was too much for its decreased strength, and it exploded, with the result above mentioned. It seems that the acids contained in the animal fat have a very destructive action on iron, and this has become known to many engineers through the action upon the iron of steam engines which have been lubricated with lard and other animal oils, so that now engineers refrain from using animal oils to any extent when possible to avoid it. This subject has been brought into prominence by the action of the Association of Stationary Engineers, who appointed a committee to investigate the cause of the explosion that it might be denuded of all mystery in the eyes of the public; and that in view of the peril to which citizens are exposed by many dangerous boilers in this city which are under the care of incompetent persons, the Board of Supervisors might be induced to pass an ordinance requiring all steam boilers to be inspected, and that all persons having charge of such should be examined as to their qualifications for such responsible positions.

Too much care cannot be exercised in the care of steam boilers, and the Engineers' Association are entitled to the thanks of the community for their endeavors to promote the safety and security of those whose business and occupation bring them within the range of injury by explosions of steam boilers.

In this connection comes a question about the actions of various kinds of oils—whether animal or mineral on boiler iron, and as to the safety of admitting any kind of oil in a boiler used either in which to generate steam or in which steam is used under pressure.

It is now generally understood that the natural mineral oils have no injurious effects upon boilers, but experience in some cases has seemed to indicate that petroleum oils fasten themselves on the shell of boilers, forming a scale impenetrable to water; and when this has occurred over the fine surface boilers have been burned. This has seemed to be the case, but a careful observance of all grease or oil of any kind entering into a boiler, and patiently watching the action by our engineers, will do much toward throwing more light upon this interesting but not entirely well-understood subject.

BY the first of next month every iron and steel mill in Pittsburg and vicinity, with one exception, will be using natural gas for fuel. This will reduce the consumption of coal here 38,250,000 bushels per annum.

Material Progress in California.

The prospector is the pioneer of the mining industry, and the miner in his turn has on this coast been the pioneer who has opened up new regions for civilization and progress. He, in the progress of his work, builds roads, improves water-courses, starts towns, settles up the country, brings in his train the men who must feed, clothe and furnish him with necessities, and reclaims from solitude the tracts and regions which are in the end to support the growing population of the country. All this is particularly true of California. Most of the cities and towns of this State are the direct result of the miner's early labors. Their sites were selected for his convenience and they were established and came into being because of his wants. Some have disappeared because the miner deserted the locality, which others have contrived to grow and flourish because of the existence of a population which has displaced the miner of early days.

Agriculture and the mechanic arts have in this country followed the miner. They first come to assist him, and then, when his occupation is gone, they take the field he has left and grow in prosperity until almost the remembrance of their origin is forgotten.

Examples of this are to be seen on every hand in California. Old mining towns have been rehabilitated and an entirely different population substituted. The miner forms a very small proportion of the inhabitants, and even he has lost his nomadic habits and has become a settled-down citizen. Mechanics, citizens, tradesmen, manufacturers, merchants, farmers, horticulturists, professional men and similar classes make up the towns, which are now like those in older countries, having cast off the habits of early days.

Perhaps in no place are these changes more noticeable than in the northern part of California. The towns there are many of them as old as the State, and for years were mere mining camps. During the past decade they have emerged from the position of camp to that of town or city. Railroads run in every direction. Farms and orchards abound on all sides, and the towns have an appearance and character of stability, formerly not marked.

This line of thought occurred to us the other day in seeing that a $10,000 schoolhouse had been built at Redding, in Shasta county. This is not an isolated instance, of course, but it is a mark of progress of the interior of this State, which speaks volumes for the stability and prosperity of Northern California. The engraving on this page shows the appearance of the structure. The group for which it forms a background is a characteristic one. These youngsters are those to whom we must give way by-and-by, and who will conduct the affairs of the State in future years. The children thus brought up in the mining and farming regions furnish our sturdiest minded and bodied business and professional men. Pure air and habits of industry, the cultivation of simple tastes and recreations, and the freedom from the many evil surroundings of a city, give them a grand start to make good men and women.

The revived interest in the section of Northern California is only an earnest of what is going on all over the State. Southern California has been having a "boom" for some years, and has increased in richness, population and influence greatly. Northern California with its many advantages has been more or less neglected, but now attention is turned that way it is experiencing a revival which will soon put it on par with other sections of our favored State.

TIMBER DESTRUCTION.—Deputy U. S. Marshal Mellus a few days ago visited Placer county and served a complaint and summons on two mill owners, for cutting timber on Government land. The parties are charged with cutting 2,500,000 feet of pine timber, valued at $30,000. The case will be tried in the United States Circuit Court, and the defendants have 30 days in which to answer. The deputy marshal was informed while in Placer county that Chinamen near Indian Springs were cutting immense quantities of sugar pine on Government land. The trees are cut by them to be made into "shooks," and if their grain is not perfectly straight the trees are abandoned and other trees cut down. By this method great quantities of trees are felled and not used for any purpose.

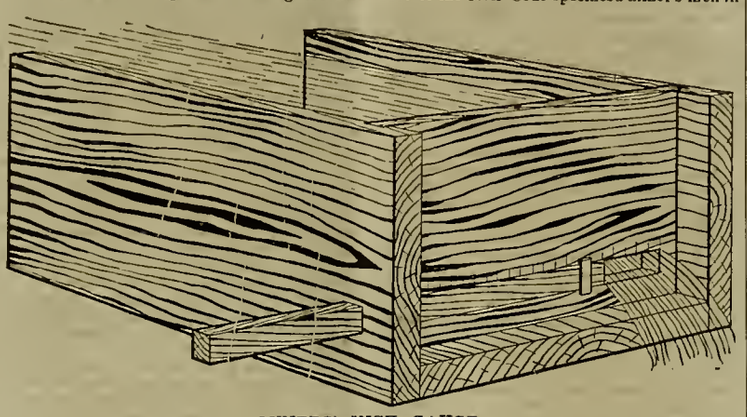
Surface and Underground Men.

In the working of mines the proportion of workers above and underground influences in a marked degree the cost of production. In many mines in this country we have far too many people connected with the mine on the surface—that is, they are disproportionate to the underground hands. The latter are the real developers, though those above, of course, assist the others in removing and handling material. A great deal depends on the way the works are laid out. If everything on the surface is properly arranged for handling ore and waste, fewer hands need be employed than when the work has to be done by "main strength and awkwardness." We have no statistics to tell the proportion of underground and surface labor in the precious metal mines of this country. Some interesting statistics recently published concerning the coal mines in France throw some light on the subject in connection with collieries.

The labor of the surface hands is in a sense non-productive. It deals only with the disposal of the produce of the underground labor. Like the relative efficiency of the miners of different localities—that is, the annual output per man employed underground—the relative proportion of the labor of a colliery performed at surface is indicative of the degree of economy attained, or at least of the relative cost of production in the different localities compared. From this point of view the following figures are instructive. They show the proportion of underground hands to surface hands in each of the departments mentioned: Pas-de-Calais, 1 to 0.27; Nord, 1 to 0.28; Puy-de-Dome, 1 to 0.31; Isere, 1 to 0.38; Bouches-du-Rhone, 1 to 0.44; Loire, 1 to 0.46; Saone-et-Loire, 1 to 0.47; Gard, 1 to 0.50; Haute-Saone, 1 to 0.51; Haute-Loire, 1 to 0.52; Allier, 1 to 0.52; Nievre, 1 to 0.54; Tarn, 1 to 0.55; Aveyron, 1 to 0.66; Herault, 1 to 0.70; Creuse, 1 to 0.83. The average is 1 to 0.40. Nearly one-half of the total number of colliery hands are to be found in the two first-named departments, where the proportion is lowest. Of the surface hands, the proportion of men to women, is 1 to 0.15; of men to children between the ages of 12 and 16, 1 to 0.10; and of men to women and children, 1 to 0.25. Underground the proportion of men to children is 1 to 0.071.

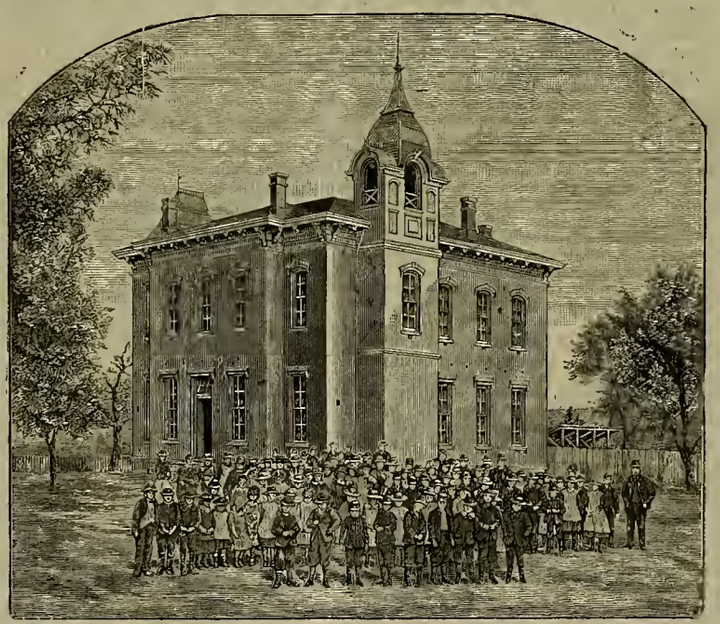
A Miner's Inch Gauge.

We give herewith a rough sketch of a miner's inch gauge, which any one can make for himself. The term miner's inch is more or less indefinite because California water companies do not all use the same kind of gauge. Section 1415 of the Civil Code specifies a miner's inch in this State as that quantity of water which will flow through an opening of one square inch in the bottom or side of a vessel, under a pressure of four inches above the opening. Fifty of these miner's inches are equal to a discharge of one cubic foot of water per second, and is less by .312 of a cubic foot than the Nevada county miner's inch.



MINERS' INCH GAUGE.

The generally accepted inch of water is that which is equal to 17,000 gallons of water every 24 hours, or about 100 pounds per minute; and this amount will flow through every square inch of opening in a gauge under a pressure of six inches above the center of the opening. With a gauge such as is shown in the cut, the 6-inch head can be obtained by opening or closing the slide, and the number of square inches remaining open indicates the amount of water passing through in miner's inches.



PUBLIC SCHOOLHOUSE AT REDDING, SHASTA COUNTY, CAL.

THE Alvarado Beet Sugar Factory of California, says an Eastern exchange, was kept in operation from August, 1884, to April, 1885—eight months. During that time it made 3,000,000 pounds of sugar. Sorghum factories in this country have not yet accomplished so much. There must be some virtues in the soil and climate of the Pacific Coast lands which we lack in the valley of the Mississippi or on the Atlantic slopes, for we cannot issue reports so hopeful.

THE public offices of London are guarded against dynamiters by 500 policemen in citizens' clothes.

Purifying the Water Supply of Cities.

One of the most important of subjects to the dweller in a large city is that of the purity of the water supply. While the water companies which furnish it are supposed to exercise great care in the matter of selling pure water, they are not always as careful as the consumers would desire. Even when free from animalcule or vegetable growth, there is often a flatness about the water which renders it unpalatable, more aeration seemingly being needed. In some places the water is aerated by fountains being formed in the reservoirs, but in most cases this aeration is entirely neglected. A new idea has lately been developed in Philadelphia, the water department of that city having, after considerable investigation, adopted a plan which has greatly improved the quality of the water, and put an end to the general complaint against its impurities. The problem has been solved by Prof. Albert R. Leeds, who after much careful study and persistent experimenting has hit upon a most ingenious, yet simply efficient and economical plan for purifying the water supply of cities, towns and villages, by the introduction of air under pressure into the water, likewise under pressure and motion.

The practicability of the system has been fully demonstrated at Hoboken, where the first experiments were made leading to its final adoption by the water works of that city, where it is now in successful operation. The system has also been thoroughly tested in Philadelphia, and the results have proved so satisfactory that the water department of that city has made arrangements for introducing the improvement on an extensive scale at its several pumping stations. The contract for building and furnishing the several air-compressing engines required for this purpose has been awarded to the Ingersoll Rock Drill Company of New York, their "straight line" single air-compressor having been selected by their engineers as the best suited for this kind of work. Three of these have already been delivered and the others will follow at an early date.

This system, which may be aptly called the "aerating process," is equally adapted for the purification of stagnant water in lakes, ponds, reservoirs, tanks, etc., so that its general adoption wherever foul and impure water exists, is much to be desired, and will be hailed as a blessing by all those communities who suffer from drinking impure or stale water, no less than from breathing the pestilential emanations of stagnant lakes and ponds.

In view of the vast importance of the subject and the daily growing necessity for such relief as this system offers, the parties owning and controlling the patents have organized into a permanent company, called the United States Pure Water Supply Company, for the purpose of properly introducing the system wherever it may be need. The company's headquarters for the present are at No. 10 Park place, New York.

THE ENGLISH COAL FIELDS.—The decadence of the English coal fields is often made a matter of discussion on both sides of the Atlantic. The latest instance is a pamphlet just issued in Liverpool entitled "Warning from the British Coal Fields," in which the author advocates the formation of a national association for the purpose of inquiring into probability of their early exhaustion. He is of the opinion that at the present rate of working, British coal will come to an end in 110 years.

An English journal, in reply, reminds the author that a royal commission of undoubted capability for the investigation, has looked into the whole matter and made a report in 1871, which gave nearly 450 years for the duration of the coal to the depth of 4,000 feet. In the zone exceeding that limit a quantity of coal which amounts to 48,465,000,000 tons is believed to exist. That report was based upon the most careful and trustworthy information obtainable.

REPEATING MATCHES.—The Russian Government has awarded a patent to the inventor of a means of so impregnating wood with a certain chemical that, when dried, the matches made from this prepared wood can be used several times over, thus effecting a saving of, it is claimed, at least 75 per cent.

A TAX of $5,000 a year has been placed by the Town Council of Wrightsville, Ga., on the sale of Jamaica ginger, the same that is laid on spirituous liquors.

Who Own the Vast Lumber Interests on Puget Sound.

In the western part of Washington Territory, says the Portland *Journal of Commerce*, and between the Cascade range on the east and Coast, or Olympic range, on the west, and between the 47th and 49th degrees of north latitude, is a thickly timbered belt of fir, cedar, alder, maple and other woods. Of these fir probably represents three-fourths. In the midst of this wealth of forest nature has placed a broad deep arm of the Pacific ocean—Puget sound—with which it is connected by the strait of Fuca. Thus not only has nature provided the timber, but the water-way also, by which it is possible for the merchant marine of the world to come and obtain their lumber supplies, much of which some time in the future must be furnished from these forests. Already the lumber trade with Australia, Central and South America, China and the islands of the Pacific amounts to fully 75,000,000 feet a year, and employs a fleet of about fifteen vessels every month.

Puget Sound is 200 miles long, and has a shore line of 1,800 miles. This irregular shore line forms innumerable harbors splendidly adapted for the erection of saw-mills and other wood-working factories, and also for the establishment of ship yards. Along this whole shore line, and from thence on both sides as far as the eye reaches, nothing can be seen but the vast and magnificent wealth of timber, save here and there where man has established a mill port, a town, or an occasional farm.

In the timber belt of western Washington there are 20,000,000 acres covered with timber, most of which is included within the limits named—an area nearly equal to the combined areas of the States of Connecticut, Massachusetts, Vermont, and New Hampshire. This timber belt will average 25,000 feet of lumber to the acre, or a total of 500,000,000,000 feet of lumber. Hence the saw-mills of Puget Sound, with their present capacity of 500,000,000 feet per year, would take 1,000 years to cut it down. The fir trees frequently attain the hight of 250 feet, and planks of lumber are sometimes turned out of these mills 100 feet in length.

Present Investments.

To show what has already been done by way of investment in saw-mills and timber lands, we give the following table:

Name and Location of Mill.	No. Mills.	Daily Cut.	Value Mill Property.
Puget Mill Co., Pt. Gamble, Pt. Ludlow and Utsalady	3	300,000	$3,000,000
Port Blakely Mill Co., Port Blakely	1	1,000,000	1,000,000
Washington Mill Co., Seabeck	1	125,000	500,000
Tacoma Mill Co., Tacoma	1	175,000	500,000
Port Madison Mill Co., Port Madison	1	80,000	300,000
Moore & Smith, Port Discovery	1	80,000	300,000
Stetson & Post, Seattle	2	50,000	200,000
Bellingham Mills, Bellingham	1	50,000	75,000
Milton Mill Co., Milton, opposite Seattle	1	40,000	70,000
Port Townsend Mill Co., Port Townsend	1	35,000	50,000
Washington Colony Mill, Whatcom	1	20,000	50,000
Seattle Lumber and Commercial Co., Seattle	1	20,000	50,000
Smith & Hatch, Tacoma	1	30,000	50,000
Seattle Mill Co., Seattle	1	15,000	40,000
Ostrander & Co., Seattle	1	30,000	40,000
Yesler Mill Co., Seattle	1	40,000	40,000
Michigan Mill Co., Seattle	1	25,000	40,000
Blackman Bros., Snohomish River	1	20,000	20,000
Lake Washington Mill Co., Seattle	1	10,000	10,000
Total	24	1,300,000	$5,330,000

It is possible, says the journal from which we quote, that a few mills may have been omitted.

The Lumber Fleet.

In addition to the foregoing statement of the wealth of the mill corporations, very many of them also own sailing vessels and steamers, which are engaged in carrying lumber from the various mill ports to San Francisco and foreign ports. Many of these corporations have agencies in San Francisco, where they own properties in the shape of lumber yards. The following list of sailing vessels and tugs owned by the mills is believed to be correct:

	Sailing vessels.	Tugs.
Puget Mill Co	10	4
Tacoma Mill Co	5	1
Port Blakely Mill Co	4	2
Washington Mill Co	2	2
Port Madison Mill Co	5	1
Stetson & Post	..	1
Moore & Smith	..	.
Total	26	11

The Stetson & Post Milling Co. is particularly spoken of by the *Journal* as being very strong, financially, and destined to become a very wealthy one, though not at present as large as many others. This company, located at Seattle, was organized about 1876, 10 years ago, by George W. Stetson and J. J. Post, who perhaps then had $1,000 between them. From this small beginning, they have grown until now, with the addition of L. W. and A. E. Stetson, they have recently incorporated under the name of "Stetson & Post Mill Company," having a paid-up capital of $200,000. This company owns two mills, located at Seattle—one a saw-mill and the other a sash and door factory. The land on which these mills are located is very valuable, as it consists of water front properties covering several acres.

The Detroit Copper Mines.

From an article in the *Deming Tribune* we take the following: The Detroit Copper Mining Co. was organized three years ago by E. B. Ward and others, of Detroit, and it gets its name from its originators. At present it belongs to Phelps, Dodge & Co., of New York, and Mr. Church, the latter gentleman being the manager of the property.

It is reached by the narrow gauge road which we have mentioned, via the incline of the Longfellow mine and then by a road owned jointly with the Arizona Copper Company, one and a half miles in length. This road gives direct rail communication from all its mines that are being worked with the smelters, so that the ores are handled very cheaply.

The furnace was at first located down at the river, the ore being hauled by wagons seven miles. Nine months since pumping works were put in at the river, consisting of two Worthington pumps having six-inch plungers and twelve inch stroke, utilizing the water power there to operate them. The water is forced six miles and is elevated 1,500 feet and 100,000 gallons per day can be delivered in the tanks at the mines. The two tanks have a capacity of 160,000 gallons. It is claimed there is no pumping plant in the country which equals it both as to distance and elevation.

The smelter is admirably located, easy of access from the mines, the cars being unloaded directly into the crushers, from which it goes to the bins below. Instead of weighing the charges individually, the ore is bedded in large bins opening on the charging floore so there is nothing for the wheelers to do but shovel it indiscriminately into the barrows. Mr. Church thinks it is the preferable method of preparing the charges and that it relieves the feeders from much responsibility. The coke bins are adjoining, so that neither ore nor fuel has to be moved more than 20 to 30 feet for delivery at the furnace doors. The dumping room for slag is equally close to the furnaces below, and there is unlimited room, as the mountain side slopes abruptly and to several hundred feet in depth. By the arrangements spoken of the labor required is reduced to the minimum.

A concentrator having a capacity of fifty tons per day is being erected with a view to utilizing the very large quantities of fine screenings, which are mixed with too much waste to allow smelting in their present form. Cullom jigs are to be used, and from experiments made it is believed there will be no doubt about the success of the undertaking.

The mines owned by the company are the Yankee, the Montezuma, Copper Mountain and Arizona Central.

Production.

Although much time has been lost since the mines were put in operation, owing to the time consumed in removal from the river, and more particularly by the loss of teams, etc., inflicted during the Indian raid two or three years ago, the mines had recorded a production up to May 1st of 8,500,000 pounds, and are now producing about 300,000 pounds per month. The capacity, if the two furnaces were in blast, would be about 150 tons daily, but at present only the smaller furnace is in operation.

The property is an exceedingly valuable one, and is evidently managed with excellent judgment and economically. There is no stock for sale, and there is not the slightest desire for notoriety.

BLUE RIVER MINES.—Last Thursday two wagon loads of Chinamen left Eugene for Blue river, a tributary of the McKenzie, to mine gold. Charles B. Cole took one load with Hickson's team, and a man residing on the McKenzie at the mouth of the Blue, whose name we did not learn, took the other lode. Twenty Chinamen went up in this gang, and it is reported that a few more will soon join them. Some mining was done on Blue river years ago, and gold exists along the stream in sufficient quantities to pay small wages. If the Chinamen will only turn their attention to mining, in such places as this, they will not interfere with our own people, and whatever they dig out of the ground and expend for provisions and supplies, will be just so much gained to the community. Friday morning Henry Hill started up for the Blue river mines with a wagon load of tools and provisions for the Chinamen.—*Oregon State Journal.*

THE Betty O'Neil mine at Lewis, Nev., has closed down indefinitely, owing to some trouble with the Miners' Union in regard to the wages paid the miners employed by its owner.

OWING to scarcity of water, the Klamath Quartz Mining Company's mill at Salmon river was shut down last week. The last clean-up realized something over running expenses.

Experts and Prospectors.

The *Miner* man happened to run across a would-be expert of a few months' experience in this country, the other day, who had collected together a few specimens of ore during his rambles, which he had been showing to different parties, asking them what it contained. Some told him that it carried a large per cent of silver, and was worth several hundred dollars to the ton. The self-styled expert, not feeling satisfied, asked his friends how long they had been in the country. Their reply was, something less than a year. Another party was asked as to what he thought of the ore. After turning the piece around, and examining it on all sides, he replied, "Well, I should say it was pretty good-looking ore, and will run awey up." How long have you been in the country?" asked the expert. The man replied, about one year. Finally, an old prospector was accosted as to his opinion. His reply was, "My friend, are you what is considered a mining expert?" He answered, "I am." "Well," says the prospector "have you ever had any practical experience in mining?" "No, sir." "Well, it seems you claim to know how to work a mine. Where did you get your experience?" "Why, sir," he said, "my knowledge was obtained from books." "Well, my friend," says the prospector, "a theoretical experience won't do without a practical knowledge. With a practical experience of some years, together with your theoretical knowledge, you may in time acquire sufficient knowledge how to systematically work a mine, and not till then." "How long have you been in the country?" asked the expert. The prospector's reply was, "about 20 years." "Well," says the expert, "you haven't given me your opinion of this piece of ore." "Well, sir, take it to an assayer, have him assay it and he will tell you more about it than any other man you will meet. While some may think they know all about it, yet you will find that the most reliable man is the assayer." Mr. Expert left the next day for the East, a wiser man. This incident illustrates thoroughly the different stages through which a person has to pass before he has the conceit taken out of him. We find in most all our mining camps, men who know more, in their own estimation, with a few months' experience, than men who have made mining a study for years. How many so-called experts are sent to this country from the East every year? A practical miner's advice on a mine is far preferable. When Eastern capitalists are made to see this matter in its proper light, there will be fewer failures in mining.—*Colorado Miner.*

PURCHASING UTAH ORES.—There exists a slight breeze of competition between the ore buyers of Salt Lake. Up to within the past few months this market was pretty much controlled by inside buyers, but since that time Mr. F. H. Shepherd, with the Pueblo Smelting and Refining Company, and Mr. McKinney, representing the Kansas City Smelting and Refining Company, have been working on the outside, purchasing nearly all the odd lots of ore not contracted for by the year. A gentleman who has sold some ore, in speaking to a reporter, said that Mr. Shepherd was for some time in this city before any one learned his purpose. He was known, from his reticent, quiet manner, as the "Unknown," but a few weeks ago he made some heavy purchases of ore, paying on the outside a trifle better figure than had been offered by other buyers. This has led to a bit of rivalship whereby the man giving the highest bid gets the purchase. Mr. Hanauer handles Ontario and several ores for his own use and shipment to Omaha and Denver. T. R. Jones purchases entirely for the Germania smelters, seven miles south. Scott & Anderson supply the Mingo at Sandy, which, with Shepherd and McKinney, constitute the regular buyers of Utah, Wood River, and Nevada ores. The Brooklyn and Yosemite ores, from Bingham, are not under contract, and are bought in odd lots. Most of the best mines, including the Crescent, Ontario and Daly, of Park City, the Bullion and Eureka, of Tintic, and several others, are under contract up to July 1st, and some to October of this year, but after these dates some rivalry may be expected in the purchase of their ores.—*Salt Lake Democrat.*

MINT STATISTICS.—Among the tables in the special report of the Director of the Mint on the production of gold and silver, soon to be published in a statement by years, showing the deposits of domestic gold bullion at the Mint and Assay Offices from July 1, 1873 to January 1, 1885, which amounted to $415,000,000, and also the production as estimated by the Director during the same period, amounting to $428,000,000; total estimation for 11½ years being only $13,000,000 in excess of the deposits of domestic gold during the last fiscal years. The deposits of foreign coin and bullion have exceeded the net imports by over $13,000,000, showing that considerable foreign coin is brought by immigrants upon their persons, and some foreign gold bullion, probably brought by rail, is not reported at the custom houses. Another table shows the gold coinage at United States mints for the last 12 fiscal years, which amounts, after deducting United States gold coins remelted, to $545,106,114.

The Mining Outlook in Oregon.

Many circumstances point to an important extension of mining enterprise in Oregon and Washington in the near future. All the old and paying mines are being worked diligently, and hardly a week passes without a mineral discovery in some part of the country. From western, southern and eastern Oregon, and from several points in eastern Washington, reports of rich discoveries have come within the past month. The country, it seems, is being more thoroughly prospected than ever before. The dullness in general business has turned the attention of many men to mining, and in all directions the mountains are being searched for the precious deposits which it is certain lie hidden in their depths.

In the hopeful estimate of the business prospect recently put forth by the *Oregonian*, no account was made in the benefits likely to come to the country from this branch of industry (for simply as an industry mining must hereafter be followed), but it, too, might have been added as an important item. The output of our mines now operated will largely exceed that of any recent year, and there is reason to hope for a further large increase through the opening of entirely new fields.

It is by no means certain that the reduction works, so much talked about, will be established. Enough money to build and fully equip such works has been pledged, but the railroad companies have withdrawn the rates for bullion which they offered when the scheme was proposed, and under the rates now given there is no assurance of profit. The whole matter rests with the railroad companies, and it is certainly to be hoped that they will find a way to make sufficient low rates. The existence of works here would make Portland a mining center and stimulate the increase of mining enterprise throughout the country.—*Oregonian.*

THE GOLD MILL.—The Camae No. 2 mill is being visited daily by mining and mill men, all of whom agree that it is working smoothly and seems to be doing good work. Yesterday afternoon the amalgam on the silvered plates was scraped off, and between four and five pounds taken up; but it is, of course, impossible to estimate its value, as it has not been tested. The ore carries from four to six ounces of silver and one to two ounces of gold per ton, but the proportion of each metal saved is not known. The assay furnace was to be completed to-day, and to-morrow assays will doubtless be made of the amalgam, tailings and battery run. Then a "guess" can be made of the yield per ton. But no until a couple of weekly clean-ups shall have been made can anything like average results be definitely known. The first clean-up will be made next Sunday night or Monday morning, when the first week's run shall be completed.—*Wood River Times.*

GOLD AND SILVER.—Messrs. W. C. Dawes and W. H. Robbins came in from the mines Sunday night last, the former with 1,700 ounces of silver, the latter with 132 ounces of gold. Mr. Dawes took the silver out of Peck mine tailings. Mr. Robbins got his gold out of rock from the Del Pasco and another mine. The gold, which is worth in the neighborhood of $1,848, is the result of seven days' run of the Del Pasco 4-stamp mill. As there is plenty more rock as was crushed, in the mine, Mr. Robbins and his partner, Mr. Gobin, have "a good thing." They may, ere long, add more stamps and put in a concentrator or two.—*Prescott Courier.*

CEMENT MINING.—It has been well known for 30 years to the residents of the East Branch of Feather river, that there was an immense body of gold-bearing cement between Twelve-mile Bar and Rich Bar, some of it paying as much as $3 to the pan. A company has been lately organized in San Francisco to work this cement. The parties claim that they have a process by which they can dissolve it at a cost of 75 cents per ton. If their process is what they claim for it, "there is millions in it," for the cement is rich beyond a doubt. The parties went down from Meadow Valley last Tuesday to commence operations. We wish them success in the undertaking.—*Plumas National.*

RICH ORES.—William Merrill, who has been prospecting about 35 miles due west from Winnemucca, brought in a sack of various kinds of ores yesterday. He has rich chloride and sulphuret silver ores, specimens of almost pure galena, and samples of nickel and cobalt ores. He says there are nine veins carrying galena, three nickel leads, and 14 carrying silver, which crop out in the district, with doubtless many more that do not show themselves on the surface. It is a good place for prospectors, and an inviting field for anybody who desires to build reduction works.—*Silver State.*

THOMAS WILLIAMS took out of his placer mine in Gordon Gulch, White Pine mining district, Kern county, during last winter, 50,000 buckets of gravel, yielding $800 or $1,000. The buckets were hoisted with a windlass at very little expense.

ORO district, 25 miles south of Cherry Creek (gold bearing), White Pine county, Nev., where several parties are now at work, promises in the near future to make such a showing as will attract considerable attention.

Sending Logs Down Nevada Mountains.

One nf the most interesting sights to bo seen in the Sierras is the manuer in which logs aro sent dowu to the valleys or river canyons from the timber hights above. A contemporary gives the following graphic description of one of these scenes as follows:

A cbute is laid from ths river's brink up the steep mountain to tho railroad, and while we are telling it, the monster logs aro rushing, thundering, flying, leaping down tho declivity. They come with the speed of a thunderbolt, and somewhat of its roar. A track of fire and smoke follow them—fire struck by their friction witb the chute logs. They descend the seventeen hundred feet of tho chute in fourteen seconds. Iu doing so, they drop seven hundred feet perpendicularly. They strike the deep water with a report that can be heard a mile distant. Logs fired from a cannon could scarcely havo a greator velocity than they havo at the foot nf the chute. The average velocity is over one hundred feet a second throughout the entire distance, and at the instant they leap from the mouth their speed must be fully two hundred feet per second. A sugar-pine log sometimes weighs ton tons.

What a missile! How the water is dashed into the air! Like a grand plume of diamonds and rainbows, the feathery spray is hurled to tho hight of a hundred feet. It forms tbe grandest fountain ever bebeld. How the waters foam aud seetbe, and lash against the shore! One log having spent its force by its mad plunge into the deep waters, has floated so as to be at right angles with the path of the descending monsters. The mouth of tho chute is, perhaps, 14 feet above the surface of the water. A huge log, hurled from the cbute, cleaves the air and alights on tho floating log. You know how a bullet glauces, but can you imagine a saw-log glancing? The end strikes with a heavy shock, but glides quickly past for a short distance; then a clash like the reverberation of artillery, the falling log springs vertically into the air, and with a curve like a rocket falls into tbe water, a long distance from tbe log it struck.

BOYS AND TRADES.—An exchange believes that the old apprenticeship system is in the main responsible for the aversion that such a large number of boys manifest for learning trades. For the first year under that system a boy in a blacksmith shop, for instance, is put to the roughest and most disagreeable work. He is made to do a thousand-and-one things that will be no use to him when he grows up, and bave nothing to do with making him a skillful mechanic. He knows tbis and naturally rebels and wants to do something that will be of benefit to him. He is brought up to feel that to be a good blacksmith a man requires much brawn and little brains. That he obtains an erroneous idea of the trade he is trying to learn we all know, but nevertheless this impression is apt to become fixed in his mind from tbe character of tbe work he is put to do. Is it any wonder that be looks with envy on the boy behind a counter or in a lawyer's office, and longs to get away from an employment which has become irksome?

THE COOPER UNION, NEW YORK.—This free institution is doing a good work in educating and improving the young people of that city. An abstract of the last annual report shows that during the year thsre were 4,208 pupils in its schools. Of this number 531 attended the Industrial Art Classes for Young Women in the day time. More than 650,000 persons bave used tho reading room during the year, and nearly 200,000 books have been lent to readers to take to their homes. Tbe evening art schools are largely attented, and there are aleo scientific classes wbich pursue a regular course of study extending over a period of five years Thanks to tbe benefaction of its founder, the Cooper Union appears to be doing a larger share of this kind of educational work than any other institution in the country. Such an institution is needed in every large city in the Union.

THE NEW LABOR BUREAU.—Secretary Lamar has appointed seventeen gentlemen in as many different States as special agents for the new Bureau of Labor. All the appointments thus far are in States east of ths Mississippi State, except one for Missouri. It is to he presumed that an agent will be eventually appointed for each State. It is said that in the appointments thus far made the Secretary has acted without regard to political affiliation of the persons appointed, and moreover that they have been selected without regard to any known theories as to labor and industry wbich they may heretofore have entertained. Each man is expected to give his best tbought and judgment to the matter. The appointees thus far represent all the various shades of political opinion, and also etand upon all sides of the tariff question.

LOW RATES OF INTEREST.—The State of Connecticut has recently issued almost $2,000,000 in bonde, which were sold at nearly one-quarter of one per cent *above* par. They are not redeemable until 1910, and hear but three per cent intereet. This transaction shows at what a low price money can be borrowed when the eecurity ie undoubted.

USEFUL INFORMATION.

A New and Useful Paint.

"Ulscote" is tho name of a new and what ie claimed to be a very useful paint. Tbe word, at least, has a powerful signification for good, as it signifies a "preserver of matter." It is said that this new pigment possesses wonderful preservative qualities, and gives to any surface of wood or metal to which it is applied a metallic coating, which most effectually resists the action of the elements, as well as the salt air, so destructive to paints along the sea coast. Its density is so great tbat it possesses covering powers in excess of any other pigments. They say 38½ lbs. will cover ae much surface as 100 lbs. of lead witb the same amount of oil. Tho natural color is a grayish blue, and from this as a base can be made all the popular dark colors and shades for house, iron, bridge or other painting.

From this pigment is also made a marine paint, which not only protects iron or wood from barnacles or fouling, but effectively resists the action of tbe "teredo," so destructive to wooden vessels, piers, etc. As an illustration of this, a piece of wood is shown which was coated with "Ulesote," and attached to a piece of unprepared timber, both of which were submerged in water for a period of about three and a half months, during May, June, July and August. The two pieces attached were sawed in the center, when it was found that the paint had resisted the attack of the formidable pest completely, while the piece of timber to which it was attached was completely honey-combed.

There is also shown a piece of sheet-iron, which, after being painted on one side with "Ulesote," was submerged for a period of about six months in salt water. The painted side shows the iron to be perfectly protected both from rust and fouling, whereas the unpainted side is thickly coated with rust and scale. The great density and covering properties of this paint are such that one pound of the "Ulesote" paste and one pound of linseed oil will give a priming coat to over 100 square feet of dry-planed boards.

Baseballs and Their Manufacture.

Very few persons are aware either of the extent of the business of baseball manufacture or of the processes involved in that industry. It is estimated that fully ten millions of baseballs are manufactured and sold in this country every year. The most expert workmen are employed, and the process, as described by a cotemporary, is as follows:

First, there is a little hard rubber ball, and around that tbe wrapper winds a strong, blue, coarse yarn. When this reaches a prescribed size it is firmly wrapped with ths white Venetian yarn.

The balls are then placed in an oven and baked until all the moisture is taken out of them and they are reduced in size. This makes them solid. After this they are coated with cement. This causes the balls to retain their shape and they cannot be knocked crooked. Then comes some fine blue yarn, and around the whole is placed fine white gilling twine. The balls are weigbed, for each must be of certain weight, and are now ready for the covers. These latter are made of tbe best quality of horse hide. The cover consists of two pieces, each cut in the shape of the figure "8." By bending one section one way and tbe other in an opposite direction a complete cover is obtained.

For years balls were covered with four pieces of leather, and at one time two covers were placed upon a ball; that is, the ball was half made when it was covered, and then another ball constructed over it. But even that did not prevent its being knocked out of shape. They cannot disturb tbe ball as now made because tbe cement holds it.

A little machine owned by a Philadelphia firm is used for winding the balls. It wraps two and a half ounces of the American Association balls in a minute, and the rest is finished by hand. That apparatus is a little wonder. It does its work as neatly as if it had brains, but is capable, say its owners, of a good deal of improvement.

SECOND-HAND BARRELS.—The second-hand barrel business has become quite an extensive industry in New England. Boston is the center of the business. Flour barrels take the lead. Tbey are collected of grocers and consumers of flour all over New England, and are put to a great variety of uses. A small proportion are used again hy millers; the sugar houses use quite a large number; also fertilizer manufacturers, and the miscellaneous demands are legion. A largs number are ordinarily shipped to Norfolk, Va., each year and used for packing the vast quantity of "garden truck," whicb is sent to Northern markets. Flour barrels as they are "picked up," from the etores and bakeries, within "carting distance" of Boston are worth to-day 12 to 14 cents; when "trimmed," 17 to 22 cents. Nsw flour barrels cost to make from 32 to 35 cents each, and in most cases would be no better for ths uses to which tbe great bulk of second hand flour barrels are put.

The businese in oil barrels in Boston is one which has grown from comparatively nothing a few years ago, to quite a sizable business today, ths petroleum industry being the largest "consumer." Oil barrels are made of well-seasoned white oak staves and heads, with iron hoops and the first use, to which the greater number of new oil barrels made are put, is to hold petroleum. New oil barrels cost from $1.15 to $1.20 in Titusville, Pa., and about $1.30 in New York, while in Boston very few new oil barrels are used. Second-hand kerosene barrels are worth $1 to $1.12, lubricating oil barrels, 65 to 75 cents, tanners and curriers fish oil barrels 60 to 70 cents; these prices for large second-hand barrels in good order, delivered in Boston.

Second-hand whisky barrels are quotable at 65 and 70 cents.

EMBOSSED LEATHER.—Hundrede of men, women, and even boys, in New York, says ths Brooklyn *Eagle*, are engaged in the "business" of collecting old boots and shoes, which they take to the wall-paper factories, where they receive from 5 to 15 cents per pair. Calfskin boots bring the best price, while cowhide ones are not taken at auy figure. These boots and shoes are first soaked in several waters to get the dirt off, and then the nails and threads are removed and the leather is ground up into a fine pulp. Then it is pressed upon a ground of heavy paper, which is to be used in the manufacture of "embossed leather." Fashiouable people think they are going away back to mediæval times when they have the walls of their libraries and dining-rooms covered with this, and remain in blissful ignorance that the shoes and boots which their neighbors tbrew in the ash-barrel a month before now adorn their walls and hang on the screens which protect their eyes from the fire. Carriage-top makers and bookbinders also buy old boots and shoes, the former to make leather tops for carriages and the latter leather bindings for the cheaper grade of books. The new styles of leather frames with leather mats in them are entirely made of the cast-off covering of our feet.

PECULIARITIES OF ANIMALS.—All ruminating hoofed beasts have horns and cloven feet. If the hoofs are even tbe horns are even; if odd, as in the rhinoceros, the horns are odd, that is single or two placed one behind the other. Creatures with feathers always have beake. Pigeons with short beaks have small feet. Tbe long limbs of the houud are associated with a long bead.

GOOD HEALTH.

When Your Girth Increases.

There is that occasional visit to tbe tailor, who, tape in band, announces in commercial monotone to the listening clerk the various measuremeuts of our girth, and congratulates us on the gradual increase thereof. He never in his life saw you looking so well, and "fancy, sir, you are another inch below your armpits," —a good deal below—"since last year!" insiduously ineinuating that in another year or so you will have nearly as fine a chest as Heenan! And you, poor, deluded victim, are more than half willing to believe that your increasing size is an equivalent to increasing health and strengtb, especially as your wife emphatically takes that view, and regards your augmenting portliness with approval. Ten years have now passed away since you were 40, and by weight 12½ etone—a fair proportion for your height and build. Now you turn the scale to 1 stone more, every ounce of which is fat—extra weight to be carried through all the labors of life. If you coutinue your present dietary and habite and live five or seven years more the burden of fat will be doubled, and that insinuating tailor will be still congratulating you. Meantime you are "running the race of life"—a figure of speech less appropriate to you at the present moment than it formerly was—handicapped by weight which makes active movement difficult, upstair ascents troublesome, respiration thick and panting. Not one man in 50 lives to a good old age in this condition. Ths typical man of 80 or 90 years, still retaining a respectable amount of energy of body and mind, is lean and spare and lives on slender rations. Neither your heart nor your lunge can act easily or healthily, being oppressed by the gradually gathering fat around. And this because you continue to eat and drink as you did, when youth and activity disposed of that moiety of food which was consumed over and above what the body required for sustenance. Such is the import of that balance of unexpended ailment which your tailor and your foolish friends admire, and the gradual disappearance of which, should you recover your senses and diminish it, they will still deplore, balf frightening you back to your old habits again by saying: "You are growing thin; what can be the matter with you?" Insane and mischievous delusiou.—*Nineteenth Century*.

AMOUNT OF EXERCISE REQUIRED.—Dr. Parkes has calculated that the amount of exercise a man in health sbould take regularly is equal to walking nine miles a day upon level ground. The amount of walking done in walking about the house and other domestic duties may probably be put down as three miles, which will leave only a walk of six miles per diem on level ground. If the ground ie hilly, this will be still more reduced, eo that it certainly doee not seem an excessive amount to advise. The proper quantity muet, however, vary greatly with circumstauces. Females, for exampls, will not take as much ae men. In winter more may be tsken than in summer. In youth, when the body is undergoing its most active development, care must be taken that every muscle is exercised in turn. Hence, the free use of gymnastics, games aud sports at this ags is most beneficial. In advanced life ths power aud inclination fur exercise both fail, but sven then every effort should be made to prevail upon the individual to take some amount of exercise, and to postpone the evil day when he will become completely bed-ridden. Such an amount of exercise is in all cases necessary as will keep the muscles in good health, and enable them to meet the physical requirements of the rest of ths body.

Helenina—A New Antiseptic.

Ths London *Lancet* states that some articles have appeared in recent numbers of the *Boletin Farmaceutico*, of Barcelona, calling attention to a drug which seems to be well known in Spain, but which, not having been prescribed witb due regard to its physiological properties, has disappointed many, and so has fallen into undeserved disrepute. The drug referred to is helenina, the active principle of Inula helenium (elecampane). It was formerly used for itch and herpes. It has now been found to have powerful antiseptic properties. Dr. Korah found that 50 centigrammee were sufficient to entirely arrest putrefaction in fivs liters of urine —*i. e.*, one in 10,000 parts. A slice of veal sprinkled with a solution of 25 centigrammes of helenina in two grammee of alcobol, and kept at a temperature of 28° C., remained perfectly sweet for ten days, by which time it was completely dried up.

Au egg beaten up with 300 grammes of water, to which was added 30 centigrammes (about five grains) of helenina dissolved in two grammes of alcohol, remained unchanged at the temperature of 28° C. for six days. Another egg similarly beaten up without the drug, and kept at the temperature mentioned, rapidly decomposed, and in 20 hours emitted a strong odor of sulphide of hydrogen; to this a solution of 50 centigrammes of helenina was added, and in a few minutes the offensive odor had disappeared, and the mixture underwent no further change. Similar experiments with urine, meat and beaten up eggs were made with carbolic acid, boracic acid, and salicylic acid, instead of of helenina; but much larger proportions of these substances were required to prevent putrefaction, and none of them were capable of arresting commencing putrefaction of the egg, as helenina had done.

Korab found that a few drops of a solution of helenina immediately killed the organisms in ordinary infusions, and also in cultivations of the tubercle bacillus. While the writer was working with helenina in his laboratory, he noticed that the bad odors usually present in the vicinity were replaced by the aromatic smell of the drug, due to the washings thrown away. He also noticed that insects, which were commonly very numerous, were at that time absent; even tbe mosquitoes were kept from the whole house during the months in which they specially abouud. Ths drug has proved most valuable in surgery as an antiseptic when carbolic acid and other agents had failed. It has been successfully given internally iu malarial fevers, tubercular, infantile, and catarrhal diarrhœa; and it is expected to prove an excellent substitute for carbolic acid in the Listerian system of aseptic surgery. The dose is about a third of a grain in pill or mucilage, and the price about a penny a grain.

Some New Corn Cures.

The London *Chemist and Druggist* notices some new corn cures substantially as follows:

Salicylic plaster has recently been put on the market as a cure for corns, bunions and thickened skins generally, which some may prefer to make for themselves. This any chemist can easily do. Dissolve two drachms each of salicylic and common yellow resin in six drachms of sulphuric ether, and paint the solution over heliadonna or opium plaster spread on swans'-down. The pigment dries almost instantaneously, and the plaster is then ready for cutting up into suitable sizes for corns. The whole does not cost more than three or four shillings per yard, and several thousand plasters may be made out of that quantity.

Some corns are so painful that neither paint nor plaster can be endured, something of the nature of a shield alone giving relief. For such cases the following wrinkle may be appreciated: Take a corn shield, enlarge the diameter of the hole to a small extent by means of a knife or scissors, and apply in the usual way. Then place in tbe hollow thus formed over the corn a small quantity of any of the following solutions: Salicylic acid and ext. Cannabis ind. dissolved in ether, or ext. Cannabis indica one-half drachm, dissolved in two drachms of liquor potassæ, or a saturated solution of iodine or iodide of potash in strong alcohol. Tbe shield does the double service of taking the pressure of the boot off the corn, and at the same time preventing the liquid being rubbed off by the sock, while all of these solutions penetrate the skin much more rapidly than the ueual collodion prepsration, and are consequently much more effective in their operation. The eaturated solution of iodine often succeeds in removing corns and indurated epidermis when other remedies have failed, and the well known eolvent acton of liquor potassæ is a sufficient credential to induce for it at least a trial.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PACIFIC.—*Ledger*, June 20: Reports reach us to the effect that last Friday the richest rock yet encountered in this famous mine was struck in the 1,500-foot level. It is the intention to run the works to their utmost capacity for several weeks to come, so as to get a supply of about 600 tons of ore on the dump—and then shut down active mining for a month, so as to enable a thorough repair of the works to be made. It is expected to get sufficient ore ahead to run the mill steadily during the period of suspension.

MOORE.—Amador *Sentinel*, June 17: The hoisting works at the Moore mine are now in running order, and the lowering of the water commenced to-day. Messrs. Thomas and Varnum, mining men of San Francisco, have been looking at the Kennedy mine during the week, and we understand that there is some prospect that the mine will be again started. We understand that Warren Rose will shortly assume the superintendency of the Mammoth and Moore mines. Mr. Rose is a mining superintendent of extensive experience and energy, and his selection will no doubt prove a profitable one. The Green Aden mine of Plymouth is exciting considerable interest just now. Hayward is said to be desirous of purchasing it, and an English company is reported to have offered $20,000 for the property. Should the latter get it we understand that active operations will be at once commenced. Of course the owners desire to sell to the highest bidder.

MISCELLANEOUS.—The El Dorado mine of Amador City, owned by Dr. T. H. Mayon, has been started up again. The shaft is sunk on the ledge, and was between 200 and 300 feet deep when work was suspended, the ore body showed of fair width and quality, with every prospect of developing into a good mine. It is now intended to sink the shaft deeper, and otherwise open out the property. A. Hayward has purchased the Dead Horse mine near Sonora, Tuolumne county, and is having the machinery of the Seaton mine, near Drytown, removed there, for the purpose of at once proceeding with its development. W. A. Nevills has purchased the Roseberry mine at Angels, Calaveras county. He has also secured a one-third interest in the adjoining claim, which has been worked with success for some time past, keeping a 10-stamp mill going. There is a large body of ore, said to yield $10 per ton, the ledge extending to the Roseberry boundary, and evidently running beyond it. Mr. Nevills has secured the services of W. Rose, formerly superintendent of the Zeile, to take charge of the works. Mr. Randall, who has been operating a gravel claim on the land of A. P. Clough near Volcano the past season, is engaged in cleaning up. He has taken out over 90 ounces, and with what still remains to be cleaned up, he expects to realize at least $2,000 as the gross result of the run. The Grass Valley gravel claim near Volcano is said to have taken out $25,000 last year. The general opinion is that the present clean-up will turn out equally well. The balance of the Duncan concentrators for the Amador Queen mill in Hunt's gulch are on the ground. It is expected to have the mill ready to commence crushing some time next week. The St. Julian made a clean-up a few days ago. The yield averaged about $12 per ton. The crushing consisted of average ledge matter, and included none of the rich pockety ore. The mine is now being worked by the stockholder's, the contractors having surrendered it on account of difficulty in controlling the water, and other obstacles. The owners now propose to commence a new tunnel, to tap the rich deposit at a point considerably below the winze which has been sunk in the present tunnel. There are four men employed by the company. Several persons interested in the St. Louis mine, near Pine Grove, came up from San Francisco this week to inspect the property and look into the title. O. C. Hewitt, superintendent of the Keystone, visited the mine with them.

ACTIVITY.—Amador *Dispatch*, June 20: We took a short drive down as far as Middle Bar, on the Mokelumne river, last Sunday, and were much pleased to notice the healthy activity that prevails in mining matters in that vicinity, and the bright prospects that seem to be in store for many of the mine owners. We saw enough to convince us that the future outlook of the mining interests between Jackson and the Bar are very encouraging. We were shown some very rich rock which had just been taken out of the Abe McKinney's mine, and also a number of very rich specimens that had been taken out of the Marlette mine, showing free gold in very large quantities. We found the little 1-stamp mill at the St. Julian industriously pounding away on some very good looking ore, from which the owners expect a liberal yield of the precious metal. We also learn that another very rich strike was made in this mine last Tuesday, and that the ore is of a somewhat different quality from that heretofore taken out, being of an iron base and quite red. This new ore is said to be fully as rich, if not richer, than any that has ever been found in this mine, with the probable exception of a few of the richest specimens. We next visited the Quinn mine, where we found quite a lot of good looking rock on the dump pile, but as the workmen were taking their usual Sabbath rest, and were not at the mine, we were unable to ask any questions as to the supposed richness of the ore. Shortly after leaving this place we came to the mouth of the Mammoth tunnel, where we found everything quiet except the air compressor, which did not seem to have any conscientious scruples about breaking the holy Sabbath, The compressor is run by water-power, and forces air into the great tunnel, which penetrates the hill to the distance of 2,200 feet, and furnishes the motive power for running the famous Burleigh drills which are used in the tunnel. The company are erecting a new assay office at the mouth of the tunnel, and making other improvements of a substantial nature, which indicate that they have abounded confidence in the richness and permanency of the mine. The Casco and Kelly mines are lying idle at present, but it is expected that work will be resumed on them before a great while. The Amador Queen mill is completed and will be started up as soon as the rock breaker and concentrators can be got ready, which will be in a very few days. It is a good substantial looking structure, and if the mine turns out as rich as anticipated it will be one of the best paying mines in the county. There are also a number of other mines being prospected along the route on a limited scale, which give promise of being very valuable when they are fully developed; but the work of development is necessarily proceeding very slowly on account of the owners being men of limited means. We hope, however, to be able to give a good account of them in due time.

Calaveras.

IMPORTANT DISCOVERY.—Cor. Calaveras *Chronicle*, June 20: The recent discovery made near Rich gulch, known as the Black Mammoth, and owned by Severns & Ochoa, of this place, promises to be one of importance, the rock being rich in quality. The many tons of "float" prospect well in the Hornspoon. Samples from the outcropping assay from $20 to $40 per ton. The ledge is 20 feet wide. A lot of the ore is being worked at the Simpson furnace. The ore is heavily charged with iron. The Russell reduction works is running in full blast. The Tustin pulverizer works magically and the work of roasting ore goes on unceasingly.

MORE GOOD ROCK.—The Tiger mine at Rich gulch owned by Mr. C. Schlund of this place, continues to yield number one rock. The shaft is now down 100 feet—some 30 feet below the rich find mentioned a short time since—and a level is now being run. Good milling rock was found all the way down, and some exceedingly rich specimens coming from the depth reached were shown us. From the indications, when the rock from the Tiger is milled, the yield will be astonishing, we predict.

ANGELS CAMP.—Henry B. Potter & Co. have consummated a sale of their mining property in this place formerly known as the Big mine and the Hill mine for the sum of $40,000, as is stated by San Francisco capitalists who intend erecting a 40-stamp mill on the mine. The Bachtele Mining Company, which is composed of Bachtele, W. A. Nevilles and Senator Jones, are going to enlarge their mill in order to place more machinery upon it, the mine giving satisfaction to the owners. The Lane mine is looking well, and the 20-stamp mill is running steady day and night with satisfactory results. It is also stated in Sutter creek that Senator Fair will soon start operations on his mine which has formerly been known as the Crystal mine. Capitalists seem to have their attention drawn this way in order to invest.

Inyo.

LEE DISTRICT REVIVING.—*Reporter*, June 20: We learn that our old friend Jack Wilson, of Darwin, who has interests, with others in the old Lee district, is making some fine developments of rich silver milling ore. He is fully encouraged to believe from the several tons of high grade ore already put out under his supervision, and the fine showing in sight, that old Lee will soon make itself known here and hereabouts; and perhaps convince capital what Inyo county is—that is, a good reliable mining region for practical mining capital to look into; and nobody's say should be taken till it has been investigated. Ore from the new developments is said to run from $200 to $500 per ton in value.

RUSS AND BEVERIDGE.—Bell and Thomas have just received their returns for ore shipped from the Brown Monster mine, which is reported to have been the best ore shipped from that district—Jos. McDermitt and his partners have just received their returns. The result of their last few months' work was about 65 ounces of fine gold. Chas. Hagan, of the same party, also crushed some ore which he took out by himself last winter, and is some $500 or $600 better off by his perseverance where others said they could not succeed.

Mariposa.

MINES AND MILLS.—Mariposa *Gazette*, June 20: Notwithstanding the quartz mining interest of the county, for the past year or two, has been comparatively dead, we are pleased to say that there are at present as many mines and mills in operation as at any time for many years. In the places of several old mines that have suspended or petered out, other new mines and mills have sprung up, and if the truth could be ascertained, nearly as much gold is being taken out and shipped as at any time since the Hite mine suspended. The two companies on Sweetwater, Adams & Carter and Jimmy Ferguson, are new, having sprung into existence within the past year or two. Adams & Carter, who are successors to the Groves Bros., have a ten-stamp mill, and since their purchase have added considerable other machinery to the works, which, altogether, makes a complete outfit for a mine. They own and work the two mines known as the "Harbert" and "Rollins Mines," the latter is said to be producing some excellent ore. This company gives employment to some thirty persons, which includes miners, millhands and for sundry other purposes. Jimmy Ferguson has three separate mines from which he extracts ore, and quite recently a rich bunch of ore was struck which elevated its owner to a high estimate of his worldly wealth. Mr. Ferguson works some eight or ten hands and his eight-stamp mill is said to be very perfect. Its enterprising owner is deserving of success.

HITE'S COVE.—A rich strike is reported from Hite's Cove by Mr. Barley, a miner, who has been residing there for a long time, His latest discovery is from a small vein which he traced to where it crossed the river and entered the mountain on the south side. It is undoubtedly a very rich strike. Mr. John Groves has moved into the Cove with his family, and from other indications, the Hite Cove mine and mills are going to start up again soon under the management of Mr. Hite, himself, who is now the owner of the whole property. This will be the greatest blessing that could happen to that whole section of country and one that will be permanent. The Vanderbilt mine, on Mount Buckingham, owned by Hall & Starr, is, we believe, in readiness to crush rock and turn out the gold. They have been engaged for sometime running a 400 foot tunnel, which is nearly completed. The mill, concentrators and every other requirement necessary to work a mine, is very complete and ready to move when the supply of quartz is to be had. In the same region of country, J. H. Green and H. F. Marsh are opening a new mine which is said to be a rich find. They are sinking on a vein and piling up the ore. At present they are rich in imagination, which we hope will prove all they claim for it. Assays have, we understand, been made, which yielded largely. We shall probably know more about this mine after awhile, for Green & Marsh are practical miners and hard workers, and they can't get rich without somebody knowing of it. In the Hornitos district, the London and Quartz mountain mines are all in motion and are creating a new prosperity in that section. These mines are being worked by some new fangled machinery known as Wiswell's invention and lightning concentrators, saving gold by electricity. What next? The new process has been on trial for some time, but we have not heard any opinion whether the machinery and electric process was a success or not. At the London mine there is a stir of business and excitement, it is said, equal to old times and a grand flourish of prosperity is being had there. Al. Branson, the former owner of the mine, is the big chief, having charge as superintendent of the whole business. In addition to the mine and its responsibility, Branson has a store well supplied with goods which will furnish the laborers at the mines and their families with the necessaries of life, This mine will probably give employment to fifteen or twenty persons. The Quartz mountain mine is about the same character of works as the London, and are using the same kind of machinery. It is currently reported that a fine body of ore has been struck in this mine, and the company or stockholders are very much elated at the prospect. The two last named mines have been in operation but a short time, and the two amounting to twenty stamps ought, to nearly make up for the loss of the Yosemite mill and No. 9 mine which suspended nearly a year ago. In the same neighborhood is the Duncan mine with a five stamp mill which has been in operation a portion of the time for the past year. The mine once had a high reputation and was considered a first-class mine. Jerome B. Brown, we believe is the owner and has it covered with a U. S. patent. He has probably owned and claimed more mines in that neighborhood and done less of profit with them, than any man or miner in that section. The Enterprise mine, near Hornitos, belonging to R. W. Barcroft and a few others, has a fine stamp mill, put on by Mr. Barcroft. Since giving the mine a fair test they have been grinding custom rock, some of which has paid well. We do not know whether it is in operation at present or not. That neighborhood is threaded with quartz veins and it would seem that a custom mill ought to pay well. On the north side of the Merced river, above Coulterville, is the Red Cloud mine, from which most favorable reports have been received of late, It is said they have struck a bonanza in this mine and the ore taken out is fabulously rich with gold. This mine had been lingering along without any remarkable prospect for a long time, when all at once the owners were suddenly crowned with success and made rich. This simply illustrates the fact, that indomitable energy and perseverance is frequently rewarded in mining as well as other enterprises. The Bander mine has undoubtedly experienced a greater outlay of capital than all the mines of the country put together. We are informed that a fine body of ore has been found and is being taken out and placed upon the dump at the mill for crushing. If the same degree of energy and determination to find a rich body of ore in this mine is continued, as in the past, we believe the owner and management will yet be rewarded for their labor and capital invested. In former times the mine paid largely and there appears no reason why it should not pay again.

Nevada.

ACCIDENTAL STRIKE IN QUARTZ.—Nevada *Transcript*, June 20: Warren H. Pierce lives on Bear river near You Bet station, this county. Every winter and spring for several years past he has hydraulicked in a small way on a portion of his ranch through which a small gravel channel extends. Two or three weeks ago the ditch that conveys water to his claim broke, and the water ran off at right angles with it, over the edge of the hill. The water that escaped cut a channel through the soil exposing a decomposed quartz ledge that was never before known to exist there. He has dug a hole in that ledge three or four feet square, and has realized about $1,000. He will sink a shaft this summer and prospect the deposit. Four or five years ago a company erected hoisting works on another ledge in the same neighborhood, but did not meet with success and suspended operations.

MINING PROPERTY BONDED.—*Tidings*, June 19: The Alpha and Golden Gate quartz mines, located about 1,000 feet north of the famous Idaho mine, have been bonded by a San Francisco company through the instrumentality of A. C. Springer, and work on those mines will be commenced about July 1st. The two mines have been consolidated and are reckoned as among the best mining claims in the district. This is a most important mining transaction for this part of the country.

LONE TREE MINE.—Work on the Lone Tree quartz mine is progressing rapidly under the direction of John Townsend, The tunnel has been almost entirely refitted and cleaned out, while several good looking quartz veins have been exposed in the shaft. Mr. Sevenoaks, one of the purchasers of the mine, expresses himself as being entirely satisfied with the affair, and looks forward to a paying mine at no distant day.

Shasta.

HAULING ORE.—Shasta *Democrat*, June 17: Wm. Hiatt is engaged this week hauling ore from his mine near Quartz Hill for Seman's mill near Churntown for crushing. The vein has been struck in the Whitton & Small mine, which shows an excellent quality of rock, "enthoosing" the owners to no little extent. Lem Williams, of Copper City, says the mill at that place is now turning out silver bricks 850 grains fine. This is certainly a very high result from such base ore as the company has to treat. Any one wishing to see fabulously rich deposit of gold quartz in place should visit the Schearer & Rattler mine on Salt creek. A visit to this mine will repay the curious, and the lucky owners will be pleased to show it to any one. On account of scarcity of water the mill on the Brunswick mine in Deadwood district has been closed down, but work developing it continues. The last run of ore averaged $14 a ton. Taking into consideration the size of the ledge, which is large, this mine with a good stamp-mill ought to yield big money.

Sierra.

LOGANVILLE DISTRICT.—*Tribune*, June 20: A light mantle of snow covered the ground Wednesday morning. Charles Qurollo & Co. are cleaning up their mining claim. The bright and shining pieces makes one's eyes water. Castanillo & Co. are running their claim night and day. The Marquerite quartz mine is holding the water at the 200 level. They are expecting Supt. Myers every day, and a principal owner from the East. They intend putting in a new pump. Wm. Swan has been up at the ledge called the Northern Belle; he took out some handsome rock that prospects $40 per ton. S. Stephenson and J. Hutchinson will have their mill running and crushing quartz in a few days.

BIG STRIKE IN QUARTZ.—A rancher named Pearson has struck a rich quartz ledge at St. Charles Hill, a couple of miles below Goodyear's bar, on the Yuba river. A party who was up from there yesterday, says that the rock taken from the ledge is completely lined with gold and that considerable excitement exists in the neighborhood over the find.

NOTES.—There is considerable of a boom in quartz mining at Poker flat. We are informed that prospectors are camped all over the hills in tents and brush houses. Samuel Rey, of Gilroy, and J. Sevenoaks, of San Jose, arrived in Downieville Wednesday, and will spend a few days in looking at quartz mines in this section. The former gentleman mined in this county in '52. Rich quartz has lately been discovered in Reiss ravine and a number of locations have already been made by parties. We are informed that that section is a perfect network of quartz veins, and that many of them will undoubtedly prove rich when they are properly opened out. The Huntington Centrifugal quartz mill, which is being put up on the Lindsay ledge, at Poker flat, will be in order to commence crushing this week. If this mill works satisfactorily the parties will put up another one on the same ledge in a few weeks. The Lindsay mine is very highly spoken of by parties who have seen it, and we look for some good returns from there.

OSCEOLA QUARTZ MINE.—Sierra *Tribune*, June 19: The above named ledge is situated a few hundred yards out of Alleghany, on the north side of Kanaka creek, and is the property of Theodore Smith. The vein is a large one, measuring six or seven feet in many places. Three tunnels have been run in the hill on the ledge. The upper one of the tunnels is in a distance of 30 feet, the second 50 feet the third and lower one about 80 feet. The lower adit taps the vein between 300 and 400 feet below the highest croppings of the ledge. Mr. Smith proposes to push ahead developments on his ledge just as fast as he is able to, and he hopes after awhile to have something to show that will astonish the neighbors. One thing we failed to mention above is the supply of water at hand in Kanaka creek, which could be utilized for mill power. This latter is a very important item when it comes down to figuring on running a mine on an economical basis.

Trinity.

SHORT SEASON.—Trinity *Journal*, June 20: Miners generally are about completing the cleaning-up process. Trinity county never had such a short hydraulic mining season and it is fervently hoped never will have again. As a rule the claims paid well for the amount of work done, and the miners are by no means discouraged. All will rig up in good shape and "play for even" next year.

SATISFACTORY.—A partial clean-up at the Ward mine, on Oregon Mountain, shows that the gravel there contains a fair proportion of gold and indicates certainly that the season's work will be profitable though short on account of the limited water supply.

PAYING WELL.—Messrs. Day, Moore & Co. made another clean-up this week at their arastra at the Enterprise mine on East Fork with most satisfactory results. This mine has paid largely ever since it was struck and maintains its reputation for richness.

NEW RIVER.—Shasta County *Democrat*, June 17: A few days ago we met an old resident miner of Grass Valley, who had been to New River and was returning home, of whom we gleaned a few items: He found that there were about ten quartz mining operations going on in the district, one company having a 5-stamp mill, the others reducing their rock with arastras. About 5000 people had been in the district, first and last, and several hundred are there at the present time. The country is exceedingly rough, being broken into canyons, and not a great deal of level land. New River heads at Scott mountain, and along its broken slopes the mines are situated. The houses that have been put up in the district are generally substantial structures, built of sugar pine, as owing to the heavy snowfall it is necessary to make them strong. The quartz ledges are generally small, but a number of them are paying property. As yet it is an undeveloped country, expensive to live in, and our informant advises persons seeking employment at day's wages not to go there, for they will meet with disappointment.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, June 20: The feature of improvement in this mine since last week's regular report has been the good ore development in chambering out for the commencement and hoisting machinery for the winze about to be started on the 3,000 level to explore the ore body to a greater depth. As before stated, the point selected for this winze is in the south lateral drift from west cross-cut No. 2, and about 15 feet feet from the cross-cut. The ore vein at this point showed the greatest richness and concentrated strength, and the excavating of this winze chamber, 14 feet high by 28 feet wide, shows the vein to be wider and stronger at this particular point than it is 20 feet south or north of it. It is over 20 feet in width, and 10 or 12 feet of it is ore that will probably pay from $150 to $200 per ton. At any rate its real value will soon be practically ascertained, as it is being raised to the surface as often as practicable and shipped to Briggs' mill for reduction. It will take about a week yet before the winze chamber and other arrangements are completed and sinking actually commenced below the floor of the 3,000 level. Meanwhile the capacious airy gallery on the 2,400 level will be completed, connecting the main incline winze with the northwest drift running to the Savage incline. The north lateral drift from cross-cut No. 1, on the 3,000 level, is being actively pushed forward to connect with the lateral drift south from

cross-cut No. 2 and the winze chamber. The addition to the hydraulic pump, doubling its present capacity, will also be made in 30 days, giving positive security against any further trouble from possible increase of water.

CON. CALIFORNIA AND VIRGINIA.—Owing to repairs to the C. and C. shaft during the past week there was an interruption of the regular ore yield from the 1,750 level, being worked on company account, but the dump being full the mill shipments were continued as usual, giving average assays of about $18 per ton. From the 1,200 level of the Jones lease section the usual yield of about 1,000 tons was given, with average assays of about $12 per ton. The old Con. Virginia shaft is to be put in complete repair, and used for ore extraction, ventilation and development of the 1,300 level. Owing to the superior ventilation arrangements and air connections throughout this mine, as compared with former bonanza times when it took five men to a pick, owing to the great heat and vitiated air, a great deal more and better work is being done now than was ever possible before, and far poorer ore can be worked to paying advantage. The repairs to the C. and C. shaft, machinery, platform, etc., will be completed about Sunday, when work will be resumed through it as before.

SIERRA NEVADA.—The main north lateral drift on the 520 level is being steadily advanced in good working ground, 60 feet being added to its length during the past week, making 564 feet in all. No intention of crosscutting west at present.

GOULD AND CURRY.—On the 1,000 level the cross-cut east, near the Savage line, is being steadily advanced in good working ground, and near the north line a cross-cut west has been started to explore the vein in that direction.

WOODVILLE.—The stopes on the 400 level are holding out and promising well, about 10 tons a day being the regular product. This ore is of good grade, and is shipped to the Eureka mill for reduction.

CHOLLAR.—Exploration work has been suspended on the 3,000 level for the present, and the men put to work in the upper workings extracting ore from that point for milling.

CROWN POINT.—The regular yield of low grade ore from the upper levels of this mine, the Kentuck and Belcher continues, with no new features of importance to make mention of.

MEXICAN.—The joint Mexican and Ophir crosscut west on the 500 level is being steadily pushed ahead and another joint cross-cut started east.

OPHIR.—On the 500 level the upraise to connect with and drain the old Mexican shaft is progressing upward at the rate of about 20 feet a week.

YELLOW JACKET.—Nothing new to relate. The old stopes and chambers of the upper levels continue yielding plenty of low grade ore.

OVERMAN.—About 30 tons a day of fair grade ore are taken from the 226 level and shipped to the Vivian mill for reduction.

BALTIMORE CON.—Work is suspended in the mine at present, owing to the needed repairs to shaft and machinery.

BULLION.—The drift west on the 160 level still advances in promising vein porphyry and quartz.

ALTA.—Still yielding small bunches of good ore from the explorations above the 900 level.

Esmeralda District.

AURORA'S PROSPECTS.—Walker Lake *Bulletin*, June 20: A. E. Ann, the representative of an English syndicate, accompanied by W. Gaffany and P. N. Mackay, mining experts, returned from Aurora yesterday, where they have been, for the past week, examining some mining property, and it is believed, with a view of purchasing. They speak favorably of the mines, so far as investigated. The principal properties examined were the Silver Hill, Humboldt, Junietta and Esmeralda mines.

Osceola District.

GOLD.—Salt Lake *Tribune*, June 20: The Salt Lake stockholders of the Osceola Gravel Mining Company, who went to Osceola recently to witness the first clean-up returned last Thursday evening. Mr. J. R. Walker, one of the party, was accosted by a reporter soon after their arrival, and kindly gave a full account of the trip and the progress that is being made with the hydraulic monitor. No clean-up was made while the Salt Lake men were there as the bedrock has not yet been reached, and until it is reached it will be impossible to get the coarse gold which sinks down in the rocks. The clean-up will probably not be made for some weeks. Both Mr. Walker and Mr. Lawrence pronounce the new ditch the finest they have ever seen. It is seventeen miles in length, including a mile of flumes, and is supplied with water from five streams. These streams flow from a high range of mountains, upon which snow remains during the entire Summer, and the water supply, therefore, will not be materially decreased during the summer months. The ditch is at present carrying 1,000 inches of water, and 500 inches more are available. The bed of the ditch is hard gravel cement, which holds the water admirably. Its construction cost in the neighborhood of $100,000. The force of the stream thrown upon the gravel banks is said to be terrific, as 800 inches of water, with a fall of 350 feet, is forced through a 6½-inch nozzel. A smaller monitor will soon be put in operation below the large one, as the water can be used a second or third time, provided there is any placer ground below the present workings; the company owns altogether about 1,000 acres. While the Salt Lake party were there a temporary sluice-box was constructed and eight men were set to work shoveling dirt into it. They worked four hours and sixteen pennyweights of gold, or nearly $2 to the man, was the result. When it is considered that the monitor brings down a ton of dirt as quickly as a man can lift a shovelful, that there is an unlimited supply of water and almost inexhaustible gravel banks which are rich in gold, there seems to be no reason why wealth should not roll into the coffers of the Osceola stockholders. All of the gentlemen who went down are entirely satisfied with the prospects of the enterprise.

Sprucemont District.

THE FURNACE.—*Free Press*, June 19: From ex-Sheriff Taber who returned on Monday from Jasper, Sprucemont District, we gather the following items in regard to the new smelting furnace recently erected at that place. The furnace started up on the 27th of May and has been running steadily ever since, reducing about 14 tons of ore daily, and producing about $400 worth of bullion for each day's work. There are now over 600 tons of ore at the furnace and about the same amount on the dumps at the mines, which are situated three miles from the smelting works. There are also some 50,000 bushels of charcoal and 25 tons of coke at the furnace. The furnace is of 20-tons capacity, and employs 16 men. It is working finely, and is under the personal supervision of Mr. Andrew Harrell, with Mr. Small as foreman. There are 16 men employed at the three mines—Scorpion, Friday and Belt—operated by the company. Most of the ore comes from the Scorpion mine, though considerable work is being done on the other two. The Belt is being worked mostly for the lead ore it contains. Mr. Wardwell, who has the contract for hauling the ore from the mines to the furnace, has two teams running, and is delivering 20 tons of ore daily. He makes two trips each day—10 tons to the trip. The road between the two points is in good condition and of easy grade. The town of Jasper, where the furnace is, has become quite a little burg. There are now within its limits 2 eating houses, 2 saloons, 1 general merchandise store, 1 drug store, 1 butcher shop, 1 livery stable, and seven or eight families. A petition for a post-office and mail route has been forwarded to Washington, and in due course of time the citizens of Jasper will have mail communication with Wells, on the Central Pacific, 40 miles distant. Everything needed—fuel, timber, water, etc.—is handy and there is nothing in the way to hinder the furnace from running successfully, and the prospects for Jasper and surrounding country are exceedingly flattering.

ARIZONA.

KINGMAN.—Wallapai *Tribune*, June 20: Since January 1, 1885, there has been more ore shipped out of this district than a casual observer would suppose. The statement furnished us by the gentlemanly agent of the Atlantic & Pacific at this place, J. F. Brooke, shows that there has been 2,040,560 pounds of ore shipped up to June 16, or 1,020 tons. Of this amount Beecher & Co. shipped 268,842 lbs., W. H. Taggart & Co. 647,587 lbs., and we presume that J. W. Chamberlain shipped the balance, or 1,121,131 lbs. This shows a very healthy state of affairs in this district, more so than ever before, as all the ore shipped has paid well, whereas, last year a great deal of ore shipped did not pay expenses. The greater part of this ore has been taken from the vicinity of Stockton Hill, which is destined to be one of the liveliest camps on the Pacific Coast. 1,020 tons in five and a half months is a pretty good showing for a district that two years ago could not supply a 5-stamp mill with enough ore to keep it running three months in the year. Captain Hardy informs us that during the coming months the shipments will be largely increased. From the old dumps of the Cupel mine over 42 tons of good ore, running over 100 ozs. silver, has been sorted out by Messrs. Riley & March, and perhaps as much more will be extracted before the dumps are worked out. In place of the Schuykill, New London and Champion which produced so much last year, hundreds of claims that were then lying idle are now being or are about to be worked, those being worked producing a higher grade ore than has ever before been taken from them. Work has been suspended on the Lorena mine, on account of the large amount which has to be handled in its operation. Henry Raymond has six men at work on the Hibernia line, and has a pack train engaged in packing the ore to Yucca as fast as it is extracted. It is rumored that the Cerbat mill and mine will start up shortly with H. S. Carpenter as superintendent. We sincerely hope that this rumor will prove true. N. Amer brought three tons of ore down from the Silver King mine Wednesday, which he had worked at the sampling works. We did not learn the result. Joe Pomber and Joe Prisk are taking out some very rich ore from a claim situated between Todd Basin and Layne Springs, samples from the claim assay as high as 900 ozs. per ton. John Hughes and William Davis are sinking on the Constellation mine, situated about 1½ miles southeast of Cerbat, and are down about 90 feet. The ore body is improving and some very rich bunches are being struck. Eugene Torlott and John O'Brien have just shipped 5½ tons of ore from the Vanderbilt mine near Cerbat through Beecher & Co. to the Pueblo smelter. The ore will probably average $70 in gold and about 10 ozs. silver per ton. 15 feet of solid ore assaying 70 ozs. has been struck in the Signal mine on the 170-foot level. A cross-cut has been run cutting the ledge, and has exposed to view an immense body of ore. There is considerable excitement over the strike, and a mill will be put up immediately. The mine is owned by Messrs. Kimble Bros. & Co.

COLORADO.

WORK.—Elk Mountain *Pilot*, June 20: Work is progressing although quietly on the Richmond, Tip Top and Lady Joe in Dark canyon; on the Monitor, Great Western and Hawkeye, on Slate river; on the Eastman, P. Islander and Augusta, in Poverty gulch, and on the Daisy, Daisy extension, Chautauqua and High Tide, in Evans basin, besides many prospects in the same localities and a score or more in Irwin and on Rock creek, Brush creek and around Gothic.

POVERTY GULCH.—The Augusta mine will ship six cars of ore next week, which will be about double what it has been shipping. Mr. Gillette expects to ship a car a day regularly when the tramway is erected, up to which time the output will be from two to five cars a week. A force of 11 men are at work on the Tip Top mine in Dark Canyon. It is owned by the same company as the Richmond and will be systematically developed.

IRWIN.—Work on the Fairview, Forest Queen and Bullion King is being prosecuted with satisfactory results. The King shaft will be sunk as soon as surface water stops coming in so rapidly. Work will be begun on the Ruby Chief mine the first of next week to get the mine in shape to ship steadily. A new track of "T" rails will be laid in the tunnel and everything arranged for extensive working.

REDWELL.—The Grand Union mine in Redwell basin is developed by a tunnel 60 feet deep at which point it cuts the vein. Drifts have been run 30 feet in each direction on the vein which shows large bodies of ore, carrying lead, and a small percentage of zinc. No work has been done on the mine this winter, but Mr. Fitzgerald, one of the owners, has arrived from Silver Plume and informs us that work will soon be commenced upon it. It is one of four claims owned by Messrs. Fitzgerald, Miller, Burr and Faas, all of which will be worked through this tunnel. The Daisy lode in Redwell basin has been leased by the owners, Messrs. Fitzgerald, Miller, Burr and Faas, to W. H. Wilson, formerly of the Chrysolite mine in Leadville, and a Mr. Lawson of Socorro, New Mexico. The property will be worked continuously after starting which will be soon.

CRYSTAL CITY.—The Orphan Boy M. & R. Co. have started work upon the Silver Falls which shows a strong vein crossing Lost Trail creek, that carries copper and galena. The Detroit is being worked by the Squire also other claims which he is interested in. Andy Anderson has been doing work upon his Sheep Mountain property.

ORE.—Georgetown *Courier*, June 20: The Pelican-Dives is producing more ore than for a number of years previous. Nearly 60 men are employed. A 25-horse-power engine and pump will probably be placed on the Aliunde. The water at present greatly interferes with development. Extensive placer operations are being made in the vicinity of Breckenridge this summer. It is reported that another smelter will be erected near Idaho. Allen & Campbell are the projectors. The last shipment of ore from the Centennial consisted of nine tons, and returned $57.50 per ton. During the month of May 49 cars or about 700 tons of ore were shipped from the Georgetown depot, valued at $91,000, 16 of which went to Argo, 4 to Golden and 29 to Denver. The Terrible mill has been running steadily with satisfactory results, since the latter part of April, turning out about $1,000 worth of concentrates per week. Between 25 and 30 tons of raw material is treated daily.

IDAHO.

PLACERS.—Idaho *World*, June 20: This promises to be a better season than usual for placer miners. Water will hold out almost, if not quite as long as last year—and last season was good for water—and this year's work was commenced about a month earlier than last. George Cartwright, who is working placers in Campbell's gulch, in partnership with Jas. Hall and Wm. Barker, and is also interested with Riordan & Co. in ground between Noble and Campbell's gulch and in the Thorne creek ditch, says work will be carried on for sometime yet in both of these claims. Work was stopped in said claims the latter part of July last year. The Ritchie boys are still at work in their hydraulic claim between here and the Warm Springs, Plowman will have water for a few weeks yet. Buzzini & Co. have a number of large reservoirs, and by "corralling" the water can work twelve hours out of twenty-four until fall. A portion of this season this company has not been working as good ground as formerly, but it paid fairly. Recently they came onto ground that is as rich as that they have run off during previous seasons. Jo Hill, who gets water from the Thorn creek ditch, owned by Riordan & Co., stopped work about ten days ago. The Riordan Co. had no water to spare. A number of other claims on this side of the Basin are still running.

BONANZA.—*Courier*, June 20: Thursday we visited the Schearer & Radler bonanza in company with A. McConnell, Col. Magee and Alex Morland. The find is situated in a short "wet weather" gulch which puts into the Sacramento just below the mouth of Salt creek, and a few hundred yards below the Middle creek depot. The ledge matter is about six feet in diameter both horizontally and perpendicularly, and rests between well-defined walls of slate. The main body of quartz is of dark grayish hue, so hard as to almost bid defiance to drills, and pitches down under the hill at an angle of less than forty-five degrees. The very rich streak runs at present horizontally across the ledge and is from six to eighteen inches in width and contains a combination of gold and tellurium so rich that when the formation is broken it holds together as though it had been interwoven with wires and threads of gold—and so it has been by the deft hand of Nature. The incline sunk on the ledge is about 18 feet in length and the base of the face on the lode not over 15 feet, we should judge, from the surface. Enough has already been taken from the lode and is in sight, to ensure its lucky owners a fortune. John Langdell, of Bowlder, Colorado, has been installed superintendent of the mine and carefully selects the ore taken from the very rich pay streak and separates it into three grades. The entire ledge matter is highly mineralized and what is classed as the poorest rock will go $2,000 to the ton.

BULLYCHOOP.—Whit George, of the Bullychoop mines, came to town Monday, having disposed of his mining interests in that district. Whit informs us that the Foster & Potts toll road is now completed to within three miles of the principal mines in that camp, consequently the whole road will be open to travel in a short time. He says for a mountain road it will be one of the best thoroughfares in the country. Upon the completion of this road two or three mine owners intend to erect milling machinery on their property. Whit thinks Bullychoop will be a lively camp this summer.

MONTANA.

BUTTE SMELTING CO.—*Inter-Mountain*, June 18: Work has already begun upon the new custom smelter on Silver Bow creek at the foot of Montana street. The furnace will be a cupel having a daily capacity of 60 tons. The Parrot company has nothing to do with the new enterprise, though several of the Parrot stockholders are identified with it. Mr. Murphy, who is now the assayer at the Parrot, will have charge of the new works. The name of the organization will be the Butte Smelting Co. It will smelt silver or copper ores at custom rates, or buy them at the smelter according to sample. The product will be a matte, carrying about 25 per cent copper, with varying proportions of silver. It is contemplated to have the works ready to begin operations on smelting ore about the 1st of August. No concentrator will be built at present.

BUTTE MINES.—*Miner*, June 20: Ground has been broken for the foundation of the new smelter, which is to be erected at a point south of the depot. The machinery for the smelter will be on the ground by the first day of July, by which time it is hoped that sufficient progress may have been made on the structure to begin the placing in position of the machinery. The capacity of the smelter will be 100 tons per day. Mr. Gaylord, the present manager of the Parrot Co., will be the manager. Mr. Murphy will be the superintendent, and Mr. McArthur, one of the furnace bosses of the Parrot, will have charge of the smelting department. The Colorado smelter is running to its full capacity. It is contemplated to add shortly another calcine furnace to their already large establishment. The mines in the Burlington district seem to improve as depth is gained. Machinery is now being erected on the Patsy Clark group of mines. When completed the group will give employment to a great many miners and laborers. The Montana Copper Co. will shortly commence the erection of another furnace and stack. The shaft of the Colusa is being sunk to a depth of 800 feet, where it is expected a rich body of ore will be struck. The mine is one of the largest producers in the camp. No stoping now. The Anaconda is shipping from 450 to 500 tons of ore daily to its smelter in Anaconda. It is reported that the mine will be worked to its fullest capacity. Very little ore is now being taken out of the stopes. The Moulton stamp mill and mine are working day and night with the usual amount of ore. The Little Darling is producing some very rich ore, and will shortly be worked to its full capacity. The mine is a little darling, indeed. The Gagnon is producing its regular quota of ore, and shows up some fine bodies in the drifts and stopes. They are shipping some 26 and 30 tons a day to the Colorado smelter. Rell's stamp milling company is treating all the output from their mine, which is producing a high grade ore. The Parrot smelter will shortly be enlarged, as the company contemplates putting in a new furnace of a 100-ton capacity. This company is now mining and treating over 300 tons of ore per day, all from their mine, the Parrot. The Lexington people have just completed and set in place their new set of boilers, which will give them additional hoisting facilities. The mill and mine are worked to their full capacity, producing over $80,000 per week. The Alice is working to its full capacity. The company is putting in a new set of boilers. It is expected that the Bluejay mine, in the Burlington district, will start up in a few days. Burlington is shortly to have a stamp mill, as parties are looking out for a location.

NEW MEXICO.

ORGAN.—Rio Grande *Republican*, June 20: The concentrator is doing some good work at the Silver Gem. Work still continues on the Silver Star. Clark and Brown are still at work on the Wilde Oscar. A few men are at work on the Galloway, and are taking out some fine ore. A cave was struck in the Bennett mine seventy feet deep and a hundred feet long. It is reported that the ore in the cave is very rich.

GOLD HILL.—Cor. Silver City *Enterprise*, June 16: Since my last unusual activity has been the order of the day, and claim owners wear smiling faces accordingly. The day of regeneration is at hand. Since the advent of western mining men who have the experience and funds sufficient to back their judgment, no fears need be entertained for the future of Gold Hill. It is only a question of time when an express office will be needed here to handle our bullion and cash our checks. The mining outlook never was better nor have we any recollection of the time when California men were so eager to invest in New Mexico mines as at the present time. Parties are expected in here shortly from Tombstone, and also from Kansas City, both having in view the purchase of mining properties. Claim owners have awakened to a realization of the fact that mine prices cannot be obtained for prospect holes, and are willing to change their figures accordingly.

OREGON.

THE BIG YANK.—Oregon *Sentinel*, June 20. This much talked of mine at Galice creek has now taken a boom, and with present indications will soon astonish the natives with its richness. While at Grant's Pass this week we learned that the California parties who had it in bond, had ordered prospecting stopped, being well satisfied with assays made from numerous portions of the mine, and declare their intention of taking the mines for the amount of the bond. A large stamp mill has been ordered and it will not be long before Galice creek will be one of the liveliest mining camps ever found on the Pacific Coast. Prospecting on other ledges continues and rich discoveries are promised from other well-known ledges in that section.

PROSPECTING AT WOODVILLE.—About 18 months ago, while I was hunting, I picked up some favorable looking quartz, and after looking some time I found the ledge and gave a party half interest to put on the first year's assessment. After working some time and the ledge seeming broken, work was suspended and nothing has been done with it since. I received assays from J. H. Fisk of the rock, none less than $40 and some as high as $150 to the ton carrying some silver. About the same time Dr. Studney and W. J. Stanley located what is known here as the old copper lode one and a half miles below Woodville. Though the ore is not high grade it will no doubt be a paying mine. The ledge runs about 10 degrees east of north. Having received information from T. D. Jervitt last spring during his stay in Woodville, that some rich silver ore had been found in this locality, I encouraged O. Boyd an old Colorado prospector to spend some time looking for the ledge. He soon found some good float ore and a small vein running 100 ounces in silver. After looking at the ground, he located on a ledge running quartering across the small vein. The ledge is called the Oliver Boyd and runs 20 degrees west of north, and lays between porphyry and granite, and the owners think they have a bonanza. The Little Galena owned by Otto Lind, H. Kinney and others is about one and a half miles west from the Boyd claim and runs nearly north and south and assays from $25 to $50 in gold and silver to the ton. On upper Grave creek about 20 miles from Woodville, the Blalock Bros. have a large and promising ledge running northwest and southeast. The assay shows 20 per cent copper and from $8 to $16 in gold and silver. Samples of ore from these ledges can be seen at T. T. McKensie's of your town.

NOTICE TO ARCHITECTS.

$250 for Plans.

THE DIRECTORS OF THE INSANE ASYLUM OF Arizona propose to erect an asylum of sufficient size and capacity to accommodate 100 patients, near the City of Phœnix, in Maricopa county, Arizona Territory, and for the purpose of obtaining plans and specifications suitable for such an institution, hereby make the following offer to Architects, namely:

FIRST. The Directors will receive plans and specifications offered by Architects, and place on file with their Secretary, N. A. Morford, at Phœnix, Arizona, on or before the 3d day of July, 1885.

SECOND. On said day, or as soon thereafter as practicable, the Directors will examine all the plans and specifications offered, and if any one of them shall be approved by the Directors and adopted for the construction of said asylum, they will pay to the party offering the same, two hundred and fifty dollars; but the Directors reserve the right to reject all plans and specifications offered.

THIRD. The material to be used in the construction of the buildings will be brick, iron, and wood, unless some different material shall be found which is more desirable and which can be supplied for an equal cost.

FOURTH. The cost of the whole construction must not exceed $45,000.

FIFTH. The buildings must be complete in themselves, but so arranged that their capacity may be largely increased with facility by additions without changing or removing the structure.

SIXTH. The prices of material and labor at the site of the building will be approximately as follows, viz.:

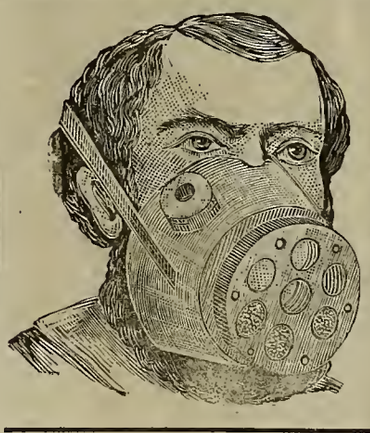
Lumber per M., finishing and flooring	$65 00
Lumber per M., rough	45 00
Brick laid in wall, per M	14 00
Rockwork for basement, per perch	3 50
Iron, per lb	4c
Lime, per 1,000 lbs	2 00
WAGES. Carpenters, per day	4 00
Bricklayers, per day	5 00
Laborers, per pay	2 00
Painter, per day	4 00
Plasterer, per day	5 00

SEVENTH. The climate is temperate, but the mercury ranges high during about three months of the year, and then it drops to the freezing point in winter, occasionally, and hence provisions must be made against extremely warm as well as cold weather. The temperature ranges approximately as follows:

	Maximum, Means for 1884.	Minimum, Means for 1884.
January	70.1	31.1
February	70.5	34.5
March	76.1	32.9
April	85.2	40.8
May	03.4	49.1
June	103.4	55.7
July	109.0	66.3
August	104.2	63.2
September	89.9	48.3
October	93.0	51.3
November	83.2	40.1
December	67.8	36.1

All plans and specifications sent by mail or express must be prepaid and marked "Plans and Specifications for an Insane Asylum," and addressed to the Secretary of the Directors of the Insane Asylum, Phœnix, Maricopa County, Arizona.

Plans and Specifications will be returned, if required, on receipt of cost of transportation. N. A. MORFORD,
Sec'y Board of Insane Asylum Directors.



PATENT
LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation

The most perfect appliance for people engaged in **Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding,** and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3.00 each or $30.00 per dozen. Sent post-paid to any address on receipt of price.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING JUNE 16, 1885.

320,048.—OATMEAL MACHINE—Geo. Cottrell, S. F.

320,049.—GRAPE STEMMER AND CRUSHER—A. David, S. F.

320,054.—MILL STOCK FEEDER—Downie & Eisan, Marysville, Cal.

320,055.—DIRT SCRAPER—Dusy & McCall, Selma, Cal.

320,066.—FLOOR AND SIDEWALK CONSTRUCTION—P. H. Jackson, S. F.

320,077. FEED WATER HEATER—Geo. H. Malter, S. F.

320,082.—FAN ATTACHMENT FOR VEHICLES—R. Meacham, Chico, Cal.

320,382.—CAR AXLE LUBRICATOR—R. Munro, S. F.

320,285.—ELECTRIC IGNITER FOR GAS ENGINES—D. S. Regan, S. F.

320,201.—VEHICLE AXLE—Charles Wonacott, Bishop Creek, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

OATMEAL MACHINE.—Geo. Cottrell, S. F., No. 320,048. Dated June 16, 1885. This invention relates to that class of machines for cutting oats to form oatmeal or grits, in which a shaking movable screen is employed in connection with an underlying cutter-head; and the invention consists in a combination of devices for accomplishing the object.

BOILER TUBE EXPANDER.—Michael Cashin, S. F., No. 319,559. Dated June 9, 1885. This tube expander consists of a cylindrical block divided into sections and carrying rollers, a centrally inserted wedge, and a screw for adjusting it to expand the block, an encircling spring to act against the wedge and bold the block together, suitable guides for the expanding block, and a lever, pawl and ratchet mechanism for turning block, together with certain details of constructions.

FAN ATTACHMENT FOR VEHICLES.—Randall Meacham. Chico, Butte Co., Cal. No. 320,082. Dated June 16, 1885. This is an attachment for buggies, carriages and other vehicles intended for general riding purposes; and it consists in a fan mounted in the top of the vehicle, and operated by power transmitted from the wheel. The object is to make riding in warm weather and over dusty roads more pleasant by creating a constant breeze or circulation of air within the vehicle.

MILL-STOCK FEEDER.—Geo. Downie and Albert F. Eisan, Marysville, Yuba county, Cal., No. 320,054. Dated June 16, 1885. The object of this automatic feeder is to supply mill-stock to a grinding, separating or purifying machine. The invention consists in a feed-board, mounted, which is connected with a purifier or rolls, as the case may be, said hoard being located under the hopper and adapted to feed the middlings and stuff into the shaker, by which it is discharged into the machine with which it is connected.

BOLTING REEL.—Francis Ferrier, Vallejo. No. 319,572. Dated June 9, 1885. This invention relates to a new and useful sieve for screening, bolting or sifting any substance, and particularly to that class of sieves used in bolting flour, and known as flour-bolt reels. It consists of a corrugated sifting surface and in the means for obtaining it in a flour-bolt reel. The object is two-fold; first, to be able to obtain a maximum sifting surface in a minimum space; and second, to produce a vibratory motion of the sifting surface by reason of the corrugation.

VEHICLE AXLE.—Chas. Wonacott. Bishop Creek, Inyo Co. Assignor of one half to J. H. Bulpit. No. 320,201. Dated June 16, 1885. This consists first, in a supplemental sleeve, which is fitted upon the spindle so that it receives all the wear, and may be removed and replaced by a new one when worn out. It also consists in a peculiar construction of the inner end and shoulder against which the box on the wheel-hub turns, in a disk secured to the inner end of the box within the end of the hub, and in a means of discharging any sand or dirt which may work itself inside the disk.

FLOOR AND SIDEWALK CONSTRUCTION.—P. H. Jackson, S. F. No. 320,066. Dated June 16, 1885. In the construction of basement extensions it is important to obtain all the head-room possible, and for this purpose, when on account of water or other reasons it is not feasible to dig deep, expensive iron sidewalks are used to avoid the deep brick or concrete arches which would otherwise have to be built, and which would he so low as to greatly interfere with the usefulness of the space beneath. In Mr. Jackson's improved construction he dispenses with the usual continuous brick or concrete arches which support sidewalks, and gains the room they take up in hight, the sidewalks being of the usual thickness. The vault beams may be also made lighter and at less cost, there being no heavy, continuous brick or concrete arches to be sustained by them, and which from their depth would occupy space which in Mr. Jackson's construction is made available.

GRAPE-STEMMER AND CRUSHER.—Auguste David, S. F., No. 320,049. Dated June 16, 1885. This consists in a casing or sbell on which is mounted a rotating shaft carrying a series of spirally-arranged arms, a hopper adapted to feed the bunches of grapes to the arms, and underlying laterally-concaved grating through which the grapes pass; a series of parallel spaced bars on the under surface of the swinging cover of the casing against which the arms beat the stems, a horizontal screen under the grating, a chute under the screen, and suitable crushing rolls under the chute. The patent also covers certain details of construction relating to the points of feeding and discharge.

PATTERN-MAKING MACHINE.—Carlos Tourigne, S. F. No. 317,687. Dated May 12, 1885. This is a machine for laying or cutting out patterns, either directly from the object to be fitted, whether of a curvilinear or plane surface, or from another pattern. The invention is applicable to the making of all patterns, but is more particularly intended for laying or cutting out the pattern for uppers of shoes, so they may be conformable to the last in every particular, either measurement for measurement or proportionately. The invention consists in the employment of a string, cord or other flexible line, so mounted and guided and centered as that one end may be made to follow the outline of the body while lying upon and moving over in perfect parallelism with its curvilinear surface, and its other end may receive motion from the first end to register or indicate its movements, thus delineating them both in outline and measurement and forming the pattern. The invention further consists in a suitable frame, an adjustable last-holder, a movable and adjustable string-holder on one side and a movable and adjustable pencil or knife holder on the other, a mechanism for transmitting the movements of the string to the pencil or knife, a means for proportionately altering the movement of the pencil or knife, a swinging table for the work, and various details of construction.

Mining Share Market.

Now that Hale and Norcross is raising ore and shipping it to mill, with prospect of more to come, there is a more hopeful feeling among those who pin their faith on the Comstock.

Speaking of bonanza indications, the *Enterprise* says, the ore vein on the 3,000 level of Hale and Norcross has been more irregular and variable than where it was found on the levels above, from the 2,600 level down. It has increased in width, general size and volume, so to speak, yet at the same time has shown more disposition toward concentration in large bunches or bodies of richer ore. These bunches are connected, yet show eccentric turns and variations, whirling away to the westward unexpectedly or bulging or enlarging to the eastward. Superintendent Patton, whose well-known and eventful experience in the development and working of the bonanza mines of the north end gives his opinion more than ordinary weight, considers the irregular features above related as of the most favorable character for the development of a first-class ore body or bonanza. In fact, his opinion is corroborated by that of other observant and experienced men. It simply shows a disposition of the ore-bearing vein matter to abandon regularity of stratification and concentration at some point in the great ore channel. The general character of the inclosing walls or surroundings at this point of depth indicates increased strength of body and mineralization apparent nowhere else along the whole Comstock lode at a similar depth.

Within the next thirty days the duplicate, or other half-section of the big hydraulic pump in the Combination shaft, already in course of construction in San Francisco, will be received and placed in position, thus doubling the drainage capacity.

The low grade ore bonanzas of the north end as well as of the south end continue their regular daily yield, and development and exploration work is going ahead all along the lode as usual.

Bullion Shipments.

Clip, June 16, $3,550; Christy, 16, $1,578; Hanauer, 16, $2,800; Queen of the Hills, 16, $1,300; Honerine, 17, $5,100; Hanauer, 17, $5,600; Queen of the Hills, 19, $1,200; Hanauer, 19, $5,800; Ontario, 19, $25,590; Christy, 19, $1,703; Queen of the Hills, 20, $1,300; Hanauer, 20, $2,600; Stormont, 21, $2,780; Hanauer, 20, $2,450. The banks of Salt Lake City report the receipt for the week ending June 17, inclusive, of $22,958.52 in bullion and $9,700 in ore; a total of $32,658.52.

AXLE LUBRICANT.—Those who have not yet used the plumbago lubricant of the Dixon Co. for vehicles and machinery, will do well to write J. G. Allen, Sole Agent for Pacific Coast, No. 106 Davis Street, mentioning this notice.

A $3.50 Premium for $1 to Subscribers of this Paper.

Picturesque Californian Homes.

A VOLUME OF

Forty Plates, Plans, Details and Specifications of Houses.

Costing from $700 to $15,000, and adapted to Families having Good Taste and Moderate Means.

CITY AND COUNTRY HOMES.

This work is designed to meet the wants of that large number of persons who have but a limited amount of money at their command, and in building a home wish to use it to the best advantage. Drawn by Samuel and Joseph C. Newsom, Architects, San Francisco, who have taken much pains in its preparation, and confidently assert that mechanics, clerks, salaried men, workingmen of every calling contemplating building, carpenters and builders in cities, towns and villages, will find this book a useful aid, worth many times its cost in the information and practical suggestions which it gives.

The Plans are clear, and finely drawn on Lithograph Plates, and handsomely printed; size, 9x13 inches.

Subscribers to this paper (old or new), who pay one year in advance of the date of application for this premium, can have the same by paying $1 additional. Sent by express unpaid, or on receipt of $1.10 postpaid.

CRYSTAL SPRINGS.

THIS DESIRABLE

Summer Resort and Sanitarium,

Situated on Howell Mountain, 2½ miles N. W. of St. Helena,

IS OPEN

To those seeking health, or rest and recreation. Scenery is unsurpassed. Air balmy, free from fogs and malaria. Water pure and soft, from a fine spring. Bathing facilities first-class. Good Gymnasium. Carriage and horse-back riding. An experienced physician and surgeon, with gentlemen and lady assistants, will attend all cases needing his care. Excellent facilities for treatment. Terms reasonable. Send for Circular or "Come and see." Address RURAL HEALTH RETREAT, St. Helena, Cal.

BOWENS ACADEMY,

University Avenue, - Berkeley, Cal.

Preparatory, Commercial, and Academic Departments.

NEXT TERM BEGINS

Monday, July 20, 1885. Send for Circulars to T. STEWART BOWENS, B. A., T. C. D., Principal.

....SOLE MANUFACTURERS OF....

KENDALL'S PATENT QUARTZ MILLS.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that is claimed for it and give entire satisfaction.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,
218 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

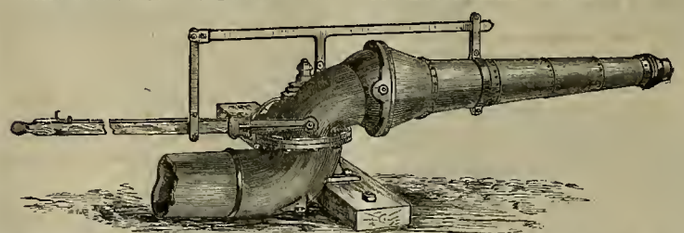
JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO, CAL.

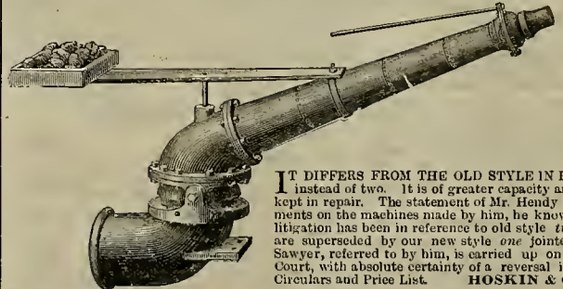
IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

☞ PRICES furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.



THIS CUT REPRESENTS OUR

IMPROVED

HYDRAULIC

MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. ☞ Send for Circulars and Price List. MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—California.
A. C. KNOX—Ventura and Los Angeles Co's.
G. W. INGALLS—Arizona.
E. L. RICHARDS—San Diego Co.
F. W. SMITH—El Dorado and Placer Co's.
W. B. TURNER—Oregon.
GEO. MCDOWELL—Fresno and Tulare Co's.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

NEW BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific Slope of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") which have been successfully popular) is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part 1, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion: Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Xanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salts; Appendix to Part II; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, $1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

The are much needed books for miners and other practical men, by an intelligent miner and assayer and careful writer. They are invaluable for the mill and mine worker, and equally good for scientific experts. They are thoroughly practical books.

Gold Mines For Sale.

Two small gold mines for sale, in Kern county, California. Ore has paid by arastra $20 per ton. Worked to a depth of 60 feet. The vein is 15 inches wide. The mines are within seven miles of the Southern Pacific Railroad. The owner is not in a position to develop them without aid. The purchase price is very reasonable and there is a good opening for any one to take hold of the claims and work them. Address W. L., P. O. Box 2361, San Francisco.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in it because it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

ADDRESS all correspondence to the name of the paper or firm, as either of the publishers or editors connected with the office are quite likely to be absent at times.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for invoutors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Clear Lake and Calistoga Stage Line.

Carrying U. S. Mail and Wells, Fargo & Co.'s Express.

Summer Arrangement, 1885.

SAN FRANCISCO TO LAKEPORT
In 11 Hours.

Passengers leave San Francisco daily by Ferry lines from Market Street wharf at 8 A. M., arriving at Calistoga at 11:15 A. M. Coaches leave Calistoga at 12 M. daily—Sundays excepted. On Tuesdays, Thursdays, and Saturdays leave Calistoga for Lakeport via Middletown, Glenbrook, Kelseyville, Anderson Springs and Soda Bay. Returning alternate days.

THIS IS THE MOST DIRECT LINE FROM SAN FRANCISCO TO LAKEPORT, and the most picturesque and romantic route on the Coast. From Mt. St. Helena it affords the traveler a beautiful view of the far-famed Napa and Russian River valleys and mountains of the Coast Range; and from Cobb Mountain the great Clear Lake region in front and the Pacific in the distance. This line connects with stages for ADAMS, SIGLER, and HOWARD SPRINGS and SODA BAY. On Mondays, Wednesdays, and Fridays stages leave Calistoga at 12 M. for MIDDLETOWN, GUENOC, LOWER LAKE and SULPHUR BANK, returning alternate days. This line connects at Lower Lake with stages for Seigler, Howard, Adams, and the celebrated BARTLETT SPRINGS. THESE LINES ARE STOCKED WITH SIX-HORSE CONCORD COACHES, and handled by the most careful and experienced drivers.

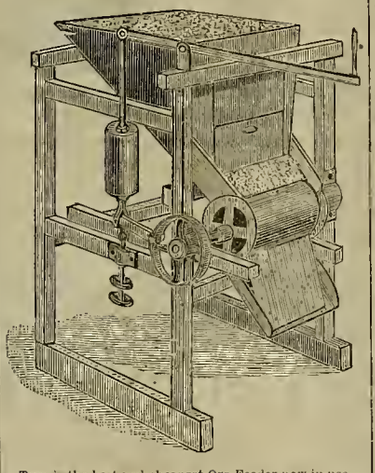
TICKETS for sale in Lakeport at W. W. Greene's Hotel, John Clark, Agent; Kelseyville, at Wells, Fargo & Co.'s office, A. A. Slocum, Agent; at C. P. R. R. office, Market Street Wharf, also at No. 2 New Montgomery Street, San Francisco, Sam Miller, Agent. Round Trip Tickets from Lakeport to San Francisco and return, TWELVE DOLLARS. Single trip tickets, $6.50.

Passengers for SODA BAY via Calistoga, purchase the Lakeport tickets for $6.50. Fare to LAKEPORT, KELSEYVILLE and SODA BAY all the same.

D. WELLINGTON, Prop.
W. N. HARLEY, Agent. Calistoga, Cal.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

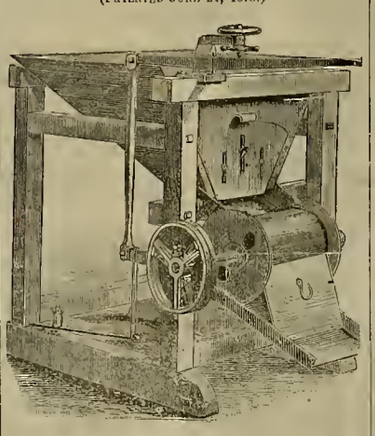
Golden State and Miners' Iron Works.

Sole Manufacturers,

327 First Street, SAN FRANCISCO, CAL

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)



This form of Ore Feeder is well adapted for its peculiar work.

Manufacturere of the Celebrated "Challenge" Ore Feeders for wet and sticky ores; also "Stanford Improved" Ore Feedere and Tullock's Ore Feeders for dry ores.

☞ Prices furnished upon application to

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

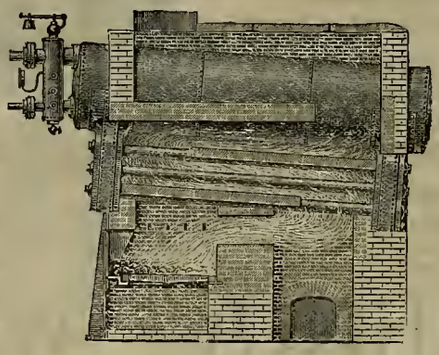
316 California St., San Francisco.

HEINE PATENT SAFETY BOILER.
RISDON IRON AND LOCOMOTIVE WORKS.
Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.
FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.

To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

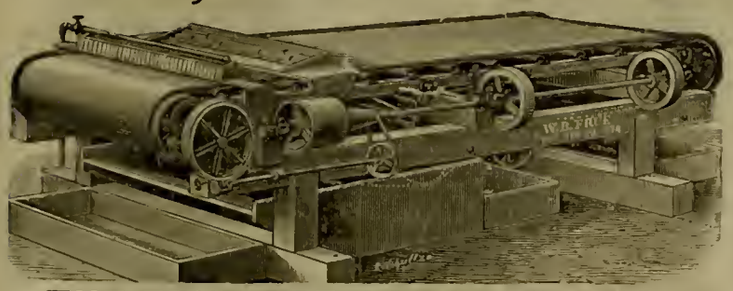
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1880, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

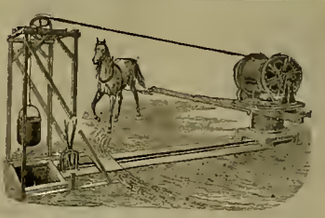
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,

252 Market Street, San Francisco.

Successful Patent Solicitors.

As Dewey & Co have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Satisfactory, Etc.

NOGALES, A. T., May 27, 1885.

MESSRS. DEWEY & CO., *Gents*:—Yours of the 18th of May enclosing notice of allowance of my application for a patent for "Process of Treatment of Nickel and Cobalt Ores," was duly received. It is extremely satisfactory, and I must say I am surprised at the rapidity with which you have accomplished a result which I expected would have taken six months or a year to reach.

Yours, very respectfully, C. H. AARON.
